A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION

OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES,

VOLUME VII.

NEW YORK:
AMERICAN BOOK EXCHANGE,
764 BROADWAY
1881

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA.** The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

GRANDEE'S (Span. *grandes*), the name by which the most highly privileged class of the nobility of the kingdom of Castile has been known since the 13th century. To this class belonged the whole of that very powerful portion of the nobility who, from their wealth, were called the *Ricos Hombres* by pre-eminence; and to whom, moreover, the crown had granted the right of bearing a banner, and of gathering mercenaries around it on their own account. The members of the royal family were as such included amongst the grandees. The honors of the grandees were hereditary; they held lands from the crown on the tenure of military service, being bound to produce a certain number of lances, each lance being represented by a knight with four or five men-at-arms. The grandees were exempted from taxation, and could not be summoned before any civil or criminal judge without a special warrant from the king. They were entitled to leave the kingdom, and even to enter the service of a foreign prince at war with Castile without incurring the penalties of treason. Besides these privileges, which were common to them with the rest of the higher nobility, the grandees possessed several which were peculiar to themselves, or which they shared only with the so-called "Titulados"—the counts and dukes. Of these must especially be mentioned the right in all public transactions of being covered in the presence of the king. The king addressed a grandee as *mi primo*, "my cousin-german;" whereas any other member of the higher nobility he called only *mi pariente*, "my relative." In the national assemblies, the grandees sat immediately after the prelates and before the titled nobility (titulados). They had free entrance into the palace, and into the private chambers of the monarch; and on the occasion of religious solemnities, they had their place in the chapel royal next to the altar. Their wives shared their dignities, the queen rising from her seat to greet them. Under Ferdinand and Isabella, cardinal Ximenes succeeded in breaking the power of the feudal nobility so completely, that by the end of the 15th c. the privileges both of the grandees and of the rest of the higher nobility were almost wholly abolished. Ferdinand's successor, Charles V., who considered it still necessary to bind to his party some of the nobles, and to reward others for the important services which they had rendered him, contrived out of an independent feudal nobility to construct a dependent court nobility. Gradually three classes of grandees arose out of this merely nominal nobility. It was the privilege of the first class to be commanded by the monarch to be covered before they had begun to address him; the second class received this command as soon as they had finished their address, and heard the king's reply with covered head; but to the third class it was addressed only after they had already listened uncovered to the royal reply. All grandees had the title *excellency*, and sentries were bound to present arms to them. By the revolution and under the government of Joseph Bonaparte, the dignities and privileges of the grandees were entirely abolished; but they were partially restored at the subsequent restoration, though no very important privileges were bestowed on them. According to the constitution of 1875, grandees are members of the senate or upper house in their own right.

GRANDFATHER. A grandfather is not liable at common law in England to maintain grandchildren; but if they are destitute, and are relieved by the parish, the parish may, under the statue 43 Eliz. c. 2, call upon him, if able, to contribute to their support. In Scotland, the liability exists at common law, and is enforceable without the aid of a statute if the father, who is primarily liable, is unable to maintain the children.

GRANDE RONDE, THE, a valley in Oregon, in Union co., near the n.e. corner of the state drained by the river of the same name, and bounded on the w. by the Blue mountains. In the valley are about 430 sq.m. of fertile land, and abundance of timber is found in the surrounding hills.

GRAND FORKS, a co. in n.e. Dakotah, w. of the Red river of the n., organized after the census of 1870, about 2,270 sq.m.; surface is nearly all prairie, and timber is scarce. The region is very little settled. Co. seat, Grand Forks.

GRAND HAVEN, a small but rapidly increasing t. in the state of Michigan, U.S., is situated on the eastern shore of lake Michigan, at the mouth of Grand river, and forms

the western terminus of the Detroit and Milwaukee railroad, which has here a most extensive depot and pier 3,000 ft. long extending into the lake. It has a spacious and excellent harbor, with a depth of from 30 to 50 feet. It exports timber, fish, leather, gypsum, stucco lime, and flour. The exports have already, in some years, exceeded one million dollars in value. Pop. '70, 3,700.

GRAND HAVEN (*ante*), a city and seat of justice of Ottawa co., Mich., on Grand river, where it falls into lake Michigan; 112 m. n.e. of Chicago, on the Michigan lake shore, and the Detroit and Milwaukee railroads; pop. 4,363. It has a good harbor, a court-house, about a dozen churches, many lumber mills and other manufactories. A magnetic spring is much visited in the summer season.

GRAND ISLE, the n.w. co. of Vermont, bordering on Canada and on lake Champlain, intersected by the Vermont central railroad; 80 sq.m.; pop. '80, 4,124. Within the territory are several small islands in the lake. The surface of the co. is uneven, and the soil fertile; productions, oats, hay, wool, and butter. Co. seat, North Hero.

GRAND JURY is the assembly of good and sufficient men, summoned by order of the sheriff to attend every sessions of the peace, and every commission of oyer and terminer and general jail delivery in England, for the purpose of inquiring into the charges for offenses, and of returning to the court their delivery thereon. The institution of the grand jury dates back to the earliest period of English history, having been in use among the Saxons. By a law of Ethelred it is enacted, "Exeant seniores duodecim thani, et præfectus cum eis, et jurent super sanctuarium quod eis in manus datur, quod nolint ullum innocentem accusare, nec aliquem noxium cælare."—Wilkins, *Leges. Ang. Sax.* 117. From this enactment, it appears that the number of the grand jury was originally twelve; but we learn from Bracton that, in the time of Henry III., it was the practice to return four knights for every hundred, who elected twelve other knights, or else twelve *liberos et legales homines*, to take part with them in the inquest. Towards the latter part of the reign of Edward III., in addition to the inquest for the hundred, the sheriff was required to return a panel of knights for the whole county. This jury was called *le graunde inquest*, and made inquiry for the county, while the jury for the hundred inquired for its own district only. After the establishment of the *graunde inquest*, the practice of summoning a jury of the hundred gradually went out of use; but until 6 Geo. IV. c. 50, it was deemed necessary that some of the grand jury should be summoned for every hundred. In the present day, the grand jury must consist of not less than twelve, or more than twenty-three members. A grand jury is summoned for every assize, and for the quarter-sessions in counties and burghs. It is not necessary that grand jurors should be freeholders; they may be leaseholders or ratepayers, but often are gentleman of wealth. The qualification of grand jurors is fixed by 6 Geo. IV. c. 50, and is the same as that of the petit jury. See JURY TRIAL. Town-councilors of a burgh are exempt from serving on juries within the burgh. An Irish peer, who is a member of parliament, is liable to serve on the grand jury at assizes. An alien cannot serve on the grand jury unless he has been naturalized. In Middlesex two grand juries were summoned every term, and sworn before the senior judge of the queen's bench, but this is discontinued unless on special occasions. After having the oath administered, and receiving a charge from the judge, they retire to their room, and the various indictments, which are called bills, are laid before them. The duty of the grand jury is simply to inquire whether there is sufficient *prima facie* evidence to require a trial. For this purpose, they may require the same evidence, written and parol, as may be necessary to support the indictment at the trial. But in practice, having ascertained that the crown has a sufficient *prima facie* case, they return a true bill, the prisoner's evidence being reserved for the trial. Witnesses are sworn on their examination before the grand jury by an officer appointed by the court. When the jury have come to a conclusion, the clerk indorses on the indictment *a true bill* in case the jury, or a majority of twelve, are satisfied that the case is sufficiently strong. In case they are not satisfied, the indictment is indorsed *not a true bill*. The foreman, accompanied by one or more of the jurors, then carries the indictments into court, and presents them to the clerk, who states to the court the nature of the charge and the indorsement of the jury. A bill having been thrown out by the grand jury, it cannot be preferred to the same grand jury during the same assizes or sessions. The grand jury usually serve for the whole session to which they are summoned; but in an emergency, as where a serious crime has been committed, and the prisoner brought in after the jury has been discharged, it is competent to swear a new jury. It frequently happens at assizes that, an offense having been committed before the grand jury have been discharged, a bill is immediately sent before them, on which they make their return; so that the case is disposed of in a few days, or even a few hours, after commission of the offense.

Although the grand jury has often been complained of as a somewhat superfluous step in the prosecution of offenses, and as no longer required, yet it provides an additional safeguard to the liberty of the subject in all cases. It has, however, been proposed to abolish it when the case has been already before a magistrate, who has like duties to perform.

In Scotland there is no grand jury; the duty of investigating and bringing to trial in that country being assigned to a public prosecutor. See ADVOCATE, LORD.

GRAND JURY (*ante*), a body of men summoned by a sheriff whose function it is, upon such evidence as the attorney of the state may present, to determine whether persons accused of crime, shall be indicted and tried therefor, and to inquire into such other matters as may be confided to them by the court, or come to their knowledge. They do not examine witnesses for the defense, for it is not their duty to find a verdict, but only to decide if there is *prima facie* evidence of guilt, such as to warrant a trial. In all essential particulars this institution in the United States is the same as it is in England, but upon minor points, there are in practice some differences. The number of men required to constitute a grand jury is not the same in every state, but varies from 12 to 23. The court may in its discretion select the foreman or allow the jurymen to do so. The foreman first, and then the other members of the jury, take the following oath: "You do swear (or affirm) that you will diligently inquire, and true presentment make, of all such articles, matters and things as shall be given you in charge, or otherwise come to your knowledge, touching the present service; the commonwealth's counsel, your fellows, and your own, you shall keep secret; you shall present no one for envy, hatred, or malice; nor shall you leave any one unpresented for fear, favor, affection, hope of reward or gain; but shall present all things truly, as they come to your knowledge according to the best of your understanding." Having been sworn and received a charge from the court explanatory of their duties, they retire to their room. The foreman presides, and it is usual to appoint one of the members as secretary, to keep a record for their own exclusive use. Bills of indictment against offenders are then laid before them by the state's attorney, and on the backs of the same are written the names of the witnesses by whose testimony they are supported. The witnesses are examined under oath, and if their testimony is deemed sufficient in any case to establish a fair probability of guilt, the foreman writes on the back of the indictment, "A true bill," signs his name and affixes the date. If the evidence is not sufficient, he writes on the back of the indictment the words "Not a true bill," or other words meaning the same thing. To find a true bill 12 of the jury must concur. Witnesses misbehaving themselves must be reported to the court, which may commit them for contempt if the offense is sufficiently grave. The jury must attend until discharged by the court.

GRAND LAKE, a large but shallow body of water in Louisiana, emptying through a tortuous lagoon into Atchafalaya bay.

GRAND LAKE, sometimes called Schoodic lake, in Maine, on the border of New Brunswick, the greater part in Washington co. Its waters pass into St. Croix river.

GRAND MANAN, or MENAN, an island in the Atlantic off the Maine coast, belonging to New Brunswick and embraced in Charlotte co.; pop, '71, 1,867. It is about 20 by 5 m. with abundance of timber, and excellent facilities for ship building. Fishing is one of the leading occupations of the inhabitants.

GRAND MASTER (Lat. *magnus magister;* Ger. *Hochmeister*), the title of the head of the military orders, the hospitallers, the templars, and the Teutonic knights; see these articles. The title originally borne by the superior of the hospitallers was simply "master" (*magister*); but in 1268 Hugh de Reval took that by which they are since known—grand master, *magnus magister*. In the Teutonic order, the title "master," with different modifications, was applied to the several superiors of the order in the various countries. Thus, the superior of Germany was styled *teutsch-meister*, "German master." The superior of Livonia was called *heer-meister*, "military master." In all these orders the office of grand master was held for life. The name was also used in the Dominican order.

GRAND MONADNOCK, a mountain in Chelsea co., N. H., rising 3,718 feet. It is an isolated peak, and a conspicuous landmark, offering from the top a wide and picturesque view.

GRAND PENSIONARY. Formerly the syndic of each of the important towns of Holland was termed a pensionary, and the state-secretary for the province of Holland, a grand pensionary. Until the time of Olden Barneveldt (q.v.), the grand pensioner was also advocate-general for the same province. He had no vote in the assembly of the states, and could only bring forward the subjects of discussion. He, however, collected the votes, wrote the decrees, read the letters addressed to the states, conducted negotiations with foreign ambassadors and ministers, and took charge of the revenues of the province, of its rights and privileges, and whatever else pertained to its welfare. He was a perpetual member of the states-general of the United Netherlands, and thus, as first magistrate of the first of the united provinces, he acquired immense influence over all Holland, and may be considered premier of the Dutch parliament. The grand pensionary held his office for five years, but was in most cases re-elected. The office was abolished in 1795, after the conquest of Holland by the French revolutionists.

GRAND-PIERRE, JEAN HENRI, D.D., 1799-1874; b. Switzerland, educated in Neufchatel and Tübingen; became pastor at Bâle and was an intimate friend of Vinet. In 1827 he went to Paris and was president and professor of languages in the theological seminary, and was soon recognized as one of the most eloquent of pulpit orators. His last 20 years were passed as pastor of l'Oratoire, the greatest of Protestant churches in the French capital. After Monod's death he was leader of the orthodox branch of the

Reformed church. Louis Philippe granted him letters of naturalization, and Louis Napoleon made him a member of the legion of honor. In 1838 he was granted the degree of doctor of divinity by the college of New Jersey. He visited the United States twice, and in 1850 published *A Glance at America*. With his family he endured the siege of Paris (in the Franco-German war) and the horrors of the commune. Among his works are *Christian Doctrine; Christian Life; Unity and Variety; Sorrow and Consolation; Guide to Faith; Essay on the Pentateuch; Souvenirs of an Old Pastor*, etc.

GRAND PRÉ, a village in Nova Scotia, in Kings co., on the basin of Minas, reached by the Windsor and Annapolis railroad, 15 m. from Windsor; pop. about 600. It is notable chiefly as the central scene in Longfellow's pastoral poem *Evangeline*.

GRAND RAPIDS, a prosperous manufacturing city, in the state of Michigan, U. S., is situated in a pleasant and healthy district on both banks of the Grand river, about 33 m. from lake Michigan, and 60 m. n.w. of Lansing. The river is here about 900 ft. wide, and descends 18 ft. in the course of 1 m., producing abundant water-power. The town is handsomely built, commands a fine view, and is one of the most important trading and manufacturing cities in the state. The vicinity is rich in salt and gypsum, and in limestone, pine-lumber, and other building materials. Pop. '70, 18,157. The city was first settled in 1833, and incorporated in 1850.

GRAND RAPIDS (*ante*), a city and seat of justice in Kent co., Mich., on Grand river at the junction of seven railways, 158 m. w. of Detroit; pop. '74, 25,989. The river and canals on either shore furnish abundant water power, and there are many large manufactories of lumber, furniture, cooper's work, wooden ware, farming tools, iron, leather, flour, machinery, bricks, cement, plaster, chemicals, beer, etc. The plaster is got from gypsum deposits in the neighborhood. The city is tolerably well built, and is the center of an important trade. It has a fine court-house and post-office, churches, and public schools.

GRAND RIVER, a river of North America, rises and flows throughout its entire course, within the state of Michigan, and falls into the lake of that name at the town of Grand Haven (q.v.). Its source is in the s.e. of the state, in two branches which unite near the town of Jackson. Grand river is navigable for large steamers to the rapids, which are 40 m. from the mouth of the river, and for smaller boats for 50 m. further; its whole course is 270 miles.

GRAND RIVER, a tributary of the Colorado, rising in Middle Park, s. Dakotah, passes into Utah in a s.w. direction crossing the s.e. section of the territory, then into Arizona and after a course of about 390 m. unites with the San Juan to form the Colorado of the w., so famous for its wonderful cañons. There are some large cañons on Grand river also.

GRAND SERGEANTY (*magna serjeantia*, or *magnum servitium*, great service), was the most honorable of the ancient feudal tenures. According to Lyttleton, tenure by grand sergeanty is where a man holds his lands or tenements of our sovereign lord the king by such services as he ought to do in his proper person to the king, as to carry the banner of the king, or his lance, or to lead his army, or to be his marshal, or to carry his sword before him at his coronation, or his carver, or his butler, or to be one of his chamberlains of the receipt of his exchequer, or to do other like services. This tenure must have been held of the king. Where lands were held of a subject, on condition of performance of services identical with those which were rendered to the king, the tenure was not grand sergeanty, but knight's service. Thus, lands on the Scottish border held of the king by cornage—i.e., on condition of winding a horn to give notice when the Scots had crossed the border—were held in grand sergeanty; but lands held of a subject for the same service were held in knight's service. Tenants holding by grand sergeanty were free from escuage, which usually appertained to knight's service, and in general could only be called upon to perform their services *infra quatuor maria*, within the kingdom. The services in grand sergeanty were to be performed by the tenant in person, where he was able to do so. The office of attendance on the sovereign's person was esteemed so honorable, that no one below the dignity of a knight could perform it. Hence, where lands held by grand sergeanty were in the possession of a citizen, he was permitted to perform his service by deputy. This tenure by grand sergeanty was by 12 Charles II. c. 24, in common with other military tenures, reduced to common socage (q v.); except so far as regards the honorary services, which continue to be observed to this day. Thus, the duke of Wellington holds of the crown his estate of Strathfieldsaye on condition of presenting to the sovereign a flag bearing the national colors on each succeeding anniversary of the battle of Waterloo. The manor of Woodstock, with the demesne, in which is situated Blenheim park, is held by the duke of Marlborough by grand sergeanty, on condition of presenting to the queen and her heirs, at the castle of Windsor, a standard of France, on Aug. 13, yearly, being the anniversary of the day on which the battle of Hochstädt was fought near the village of Blenheim, on the banks of the Danube. The tenure of grand sergeantry was observed throughout the continent of Europe. "The freeborn Franks," says Mr. Hallam, *Middle Ages*, "saw nothing menial in the titles of cupbearer, steward, marshal, or master of the horse, which are still borne by the noblest families in every country in Europe, and by sove-

reign princes in the empire. The count of Anjou, under Louis VI., claimed the office of great seneschel of France—i.e., to carry dishes to the king's table on state-days. Thus, the feudal notions of grand sergeanty prepared the way for the restoration of royal supremacy, as the military tenures had impaired it."

In Scotland, grand sergeanty was not known as a separate tenure—that is to say, lands held on condition of honorary services rendered to the sovereign were not attended with any privileges other than those attaching to lands held in a similar manner of a subject superior. In that country a tenure by honorary service was known as a BLANCH HOLDING.

GRAND TRAVERSE, a co. on Grand Traverse bay in n.w. Michigan, 500 sq.m.; pop. '74, 5,349. The surface embraces a number of lakes and large areas of timber, among which are sugar-maple and white pine. The main article of export is lumber. Co. seat, Traverse city. Grand Traverse bay, is an offshoot of lake Michigan extending s. 30 m. by 12 m. wide. Grand Traverse river, rises in Kalamazoo co., and after a short course w. and n. empties into the bay of the same name.

GRANDVILLE, JEAN IGNACE ISIDORE GÉRARD, a French artist and caricaturist, was b. at Nancy, Sept. 3, 1803. In the year 1828 he published the first of a series of humorous sketches, entitled *Les Métamorphoses du Jour*, which were highly thought of; and soon afterwards another series, entitled *Les Animaux Parlants*. After the July revolution Grandville, with Decamps and Daumier, became the moving spirit of the "caricatures," perfect collections of which are now in great request. His *Convoi de la Liberté*, his *Basse Cour, Mat de Cocagne*, etc., as pictures of the politics and manners of the times, are of great and lasting value. When the law of Sept. put an end to political caricature, Grandville used his pencil to satirize the less important follies and vices of mankind. He also contributed illustrations to new and splendid editions of the *Fables* of Lafontaine and Florian, the *Adventures of Robinson Crusoe, Gulliver's Travels*, Abel Hugo's *Vie de Napoleon*, Raybaud's *Jérôme Paturot*, etc. Grandville is remarkable for depth and delicacy of observation and criticism, for his ingenious turn of thought, and accuracy in portraiture. His drawing is correct, his anatomy accurate, his foreshortening carefully studied; the whole is occasionally hard and cold, the idea complicated, but always united with rare delicacy of allusion and affluence of symbolical details. Grandville died in 1847.

GRANE, GRAN, or QUADE, a t. and seaport of Arabia, is situated on a bay of the same name at the north-western extremity of the gulf of Persia, in lat. 29° 26' n., long. about 48° east. Its trade is of some importance. Pop. estimated at about 8,000.

GRANGE, a word which primarily means a granary or storehouse for grain, but which has been broadly used as signifying an estate with all the buildings thereon; used in the United States since 1867, as the familiar name of the state and subordinate organizations of the "patrons of husbandry," a national association of agriculturists, of which Mr. O. H. Kelley, a native of Boston, is the reputed founder. The society originated in the depressed condition of agriculture following the war of the rebellion, and was especially designed to redress the grievances of farmers at the west on account of the alleged injustice of the railroad companies in their charges for carrying agricultural freight, and on account of the exorbitant prices paid to middlemen for handling such freight and for supplying agricultural implements and stores. The plan of the organization, which is somewhat like that of the odd-fellows, was formed by Mr. Kelley and Mr. William Saunders, who were connected with the department of agriculture in Washington, and was designed to bring the farmers of the country into active co-operation for mutual protection. The plan embraced a common ritual, with secret ceremonies of initiation, to be observed by the local associations, which are subordinate to the national body. Each grange elects its own officers, women being admitted to membership equally with men, but no one of either sex being eligible unless interested in agricultural pursuits. The national and state granges meet annually, the local ones monthly or oftener. The order has its greatest strength in the north-western states. In 1875 the total number of granges was estimated at 30,000, with a membership of nearly 2,500,000. In 1874 the national grangers issued a manifesto declaring the objects of the order to be "to develop a better and higher manhood and womanhood among ourselves; to enhance the comforts and attractions of our homes; to buy less and produce more, in order to make our farms self-sustaining; to discountenance the credit system, the mortgage system, the fashion system, and every other system tending to prodigality and bankruptcy; to secure harmony, good-will, and vital brotherhood among ourselves, and to make our order perpetual." The order is social and economic, and neither political nor sectarian. Through the influence of its members, laws were passed in Illinois and Wisconsin putting railroad companies under sharp restrictions as to their charges for carrying agricultural products; but some of these laws were declared to be unconstitutional by the courts, and the order has accomplished far more by moral and social influence than by legislation. The benefits conferred by it upon the agricultural community are believed to be very great. The system of co-operation which it has fostered has assisted not a few farmers in their efforts to get out of debt, and developed a spirit of enterprise and co-operation which is of inestimable value. But, notwithstanding this, the order is understood to have declined in the last few years. Whether

this is because it is somewhat overweighted with its own machinery of organization, or because other objects have, for the time being, absorbed the attention of its members, is not here affirmed. Certainly there is no diminution of the popular interest in agriculture, and it is believed that farmers as a class are as keenly alive to their interests now as at any previous time.

GRANGER, FRANCIS, 1792–1868; son of Gideon, b. Connecticut. He removed in early life to western New York and practiced law. He was a member of the assembly and a prominent leader in the anti-masonic movement; became a leader in the whig party and a member of congress, and in 1841 was appointed postmaster-general. His last appearance in political life was as one of the leaders of the small section known as "silver gray" whigs, who opposed the drift of the party toward active opposition to slavery.

GRANGER, GIDEON, 1767–1822; b. Conn.; graduated at Yale, and admitted to the bar in 1788. He was for several years a member of the legislature, and conspicuous in efforts to promote education by establishing a school fund. In 1801 he was made postmaster-general, holding the office until 1814. In New York he was state senator, and a warm supporter of De Witt Clinton's plans for internal improvement.

GRANGER, GORDON, 1821–76; b. New York; a graduate of West Point; was transferred to the mounted rifles in 1846; was in the siege of Vera Cruz, and the battles of Cerro Gordo, Contreras, and the capture of Mexico. In 1861 he was a capt. of cavalry. In the war of the rebellion he served with distinction in several battles, and in 1862 became maj.gen. of volunteers. He was in the battle of Chickamauga, at Missionary ridge, and the siege of fort Morgan and capture of Mobile; subsequently he was department commander in Texas and Kentucky. In 1866 he was made col. of infantry.

GRANGER, ROBERT S., b. Ohio, 1816; graduate of West Point; served in the Florida Indian war; was tutor at the military academy; for many years on the frontier; in the war of the rebellion, col. of Kentucky volunteers (union), and participated in many skirmishes and battles. In 1871 he was appointed col. of infantry, and two years afterwards was placed upon the retired list.

GRANI'CUS, the ancient name of a small river in the n.w. of Asia Minor, flowing from the northern side of mount Ida to the Propontis, and now known as the Kodsha-su. The Granicus is celebrated as the scene of the first victory gained by Alexander the great over the Persians after he crossed the Hellespont, 334 B.C.

GRANIER DE CASSAGNAC, BERNARD ADOLPHE, a name well known among Parisian journalists, and not unknown in the Palais de Justice, was born at Averon-Bergelle (dep. Gers), in 1808. He was educated at the college of Toulouse, and contributed for a short time to the southern press, but soon quitted the provinces for Paris, where Victor Hugo introduced him to the *Journal des Débats*, and *Revue de Paris*. Here his vehement style did not give satisfaction, and he was engaged by M. Girardin to write literary criticisms for *La Presse*. In 1840 he sailed for the Antilles, in hopes of political advancement, ingratiated himself with the planters, although he narrowly escaped being murdered by the blacks, married a Creole lady, Mademoiselle Beauvallon, and returned to Paris as deputy for Guadeloupe. Not being able to arrange a satisfactory engagement with *La Presse*, he founded the *Globe*, ultra-Orleanist, and violent to such a degree that the opposition journals agreed to ignore it (*la conspiration du silence*, as it was called). The *Globe* failed; and in 1845 Granier de Cassagnac started *L'Epoque*, also violent, and also a failure. It was merged in the *Presse*, not, however, before its editor had been openly accused in the chamber of deputies of selling his influence with the government. Shortly before the revolution, he was employed by M. Guizot to set up a ministerial paper at Rome. In 1848 he returned to France, and after a while reappeared in Paris, as an ardent supporter of the prince president, and a bitter foe to his old patrons, the house of Orleans. He edited the *Pouvoir* (1850), and wrote for the *Constitutionnel* with an excess of zeal and a pretense of exclusive information which led to an *avertissement*. In 1852 he was elected as the government candidate for Mirande (Gers), for which he was re-elected in 1857 and 1863. In the chamber, he spoke in favor of the army dotation bill, advocated direct taxation on all descriptions of funded property, additional protection for the interests of literature, and the formation of a local railway in his department. In 1857 he was made grand officer, and in 1865 commander of the legion of honor. In 1867 he founded *Le Réveil*, a weekly religious organ, which died the next year. He afterwards became principal editor of the semi-official *Pays*, and in 1863 was manager of the *Nation*. In 1870 on the fall of the empire, he retired to Brussels; in 1876 he was elected a member of the national assembly. The appearance of Granier de Cassagnac before the courts of justice have been very numerous. In 1842 he was tried for a duel with M. Lacrosse, of whose father he had written disrespectfully, and whom he lamed for life. In 1845 he prosecuted M. Hilbey for libel in his pamphlet on the *Venality of the Press*. In 1847 he was mixed up in the duel in which his brother-in-law, Beauvallon, killed Dujarrier of *La Presse*, and about which strange things were said. He was also sued by Delasalle for a debt which he declared he had paid. M. Delasalle gained his cause. In 1855 his publisher pro-

ceeded against him for non-delivery of a MS. on the eastern war. The duel between Paul de Cassagnac of the *Pays* and a writer in the *Soleil* (in which Granier de Cassagnac seconded his son), and the unseemly quarrel between the Cassagnacs and M. Vermoul of the *Courrier Français*, were matters of great notoriety. His most important works are: *A Voyage to the Antilles* (1844); *The Queen of the Prairies*, a romance (1845); *The Causes of the French Revolution of* 1789 (1850); *The History of the Directory*, a reprint from the *Constitutionnel* (1851–56); *The Fall of Louis Phillippe* (1857); *The Girondins and the Massacres of September* (1860), etc. All his writings are remarkable for vigor of style, but the thorough-going partisanship of the author greatly impairs their historical value.

GRANIER DE CASSAGNAC, Paul, b. 1840 or '41. He began when quite young to write for newspapers, and soon became noted for the fierceness of his personal attacks on his contemporaries and the duels to which such attacks often led. In 1866, under the patronage of his father, he joined the editorial staff of *Le Pays*, an influential journal of Paris, and not long after became the principal editor. From that period to the present he has pursued a course so aggressive as to be in an almost continuous series of quarrels, particularly with editors and writers of the anti-Bonapartist side. One of his several encounters was with Gustave Flourens in 1869. In 1868 Louis Napoleon gave Cassagnac the decoration of the legion of honor, and the next year he became member of the general council for Gers. In the German war he served as a volunteer in the zouaves, was captured at Sedan, and kept a prisoner in Silesia for eight months. When free he resided for a time in Vienna, then went to Gers and established *L'Appel au Peuple*, a violent political journal. In 1872 he resumed his chair as editor of *Le Pays*, but within a brief period he was again in a duel (with M. Lockroy), for which he got a week's imprisonment and a fine of 100 francs. In 1873 he fought M. Ranc, a journalist, when Ranc was disabled and Cassagnac was slightly wounded. In 1874 he was tried for printing articles calculated to disturb the peace, on which occasion he conducted his defense in person and was acquitted, an event looked upon by the imperialists as a signal triumph. In 1874 he violently criticised gen. Wimpffen for the surrender of Sedan. The officer prosecuted for libel, but the editor was acquitted. In 1876 and 1877 he was returned to the national assembly for Gers.

GRANITE, a well known igneous rock, composed of the three minerals, quartz, feldspar, and mica, united in a confused crystallization; that is, without a regular arrangement of the crystals. The feldspar is the most abundant ingredient, and the proportion of quartz is greater than that of mica. The name has been given to it on account of its granular structure.

Granite differs from greenstone and the later igneous rocks, in the large quantity of quartz that enters into its composition. In the trappean and other igneous rocks, the silica or silicic acid is only sufficient for union with the bases to form feldspar and horablende, the constituents of these rocks, none remained free to crystallize as pure quartz; while in granite, so great is the excess of silex, that in its pure state, as quartz, it forms a considerable bulk of the rock. Granite is always a compact rock, it never passes into or alternates with tuffs or breccias. This peculiarity, associated with the crystalliae structure of the rock, and the absence of cellular cavities, such as are produced in trappean and volcanic rocks by the expansion of the contained gases, have led to the belief that granite has been formed at considerable depths in the earth, and has crystallized slowly under great pressure either from superimposed strata or deep seas. On this account the granitic rocks have been called "Plutonic rocks;" and Lyell has applied to them the term "hypogene," from *upo*, under, and *ginomai*, to be born. It was formerly supposed that all granitic rocks were formed before the deposition of any of the sedimentary strata, and hence they are named "Primitive rocks." But it having been found that granite is associated with formations of various ages, and that even since the beginning of the tertiary epoch its intrusion among the eocene strata of central Europe has raised the Alps more than 10,000 ft. above the level of the sea, this name has been entirely dropped. Although granite is not absent from the secondary or tertiary strata, it is more frequently associated with the palæozoic formations; indeed, it appears to be the fundamental rock of the earth's crust. Wherever we reach the base of the stratified rocks, we find them resting upon granite; and whatever the age of the strata thus lying on this igneous rock, we have no reason to suppose that below the granite there occur beds of older date, for, although granite penetrates the stratified rocks, it has not been noticed to spread over them like greenstone, so that wherever it presents itself in a large mass, it is believed that no other rock is beneath it. Some granites, however, occur interstratified with undoubted sedimentary rocks, and it is argued that, as the transition from these sedimentary rocks to the crystalline granite can be traced by gradual stages through mica schist and gneiss, the granite is only the final stage of these metamorphic changes. Many of the granites of Scotland are accordingly believed to be older palæozoic sediments greatly altered. It is not maintained that all granites have such an origin; but no lithological character has yet been observed whereby the igneous granite can be distinguished from that produced by metamorphic action.

Large extents of the earth's surface are covered with granites; occasionally, it is the superficial rock in flat undulating plains, but it most frequently makes its appearance

in mountainous regions. It seems probable that sometimes igneous granite has been raised from below as a solid indurated rock; it has, however, generally been in a fluid condition, as is evidenced by the number of veins which are protruded from it into the adjacent rocks.

The varieties of granite depend upon the number and quantity of its mineral constituents, and upon the state of aggregation of these materials. Ordinary granite is composed of feldspar, mica, and quartz. The feldspar may be either the flesh-colored potash variety, orthoclase, or the pure white soda variety, albite, or both potash and soda may enter into its composition. The mica varies in color from a pure silvery white, through the more common brown, into black. The quartz is generally white, seldom dark-gray or brown. The predominance of one or other of the ingredients, or of a particular variety, gives the peculiar color to the mass, which is generally either red, gray, or white. The red is produced from the predominance of orthoclase; the white, of albite; and the intervening gray from the mica, or sometimes from the quartz. The feldspar forms generally a half, and sometimes even more of the bulk of the rock; the mica in one variety, and the quartz in another, are so minute as to be scarcely visible. Sometimes the feldspar separates into large and distinct crystals forming a porphyritic granite. The substitution of hornblende for mica produces that variety called syenite (q.v.); and if talc takes the place of the mica, the rock is called protogene (q.v.). When the ingredients exist in a compact and finely granular condition, the compound is known as eurite. Sometimes, especially in veins, feldspar and dark quartz are arranged so as to produce an imperfect laminar structure, which, when broken at right angles to the laminæ, presents numerous broken and angular lines that have a faint resemblance to Hebrew characters, whence it is called graphic granite.

Granite is largely used as a building material in bridges and engineering-works, and also in public buildings and dwellings. The difficulty of working it makes it expensive, but this is counterbalanced by its great durability. It cannot be cut, like the majority of building-stones, with saws, but is first worked with large hammers, and then with pointed chisels. The success with which the Egyptians operated upon this refractory stone is very extraordinary. They worked and polished it in a way which we cannot excel, if, indeed, we can come up to it, with all the appliances of modern science; and not content with polishing, they covered some of the blocks with the most delicate and sharply cut hieroglyphics!

The granites best known for ornamental purposes are the gray Aberdeen granite and the reddish colored Peterhead granite. Of this last-mentioned variety, handsome polished columns for public halls have been constructed.

The soil produced by the weathering of granitic rocks should be fertile, as their chemical composition contains the necessary elements. The great hardness of the rock, and its resistance to atmospheric influences, prevents a soil of any thickness being formed; and even where it exists, at least in our temperate regions, it is generally so high and exposed, that it is unfavorable to vegetation; in warmer climates, such soils are frequently very fertile.

GRANMICHE'LE, a t. of Sicily, in the province of Catania, and 30 m. s.w. from Catania, on a mountain ridge, at an elevation of 1768 ft. above the sea. Beautiful marbles are produced in the neighborhood. The town was founded in the end of the 17th c., by the Branciforte family, and peopled with the inhabitants of the neighboring town of Occhialà, which was destroyed by the earthquake of 1693. Pop. 10,058.

GRAN SASSO D'ITALIA ("Great Rock of Italy"), also called MONTE CORNO, from the resemblance to a horn which it presents on the e., is the highest summit of the Apennines, having an elevation of 10,206 ft. It is situated on the borders of the Abruzzi, between Teramo and Aquila. It owes its name partly to its height, and partly to its being formed of a single mass of calcareous earth from its middle to its summit. It is seen to great advantage from the side of Teramo, where it is broken into tremendous precipices. The summit is covered with perpetual snow. Wolves, bears, and chamois abound on the mountain—the last of these animals being found in no other part of the Apennines. The general character of the scenery is more Alpine than Apennine, and in wild grandeur and variety it is not surpassed by any landscape in Italy. To the painter, geologist, and botanist it affords a rich field for their respective pursuits. See *Itinerary* of F. Caldane.

GRANT, a co. in s. central Arkansas on Saline river; 650 sq.m.; pop. '70, 3,943—389 colored. The surface is hilly, and to a large extent covered by forests. The chief productions are cotton, corn, hay, and pork. Co. seat, Sheridan.

GRANT, a co. in e. Dakotah, on the Minnesota border, s.w. of Big Stone lake. It is unsettled, and almost destitute of forests.

GRANT, a co. in n.e. Indiana on the Mississinewa river, crossed by the Pittsburgh, Cincinnati, and St. Louis, and the Cincinnati, Wabash, and Michigan railroads; 420 sq.m.; pop. '70, 18,487. It is mostly level and fertile; about a third being woodland. Corn, wheat, oats, and pork are the main products. Co. seat, Marion.

GRANT, a co. in s.w. Kansas, on the Cimarron river and its branches; 576 sq.m.; formed after the census of 1870. It consists almost entirely of prairies.

GRANT, a co. in n. Kentucky, drained by Eagle creek and crossed by the Cincinnati Southern railroad; 200 sq.m.; pop. '70, 9,529—509 colored. Surface undulating and soil fertile, producing corn, wheat, hay, etc. Co. seat, Williamstown.

GRANT, a parish in central Lousiana, on Red river and Saline bayou; 500 sq.m.; pop. '70, 5,417—2,414 colored. The surface is mostly level, and the soil fertile. The main productions are cotton and corn. Seat of justice, Colfax.

GRANT, a co. in w. Minnesota on the Mustinka and Pomme de Terre rivers, crossed by the St. Paul and Pacific railroad; 625 sq.m.; pop. '75, 1119. The surface is undulating prairie, with many small lakes. The soil is fertile and favorable for wheat. Co. seat, Elbow Lake.

GRANT, a co. in the extreme s.w. of New Mexico between the Rio Grande and Arizona, drained by the Gila; about 10,000 sq.m.; pop. '70, 1143. The surface is rough and in some parts mountainous, with fertile valleys. Wheat, corn, and grass are the chief products. Water and timber are scarce on the high lands. The precious metals and copper are found. Co. seat, Pinos Altos.

GRANT, a co. in e. Oregon, on the John Day river; 21,000 sq.m.; pop. '70, 2,251. The surface is rough, the Blue mountains occupying a considerable area. Cattle, wheat, and lumber are the chief products. Gold has been found in large quanties. Co. seat, Cañon City.

GRANT, a co. in n.e. West Virginia, drained by affluents of the Potomac and traversed by branches of the Alleghany range; 460 sq.m.; pop. '70, 4,467,—331 being colored. Some portions are fertile, producing wheat, corn, and cattle. Co. seat, Maysville.

GRANT, a co. in s.w. Wisconsin between the Mississippi and Wisconsin rivers and drained by the Platte and Grand; 1100 sq.m.; pop. '75, 39,086. The surface is varied and the soil very fertile, producing corn, wheat, oats, etc. Co. seat, Lancaster.

GRANT, in English law, the conveyance of real property by deed. Originally, the term grant was confined to the conveyance of incorporeal hereditaments and estates in reversion; according to the maxim that incorporeal property lay in grant, and corporeal property in livery, it being impossible to give actual sasine of that which had no tangible existence, or was not in the possession of the grantor. In order to complete the conveyance of a reversion or remainder by grant, it was necessary that the tenant of the particular estate should acknowledge the grantee by attornment. The necessity for attornment was abolished 4 and 5 Anne, c. 16, s. 9. By 8 and 9 Vict. c. 106, it is enacted that estates, corporeal as well as incorporeal, may be conveyed by grant.

GRANT, Mrs., of Carron, author of the popular song of *Roy's Wife of Aldivalloch*, was born near Aberlour, in Banffshire, about the year 1745. She was twice married—first to her cousin, Mr. Grant of Carron, near Elchies, on the river Spey; and secondly, to Dr. Murray, a physician in Bath. She died at Bath about 1814.

GRANT, Mrs. Anne, a miscellaneous writer, whose works were among the first to draw public attention to the romantic scenery and peculiar manners of the Scottish highlands, was born in Glasgow in 1755. She was the daughter of a British officer named M'Vicar, who became barrack-master of fort Augustus. She married the rev. James Grant, chaplain of the fort, and subsequently minister of Laggan. Left a widow in destitute circumstances, Mrs. Grant published by subscription a volume of *Poems* (1803), which were well received; in 1806, *Letters from the Mountains*—a highly popular work; in 1808, *Memoirs of an American Lady;* in 1811, *Essays on the Superstitions of the Highlanders of Scotland;* etc. In 1825 Mrs. Grant received from government a pension of £100 a year. She died in 1838.

GRANT, Charles, Lord Glenelg, was born in India, at Kidderpore, presidency of Bengal, in 1779. He was of a highland family, the Grants of Shewglie. His grandfather (who was slain at the battle of Culloden) married one of the Macbeans of Kinchyle; and his father was born in Aldourie House, and the banks of Loch Ness, also the birthplace of sir James Mackintosh. The father of lord Glenelg (also Charles Grant) went early to India, became one of the most distinguished directors of the East India company, represented for many years the county of Inverness in parliament, and was, along with Wilberforce, Thornton, Zachary, Macaulay, and others, a leading member of the Clapham sect, described by sir James Stephen in his *Ecclesiastical Essays*. He died in 1823, aged 77. Charles, his eldest son, was carefully educated, and distinguished himself at Magdalene college, Cambridge, where he took his degree of M.A. in 1804. In 1805 he published a poem on the *Restoration of Learning in the East*, which had carried the university prize awarded by Dr. Claudius Buchanan. He was called to the bar in 1807, but never practiced. In 1811 he was elected M.P. for the Inverness district of burghs; and afterwards succeeded his father in the county representation, he continued in the house of commons for a period of 25 years, at the expiry of which he was raised to the peerage by letters-patent bearing date May 8, 1835. Grant held for five years the office of a lord of the treasury; and in 1819 succeeded to the important appointment of secretary for Ireland, which he continued to fill for about two years. He was the first secretary for Ireland that sought to carry out conciliatory measures. He

endeavored to suppress the orange demonstrations, to secure impartial administration of justice, and to devise a system of national education adapted for Catholics as well as Protestants. Nearly all that has since been done was proposed by this enlightened statesman, and the future historians of Ireland will point to him as one of the genuine though ill-requited benefactors of that country. From 1823 to 1827 Grant was vice-president of the board of trade; from 1830 to 1834, president of the board of control; and from Nov. 1834 to Feb. 1839, secretary of state for the colonies. After this period, Grant withdrew in a great measure from public affairs, but supported the liberal party by his vote. He died at Cannes, in France, in 1866. Lord Brougham pronounced Grant to be "the purest statesman he had ever known." He was an eloquent speaker, though partly from diffidence, and partly from indolence, he spoke but seldom. Some of his despatches as colonial secretary, on the rights of the natives in the colonies, on repressing idolatry, and abolishing slavery throughout the British possessions in south Africa, are models of elevated and just thought, and of fine impressive English.

GRANT, FRANCIS, Lord CULLEN, a Scottish judge and political writer, was the son of Archibald Grant of Belinton, a cadet of the family of Grant of Grant, chief of the clan of that name. He was born about the year 1660, was educated first at Aberdeen, and afterwards at Leyden, adopted the profession of the law, and distinguished himself by his loyal zeal for the successive governments of William III., queen Anne, and George I. He wrote in favor of the union, on the observance of the Sabbath, on the law of patronage in the church, essays on law, religion and education, and reflections on the rebellion of 1715. For seventeen years he filled the position of a judge with great ability and integrity. He died at Edinburgh in 1726.

GRANT, Sir FRANCIS, fourth son of Francis Grant of Kilgraston in Perthshire, was born in Edinburgh, 1803. He received his education at Harrow and at the university of Edinburgh, and was, it is said, originally intended for the Scottish bar, but soon abandoned all thoughts of legal honors, to follow his natural genius for painting. He studied drawing under Somerville, a local artist of some repute, and was enabled, by the kindness of lord Elgin, to form his taste in that nobleman's gallery. A noble portrait by Valasquez is said to have exercised an especial influence over the young painter's future art career. His first picture was exhibited in 1834, when he at once took rank among the best portrait painters of the day, and was regarded as a worthy successor of the courtly Lawrence. His most famous works are those in which he has combined the likenesses of distinguished characters with scenes of English sports. The "Meet of H.M. Stag-hounds," painted in 1837 for lord Chesterfield, and containing no less than 46 portraits; the "Melton Hunt," executed for the duke of Wellington; and the "Cottesmore," for sir R. Sutton, are the best known in this class. Among his other paintings, may be mentioned the equestrian portraits of the queen and prince Consort for Christ's hospital; the picture of the beautiful marchioness of Waterford; and those of lords Palmerston, Russell, Gough, Macaulay, Hardinge, etc. In 1842 Mr. Grant was elected associate, and in 1851, academician. In 1855 he received one of the three gold medals awarded to British artists at the Paris exhibition (for his "Meet of H.M. Stag-hounds"), and was also elected member of the Belgian academy. In 1866 the president's chair in the royal academy having become vacant, through the death of sir C. Eastlake, and neither sir E. Landseer nor Maclise being desirous of the post, Mr. Grant was elected in Feb. by 23 votes out of 29, and soon after received, according to ancient precedent, the honor of knighthood. In 1870 he received the degree of D.C.L. from Oxford. Sir Francis was twice married, his first wife being a Miss Farquharson of Invercauld; his second, a daughter of Mr. and Lady Elizabeth Norman, by whom he had a numerous family. He died Oct., 1878.

GRANT, JAMES, of Corrimony, in Inverness-shire, born in 1743, died in 1835, was author of *Essays on the Origin of Society*, 1785, and *Thoughts on the Origin and Descent of the Gael*, 1814. The latter is a learned and ingenious work, imbued with Celtic feeling and enthusiasm.

GRANT, JAMES, b. Edinburgh 1822. While a boy he was for several years with the British army in Newfoundland, was made an ensign, and, in 1840, had charge of the military depot at Chatham. He left the service to devote his attention to literature, and the study of Scotch antiquities. His first work (1846) was *The Romance of War, or Highlanders in Spain.* This was followed in rapid succession by more than 40 different works, of which the more important are *Adventures of an Aide de Camp; Kirkcaldy of Grange; Memoirs of the Marquis of Montrose; Walter Fenton, or the Scottish Cavalier; Bothwell, or the Days of Mary Queen of Scots.* Many of his books are on martial themes but among them are a number of novels. A considerable number have been reprinted in the United States. In 1875 Grant left the Protestant church and became a Roman Catholic.

GRANT, JAMES AUGUSTUS. b. Scotland 1827; educated at Aberdeen; served in the English army in India, and was with gen. Havelock at Lucknow. In 1863 he was with Speke in exploring the sources of the Nile. In the Abyssinian expedition he was at the head of the intelligence department under lord Napier. He has published *A Walk Across Africa; Botany of the Speke and Grant Expedition,* and various papers in the scientific journals.

GRANT, Sir JAMES HOPE, b. Scotland 1808; served in the British army in the first Chinese war, and through the Punjab campaign in 1848–9. In 1858 he was made maj.gen. He was distinguished at the seige of Delhi, and the relief of Lucknow, and also in movements at Cawnpore. He directed and brought to a successful close the British campaign in China which terminated with the capture of Peking in 1860. In 1861 he was lieut.gen. and commander-in-chief at Madras. He has published *Incidents in the Sepoy War*.

GRANT, PATRICK, Lord ELCHIES, a Scottish judge, was b. in 1690. He collected the decisions of the court of session from 1733 to 1757, and wrote annotations on lord Stair's institutes. He was celebrated as an acute and learned lawyer. He died in 1763. His son, JOHN GRANT, became one of the Barons of Exchequer in Scotland.

GRANT, Sir ROBERT, governor of Bombay, brother of Lord Glenelg, was b. in 1785. In 1801 the brothers took their degree of B.A. together in Cambridge, Charles being third, and Robert fourth wrangler, with the additional distinction of Charles being first, and Robert second medallist. The latter was called to the bar at Lincoln's Inn in 1807, sat for some time in the house of commons as member for Inverness, and afterwards for Norwich and for Finsbury. In 1834 he was knighted, and appointed governor of Bombay. He died at Dapoorie in 1838. He was author of two treatises on Indian affairs, and of several hymns and short poetical pieces, greatly admired, which was collected and published by lord Glenelg in 1839.

GRANT, ULYSSES SIMPSON, eighteenth president of the United States, was b. at Point Pleasant, Clermont co., Ohio, April 27, 1822; graduated at the military academy of West Point in 1843, and served under gen. Taylor in the war with Mexico, 1846, up to the capture of Monterey. His regiment was then transferred to the expedition under gen. Scott, and he took part in every action from Vera Cruz to Mexico, and was brevetted first-lieut. and capt. for meritorious conduct at Molino del Rey and Chapultapec. In 1852 he served in Oregon; but in 1854 resigned his commission, and settled at St. Louis, Missouri, whence, in 1859, he moved to Galena, Illinois, and engaged in the leather trade. At the beginning of the war of secession in 1861, he volunteered his services, and was appointed col. of an Illinois regiment. In August he was appointed brig.gen., commanding the important post of Cairo, occupied Paducah, and led an expedition on the Mississippi. In Feb., 1862, he distinguished himself in the capture of fort Donelson, on the Tennessee River, and was made maj.gen. On April 6, following, after a preliminary defeat, he won a great battle over the confederates at Pittsburg Landing, or Shiloh. Succeeding gen. Halleck in the w., he commanded the land-forces which, in conjunction with the navy, reduced Vicksburg, July 4, 1863, soon followed by the fall of fort Hudson, and the opening of the Mississippi. He then took command of the army of Tennessee, and defeated gen. Bragg at Chickamauga, in September of the same year; and was, in 1864, appointed lieut.gen. and commander-in-chief, and personally directed the operations of the great final struggle in Virginia, in which the northern forces, though often repulsed with heavy losses, finally compelled the evacuation of Richmond, April 2, 1865, followed on the 9th by the surrender of the confederate army under gen. Lee, and soon after of the entire confederate forces. Congress, in recognition of his eminent services, passed an act reviving the grade of "General of the Army of the United States," to which Grant was immediately appointed. In 1868 he was elected, on the "republican" platform, president of the United States; and having in 1872, been re-elected over Horace Greeley, he retired in 1877, after his second term of office. In the latter year Grant visited Europe, everywhere receiving a hearty welcome, and completed a tour round the world in 1879. Simple, reticent, earnest, and persevering in his character, he owed his military success not so much to strategy as to superior numbers and resources, and hard fighting, in which even a series of victories left his enemy less able to resist. During Grant's presidency a great reduction was made upon the national debt incurred during the civil war. The military government of the southern states in those years cannot be regarded as successful. The most important event connected with relations to foreign states was the settlement of the Alabama question by the "joint high commission" in 1871.

GRANT, ULYSSES SIMPSON (*ante*), the most famous of American soldiers, and president of the United States from Mar. 4, 1869, to Mar. 4, 1877, won his great reputation in the war of secession, into which he entered as the col. of an Illinois regiment, and out of which he came as the successful leader of the national armies, and holding a place in the hearts of his countrymen hardly less exalted than that so long held by Washington. He is of Scotch ancestry, from which he no doubt inherited the qualities that fitted him to conquer the most formidable rebellion of either ancient or modern times. Educated at West Point, he did good service as a subordinate officer in the war with Mexico, resigning a few years afterwards and entering upon an inconspicuous career, first as a farmer in the neighborhood of St. Louis, and afterwards as a leather merchant in Galena. In the latter position he was found when the war of the secession began in 1861. He promptly offered his services to the government without stipulation or reserve, and of all those who knew him there was probably not one who had the slightest suspicion that he would develop a great capacity for military leadership. It may even be doubted that he himself had any anticipations of the career so soon to open

before him. If his breast heaved with great hopes and ambitions, the reticent man kept them strictly to himself and went quietly to the discharge of whatever duty he was required to perform. In looking now at the early stages of his career, we see an exhibition of the pluck and pertinacity as well as the shrewd common sense that were afterwards so conspicuous. He was faithful in the few things he was at first called to undertake, thus proving his capacity for higher duties. There is no evidence that he ever sought to push his fortunes at the expense of other commanders, or that he was in haste to rise faster than the government discovered cause for his promotion. His victories were always modestly announced, without the least sign of a purpose to draw attention to himself or win the applause of his countrymen. If he was aware that such modesty on his part was more likely to kindle the admiration of the country than any amount of boastfulness, it is only another evidence of his high soldierly qualities and of his superiority over those who, for want of such perception, were constantly creating obstacles to their advancement. He went quietly and submissively to the discharge of whatever task was assigned him, never grumbling over difficulties, or asking to be placed in a more conspicuous or honorable position. In nothing more than this did he show the qualities of a great soldier, by nothing else did he more endear himself to his countrymen. He was in this respect a gen. after Lincoln's own heart, and it is no wonder that the latter discerned his merits and charged him with greater and greater responsibilities, until at last he exalted him to the post of commander of all the forces in the field. Shortly after entering the service he was advanced from the position of col. to that of brig.gen. of volunteers and assigned to the command of the forces at Cairo. Sept. 6, 1861, he seized Paducah, at the mouth of the Tennessee, and on the 25th, Smithland, at the mouth of the Cumberland, two important strategic points. His next move, a month later, was to check the advance of a rebel force under gen. Jeff. Thompson, which was successfully accomplished by two battles, one at Fredericktown, Mo., the other at Belmont, in the latter of which he had a horse shot under him. The district of Cairo was now enlarged and gen. Grant confirmed in command thereof. In Feb., 1862, he moved from Paducah with 15,000 men, aided by commodore Foote with a fleet of gunboats, for the purpose of capturing fort Henry, on the Tennessee, and fort Donelson, on the Cumberland. The former surrendered Feb. 6, its reduction being mainly the work of the gunboats; the latter was taken on the 16th only after a severe battle in which the land forces were engaged. Buckner, who was in command of the fort, proposed the appointment of commissioners to settle the terms of capitulation; to which gen. Grant replied: "No terms other than an unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." The capture of this fort was the first important and brilliant victory of the federal arms, and it made a great impression upon the country. Gen. Grant was at once made a maj.gen. of volunteers, his commission being dated on the day of the battle. The battle of Pittsburg Landing was next fought. The union forces at that point had lost their commander by death, and while halting were attacked Feb. 6 by a large confederate force under Albert Sidney Johnston and beaten with heavy loss. Gen. Grant arrived on the field at the critical moment and reformed the broken union lines, and heavy re-inforcements under gen. Buell having arrived, the battle was renewed on the 7th and the confederates driven back to Corinth. The loss on each side in this battle was 12,000 men, and gen. Grant was slightly wounded. Gen. Halleck being called to Washington, gen. Grant was assigned to the command of the department of the Tennessee, with headquarters at Corinth, which the confederates had evacuated. Here he was much annoyed by spies and guerillas, against whom he adopted the most energetic measures. He next fought the confederate gen. Price at Iuka and defeated him. He then removed his head-quarters to Jackson, leaving Rosecrans with 20,000 men to hold Corinth, which he did successfully, though attacked by a force twice as great as his own. In Oct. gen. Grant's department was enlarged by a portion of Mississippi, including Vicksburg, the forces under his command being designated as the 13th army corps. After several unsuccessful efforts to capture Vicksburg, it was besieged May 18, and surrendered July 4, 1863, with about 27,000 prisoners. Gen. Grant was now appointed a maj.gen. in the regular army, and in Oct. placed in command of the military division of the Tennessee, comprising the departments commanded by Sherman, Thomas, Burnside, and Hooker. His next exploit was the defense of Chattanooga by driving the forces of Bragg from Missionary ridge and Lookout mountain. Gen. Halleck, in his annual report to the war department, said that in view of the strength of the rebel position and the difficulty of storming his intrenchments, "the battle of Chattanooga must be considered the most remarkable in history. Not only," he continues, "did the officers and men exhibit great skill and daring in their operations on the field, but the highest praise is due to the commanding gen. for his admirable dispositions for dislodging the enemy from a position apparently impregnable." Congress at its next session promptly returned thanks to gen. Grant and his army, and ordered a gold medal to be struck in his honor. Congress also revived the grade of lieut.gen. in the army, whereupon gen. Grant was nominated by president Lincoln for the position, and the nomination promptly confirmed by the senate. He came to Washington, received his commission at the hands of president Lincoln, and returned with all speed to Tennessee. In a letter to gen. Sherman, written after his appointment, he frankly acknowledged his success in

the field was "due to the energy, skill, and the harmonious putting forth of that energy and skill, of those whom it has been my good fortune to have occupying subordinate positions under me." His first general order as commander was issued Mar. 12, 1864, and announced that his head-quarters would be in the field, and, until further orders, with the army of the Potomac. The war, which had existed for three years, and been attended with immense sacrifice of life and property, and an unwavering hope of final victory for the union and liberty, was now approaching its culmination. The successes of gen. Grant in subordinate positions had awakened among the northern people a perfect assurance that, as commander of all the union forces, he could not fail to bring the conflict to a speedy and honorable conclusion. His quiet confidence in himself was sustained by the hearty devotion of the army and the support of a united people. The battles of the next year, which had for their object the capture of Richmond, at which point the secessionists had concentrated their main army for a last and desperate resistance, were the bloodiest of the whole war. The first movements of gen. Grant, though unsuccessful as to his main design, resulted in crippling the enemy and so preparing the way for final victory; but they were attended with great loss of life. In the campaign from the Rapidan to the James, between May 3 and June 15, the union loss in killed, wounded, and missing, was 54,551. The confederate losses are estimated at 32,000. Gen. Grant, having failed in his flanking movements, saw at last that his only hope of seizing Richmond depended upon first taking Petersburg, and to this object he now addressed himself with his usual pluck and pertinacity. Lee attempted to create a division by a movement on Washington, but was foiled and driven back by Sheridan. Sherman meanwhile had forced Hood to evacuate Atlanta, and was on his famous march to the sea. Lee was so effectually beleaguered by Grant in the approach to Richmond that he was unable to send reinforcements tc his generals at other points, and the confederacy was rapidly falling to pieces. At length, on April 2, 1865, Petersburg fell, and on the 3d the union forces entered Richmond, the confederates fleeing as they advanced. Grant pursued the flying army, caught and surrounded it, and forced it to surrender at Appomattox court-house, April 9. Lee, with 27,000 men—all that remained of his army—was captured, and the confederacy overthrown. Grant's entire loss in the campaigns of the year was 12,663 killed, 49,559 wounded, and 20,498 missing; total, 82,720. In the same time he had captured more than 66,000 confederate soldiers; how many he had killed and wounded is not known. The terms granted to Lee were most magnanimous, and all the forces of the confederacy made haste to disband on similar conditions. The rebellion was put down, the union restored, and Grant was the hero of the day. The assassination of Lincoln and the accession of Andrew Johnson quickly followed, and then came the excitement of the period of reconstruction, in which gen. Grant, for whom congress had created the rank of gen. of the army, bore a loyal and honorable part. In 1868 he was elected president, receiving 214 electoral votes, to 80 cast for Horatio Seymour. In spite of unfortunate divisions in the republican party, he was re-elected in 1872, receiving 286 electoral votes, while but 42 were cast for the opposing candidate. At the close of his second term, in 1877, he made the tour of the whole civilized world, visiting especially all the great nations of Europe and Asia, and receiving, as a great soldier and civilian and the first citizen of the United States, all the honor which rulers and people could bestow. As the unofficial representative of his country, in the nations he visited his bearing was such as to win universal admiration and respect. His intercourse, moreover, with the rulers and other representative men abroad, was, no doubt, calculated to remove the prejudices and conciliate the good-will of foreign nations toward the great republic of the new world. On his return home in the spring of 1880, a large and influential portion of the republican party sought to make him a candidate for the presidency once more; but the movement was defeated, not because the people did not still admire and trust him, but on account of the formidable opposition to bestowing the office upon any man, however eminent or noble, for more than two terms.

GRANT, Sir WILLIAM, an eminent lawyer, was descended form the Grants of Baldornie, and was b. at Elchies in Strathspey, in 1754. He was some time attorney-general in Canada, then M.P. for Shaftesbury, and subsequently for Banffshire; was sixteen years master of the rolls, from which he retired in 1817, and died in 1832. Lord Brougham describes him as the greatest magistrate that ever adorned the English bench; and Charles James Fox declared that he was the only man in the house of commons whom he had any diffidence in replying to. This arose from the fact, that Grant was a most logical debater and close reasoner.

GRANTHAM, a municipal and parliamentary borough and market-town of England, in the co. of Lincoln, is situated on the left bank of the Witham, 23 m. s.s.w. of the city of Lincoln, and about 110 m. n.n.w. of London. Grantham has a free grammar-school, with an income from endowment of £800 a year. The parish church, a beautiful structure of the 13th c., has a fine spire 273 ft. high. Here Newton was instructed in classics before entering Cambridge. A canal 30 m. long connects this town with the river Trent. The trade is chiefly in malt, corn, and coal. Grantham returns two members to the imperial parliament. Pop. of parl. bor. '71, 13,250.

GRANULA'TIONS, the materials of new texture as first formed in a wound or on an ulcerated surface. See INFLAMMATION, CICATRISATION, WOUNDS, ULCER.

GRANVELLE, ANTOINE PERRENOT, Cardinal de, 1517–86; b. France, but a Spanish statesman. He was the son of the chancellor of Charles V.; was thoroughly educated, and excelled as a linguist. Before he was 25 he was bishop of Arras. At the Trent council he defended his sovereign's policy of war upon France, for which he was made a councilor of state. In 1550 he was chancellor, succeeding his father. As a diplomatist he was engaged in the treaty of Passau, and in arranging the marriage of Philip with Mary of England. When Philip came to the throne, Granvelle was made chief-minister, and was principal adviser in the affairs of the Netherlands. After Philip left for Spain, Granvelle became supreme, and soon made his administration odious to the Flemish people, as his whole power was exerted to restore the domination of the church of Rome. He increased his power by bringing in Spanish soldiers, making new bishops, and refusing to call together the general assembly. But when he proposed to establish the inquisition, the wrath of high and low alike centered upon him. He was made a cardinal in 1561. William of Orange, Horn, Egmont, and at last Margaret of Parma (the Spanish regent) asked for his recall. Philip refused, but the unpopular cardinal foresaw trouble and probable danger, and of his own accord asked to be withdrawn. He went to Besançon, and occupied his leisure in literary and scientific studies. Subsequently he negotiated the alliance between Spain, Vienna, and Rome, against the Turks, and was viceroy of Naples. In 1575 he was called back to Spain, and made chief officer of the supreme council, in which capacity he arranged the union between Spain and Portugal, and while Philip was out of the country he acted as regent. He was a patron of literature, and richly endowed the college of Besançon.

GRANVILLE, a co. in n. North Carolina on the Virginia border, crossed by the Raleigh and Gaston railroad, and drained by Tar river; 750 sq.m.; pop. '80, 31,285—17,683 colored. The surface is hilly and the soil fertile. The main productions are corn, oats, wheat, tobacco, and cotton. Co. seat, Gaston.

GRANVILLE, a t. and village in Washington co., N. Y., on Pawlet river, and the Rensselaer and Saratoga railroad, 66 m. n. of Albany; pop. of township in '80, 4,149. Granville female seminary is in the n. village. Granville proper has some manufactures, good schools, and a number of churches. Near by are quarries of excellent slate.

GRANVILLE, a t. and village in Licking co., Ohio, on Raccoon creek, about 25 m. e. of Columbus, a short distance from a station on the Baltimore and Ohio railroad; pop. of township 2,127. The Denison university (Baptist) in the village, has a fine library. The Granville female college is also a prominent educational institution, and there are good public schools.

GRANVILLE, a fortified t. and seaport of France, in the department of La Manche, is situated on a promontory surmounted by a fort, 23 m. n.e. of St. Malo. It is a badly built, dirty, and uninteresting town; the extensive new pier, built in a sufficiently strong manner to admit of its being mounted with cannon, and the old parish church of gray granite, built in the flamboyant style, being almost the only noteworthy features. Its harbor, though well-sheltered and capable of accommodating 90 ships, is always dry at low water. The principal trade of Granville is in the whale, cod, and oyster fisheries. Pop. '76, 12,372.

GRANVILLE, GRANVILLE GEORGE LEVISON GOWER, Earl, b. England 1815; educated at Oxford; in 1836 in the embassy to France; the next year in parliament, and re-elected in 1837. In the commons he was a liberal and a free trader. He became a peer in 1846, vice-president of the board of trade in 1848, and went into the cabinet in 1851, at the close of that year succeeding Palmerston in the foreign office. He retired with the Russell ministry. In 1853 he was president of the council, and two years afterwards undertook the ministerial leadership in the house of lords. In 1850 he was vice-president of the royal commission for the great exhibition to which enterprise he rendered important services. In 1856 he was special representative of his government at the coronation of the czar. Besides filling other positions, the earl has been colonial secretary for foreign affairs (succeeding Clarendon). When Gladstone retired from the leadership of the opposition, Granville, by general consent, was looked upon as the leader of the liberals.

GRAPE. See VINE, *ante*.

GRAPE-HYACINTH (*Muscări*), a genus of bulbous-rooted plants, of the natural order *liliaceæ*, nearly allied to the hyacinth, but differing in the globose or subcylindrical perianth, contracted at the mouth, and 6-toothed. The species are natives chiefly of the countries near the Mediterranean, and the warmer temperate parts of Asia. Some of them are frequent in our flower-borders. *M. moschatum* has a smell of musk. *M. racemosum* is a somewhat doubtful native of the s. of England. The flowers of the grape-hyacinths are mostly blue.

GRAPE-SHOT, called also *tier-shot*, consist of bullets or small iron balls piled round an iron pin, holding together a series of parallel iron plates (each the diameter of the cannon used), between which are the shot, kept in their places by holes in the plates.

Small 3½ in. or 4 in. shells are also quilted together like grape for firing from mortars at short range, as, for example, in clearing the covert-way of a fortress from the third parallel. In either case, the explosion of the charge bursts asunder the binding, and the shot (or shells) begin to scatter directly on leaving the muzzle of the piece. Grape are very formidable against dense masses of troops; but, of course, only at comparatively short ranges. The shot employed differ in weight from 6 oz. to 4 lbs., according to the caliber of the gun from which they are fired.

GRAPE-SUGAR. See SUGAR; and GLUCOSE.

GRA'PHIS (Gr. *grapho*, to write), a genus of lichens, which gives its name to a tribe, *graphideæ*, remarkable for the resemblance which the fructification (*apothecia*, or *shields*) assumes to the forms of the letters of oriental alphabets. Hence, some of these little plants have received such names as *Scripture-wort*. A peculiar importance has recently been acquired by some of the *graphideæ*, from their being found only on the bark of a particular species of *cinchona*, so that they guide to the ready identification of some of the most valuable commercial barks.

GRAPHITE. See BLACK LEAD.

GRAPHOMETER, a name sometimes, though inappropriately, given to the protractor, an instrument used in plotting surveys. It is a semi-circle, marked with 180°, and, in large instruments, with parts of degrees. Its use is to lay off angles. See PROTRACTOR.

GRAPH'OTYPE is one among numerous modes invented within the last few years of producing an engraved surface from which printing can be effected by the ordinary press. Line-engraving, mezzotinto engraving, aquatint, and etching present the design or picture in *intaglio* on a metal plate, the lines being cut, and therefore below the surface of the plate; they cannot be printed by ordinary typography, because the ink-roller inks the parts that ought to be left clean, and leaves the lines of the device untouched. Wood-engravings, and stereotypes and electrotypes taken from them, can be printed side by side with type in the same page, and by the same operation; and hence the vast extension of this mode of illustrating books and newspapers. The inventors of *graphotype* are trying to introduce a cheap substitute for engraved wood-blocks. Mr. De Witt Clinton Hitchcock, a draughtsman and wood-engraver, having occasion for a little enamel white powder, scraped some from the surface of a visiting-card, and then observed that the ink-lines remained just as distinct and prominent as before, not having been removed by the scraping. This slight incident suggested the new process—sketching the design on a chalky surface, and brushing away the chalk from between the lines. Mr. Hitchcock's first experiments were partially successful, and he then received aid from others in establishing a *modus operandi*. In the latest form of the process, after many intermediate experiments, the block is superseded by a zinc plate covered with finely-pounded French chalk, brought to a hard and very fine texture by enormous pressure, with a glossy surface produced by an interposed steel plate. On this white surface, sized and dried, the picture is drawn with camel or sable hair pencils, dipped in an ink made of glue and lampblack. When dry, the white or uninked portions are rubbed down by means of a small fitch-hair brush, and pads covered with silk velvet. The rubbing is continued until the white is sunk sufficiently below the level of the inked picture or design. The plate is then saturated with liquid glass or silicate of soda, which converts the French chalk into a kind of marble. The success with which all the white is rubbed down between the inked lines, depends on a variety of circumstances—the hardness of the white, the evenness of the surface, the completeness of the petrifying action by the silicate, the protecting power of the ink or varnish, the quality of the brushes and rubbing-pads, and the careful management of the rubbing itself. Whether the fine lines of the device can be preserved from breaking up into saw-like irregularities, and whether the numerous requirements and qualities of a wood-engraving can be successfully realized, a long course of trial can alone show. The matter has been taken up by a company.

GRAPPLE-PLANT (*Uncaria procumbens*), a procumbent plant of the same genus with the gambir (q.v.), a native of south Africa. The seed-vessel has many hooked thorns, and clings most tenaciously to any animal—a provision for the distribution of the seed. When it lays hold of the mouth of an ox, Livingstone says, the animal stands and roars with pain and a sense of helplessness.

GRAP'PLING-IRON, OR **GRAPNEL**, a sort of small anchor, having several pointed claws, used generally in making fast boats and other small vessels. A similar instrument of more formidable dimensions is employed during action for grappling the rigging of a hostile ship preparatory to boarding.

GRAP'TOLITES, a group of fossil zoophytes, apparently nearly related to the recent sertularia. They had simple or branched polypidoms, formed of a horny substance. The cells in which the polype lived were arranged in a single series on one side of the rachis, or in a double series on both sides; the rachis was generally prolonged beyond the cells at the growing end of the polypidom. Egg capsules have been observed attached to the polypidom, exhibiting a method of reproduction similar to that in the

hydroid zoophytes. The generic division of the graptolites has been based on the arrangement of the cells.

Nearly eighty species of graptolites have been described. They are confined to the Silurian strata, and are most abundant in the hard slaty shales, which were the fine mud of the Silurian seas.

GRA'SLITZ, a small t. of Bohemia, is situated on the border of Saxony, 20 m. n.n.e. of the t. of Eger. It has manufactures of cotton goods, paper, looking-glasses, musical and mathematical instruments, and machinery. Pop. '69, 6,549.

GRAS'MERE, the name of a village and lake in Westmoreland, about 3 m. n.w. of Ambleside. The village, which is beautifully situated at the head of the lake, has an ancient church, containing Wordsworth's grave, which is marked by a plain and modestly-fashioned slab. The lake is upwards of a mile long, and about half a mile broad, is oval in form, and incloses a small island. It is girdled about by high mountains, and forms one of the most beautiful scenes in England. Pop. '71, 805.

GRASS (in Law). The grass growing on lands belongs to the person entitled to the soil, and at his death goes to the heir, and not to the executor. The period of entry as to grass-farms in Scotland is Whitsunday. Where the cattle of strangers are put into the fields of a tenant in Scotland to graze, the landlord cannot sequestrate the cattle for his rent; whereas, in England, he may distrain the cattle, and pay himself the rent.

GRASS CLOTH, a name often, although erroneously, given to certain beautiful fabrics manufactured in the east from different kinds of fibers, none of which are produced by grasses. One of these fabrics is made from the fiber of *Bœhmeria nivea*, popularly called China-grass; another, also known as *pina muslin*, from the fiber of *bromelia pigna*. See BŒHMERIA and BROMELIACEÆ.—The kinds of cloth really made from the fiber of grasses are extremely coarse.

GRASSE, a manufacturing t. of France, in the department of Alpes-Maritimes, is situated in the midst of flower-gardens, on the southern slope of a hill, 23 m. e.n.e. of Draguignan. The streets are steep, narrow, and crooked, but the houses are well built. The principal buildings are the college, hospital, and ecclesiastical school. Grasse is second only to Paris in its manufactures of essences and perfumes, made from the roses, orange-flowers, heliotropes, mint, etc., which, from the mildness of the climate, are most successfully grown in the vicinity. It has also manufactures of woolen goods, soap, leather, and olive oil; several silk-spinning factories and tanneries; and a considerable trade in oranges, citrons, wax, and honey. Pop. '76, 9,673.

GRASSE, FRANCOIS JOSEPH PAUL DE, Count and Marquis de Grasse-Tilly, 1723-88; joined the naval service of the knights of Malta in 1734, serving in Turkish and Moorish wars. In 1749 he entered the navy of France and speedly rose to be rear-admiral and chief of squadron. In 1781 he came to the assistance of the American patriots, and was instrumental in the reduction of Yorktown. Subsequently he served in the West Indies where he was utterly defeated by Rodney, the British commander.

GRASSES, *gramineæ* or *graminaceæ*, a natural order of endogenous plants, containing almost 4,000 known species, about one-twentieth of all known phanerogamous plants; whilst the *social* habit of many of them, and the vast number of individual plants within even a limited tract, give them a still greater proportion to the whole phanerogamous vegetation of the earth. They are distributed over all parts of the world; some are characteristic of the warmest tropical regions, and some of the vicinity of perpetual snow; but they abound most of all, and particularly in their social character, clothing the ground with verdure, and forming the chief vegetation of meadows and pastures, in the northern temperate zone. There is no kind of soil which is not suitable to some or other of the grasses; and whilst some are peculiar to dry and sterile soils, others are only found on rich soils with abundant moisture; some grow in marshes, stagnant waters, or slow streams, some only on the sea-coast; none are truly marine. Some grasses are annual, and some perennial; they have fibrous roots; the root-stock often throws out runners; the stems (*culms*) are round, jointed, generally hollow, except at the joints, rarely filled with pith, generally annual, and of humble growth, but sometimes perennial and woody, occasionally—as in bamboos—attaining the height and magnitude of trees. The leaves are long and narrow, alternate, and at the base sheath the culm; the sheath is split on the side opposite to that from which the blade springs; and at the junction of the blade and sheath, there is often a short membranous prolongation of the epidermis of the sheath, called the *ligule*. The flowers are generally hermaphrodite, but sometimes unisexual, and more frequently so in the grasses of tropical than in those of colder climates; they are disposed in *spikelets*, and these again generally in spikes, racemes, or panicles; they have no proper calyx nor corolla, but consist of the parts of fructification inclosed in two series of small bracts, some or all of which are sometims awned. See AWN. The two outer bracts of each spikelet are called *glumes*. In some grasses, only one glume is properly developed for each spikelet. Within the glumes are the *florets* forming the spikelet, sometimes only one, but often a larger number, each floret having generally two small bracts called *palæ* or *glumellæ*, the immediate covering of the parts of fructification. The glumes were called the calyx by the older botanists, and the palæ the corolla, but inaccurately. The stamens are hypogynous, sometimes only one, sometimes six or more, but very generally three, the anthers

attached to the filaments by the middle of their back, and easily moved by the slightest breeze. The ovary is simple, one-celled; the styles two or three, sometimes united; the stigmas feathery or hairy. The fruit is a *caryopsis*, the pericarp being incorporated with the seed; the seed consists of a small embryo, lying at the base and on the outside of a large farinaceous albumen, from which arises in great part the extreme importance of this order of plants to man; the farinaceous seeds of some of the grasses being the corn or grain which form a chief part of human food. The grasses cultivated on this account are noticed in the article CEREALIA and in separate articles. Starch is the principal substance entering into the composition of these farinaceous seeds, and is often extracted from them, either to be used by itself as an article of food, or for other economical purposes, according to the kind. Besides starch, they contain, in greater or less proportions, gluten and other similar substances, on which not a little of their nutritive value depends. The peculiarities of composition of the most important grains are noticed in the article BREAD, or under their separate heads. When, by the process of *malting* (see BEER), great part of the starch of the grain has been converted into sugar, a fermented liquor is made from it, of which beer or ale made from barley is the most familiar example; and from this, again, a spirituous liquor—as whisky—is obtained by distillation. Fermented and spirituous liquors are commonly made from different kinds of grain in different parts of the world, particularly barley, maize, rice, and millet.—Sugar is another important product of grasses, existing in large quantity in the stems of many species, and particularly abounding in the soft, internal part of some, as sugar-cane, maize, and shaloo or sugar-grass (*sorghum saccharatum*, see DURRA), from which it is extracted for use. The sugar-cane yields far more sugar than all the other plants cultivated on that account in the world. Rum—obtained by fermentation and distillation from sugar—is another well-known product of the sugar-cane, and similar liquors may be obtained from the other sugar-producing grasses.—Besides these uses, grasses are also of great importanee as affording pasture and fodder (*hay* and *straw*) for cattle. See FODDER.—The woody stems of the larger grasses are applied to a great variety of economical purposes. See BAMBOO. Those of some of the smaller grasses are much used for thatch, and are also made by plaiting into straw-hats, ladies' bonnets, etc. See STRAW-MANUFACTURES.—The underground runners of some species, as the marrum grass and sea lyme grass, make them particularly useful for binding and fixing loose sands.—The stems and leaves of many grasses have fibers of such length and strength that they are twisted into coarse ropes for many purposes in which no great durability is required. Thus, hay and straw ropes are commonly used on every farm in Britain, and different grasses are used in the same way in many parts of the world. Some grasses, as the moonja (*saccharum munja*) of India, are not simply twisted into ropes, but their fibers are first separated by moistening and beating; and the fibers of some, as the esparto (q.v.) of Spain, are made not only into ropes, but into mats, sacks, and other very coarse fabrics.—The Chinese make paper from the young shoots of bamboo; paper is also made from the straw of rye, wheat, barley, and oats, and might be made from that of many grasses. See PAPER.—The perennial roots and runners of some grasses contain peculiar substances, on account of which they are used medicinally, as those of couch-grass. The stems and leaves of some contain coumarin (q.v), and have a very agreeable fragrance when dried, as in the case of the sweet-scented vernal grass (*anthoxanthum odoratum*) of Britain. A few, chiefly East Indian species, contain other aromatic and fragrant substances in the stem and root particularly lemon grass, vittievayr, and other species of *andropogon*, which yield grass-oil (q.v.).—It has been alleged that the seeds of a few grasses are poisonous, but this in every case requires confirmation, although darnel (q.v.) in particular has a bad reputation.—The stems, leaves, and glumes of grasses contain a large proportion of silica, particularly the epidermis, so that when large quantities of them are burned, a sort of glass is formed; a fact which requires attention in questions relative to the manures proper for particular crops, and the most profitable alternation of crops in husbandry. The following are the tribes into which botanists have divided the natural order of grasses, with the names of some of the most important, as examples:

Oryzeæ.	Rice.
Phalareæ.	Maize; Job's tears (*Coix*); Canary grass; foxtail grass; soft grass; timothy grass.
Paniceæ.	Millet (of various kinds); fundi; Guinea grass.
Stipeæ.	Feather grass; esparto.
Agrosteæ.	Bent grass.
Arundeæ.	Reeds; marrum grass; pampas grass.
Pappophoreæ.	
Chloreæ.	Cord grass (*Spartina*); *cynodon; Eleusine.*
Aveneæ.	Oats; vernal grass; *aira.*
Festuceæ.	Fescue; meadow grass; manna grass; teff; cock's-foot grass; tussac grass; dog's-tail grass.
	Sub-tribe *Bambusidæ*—Bamboos.
Hordeæ.	Wheat; barley; rye; spelt; rye-grass; lyme grass.
Rottbælleæ.	Gama grass.
Andropogoneæ.	Sugar-cane; shaloo or sugar grass; durra; lemon grass; vittievayr.

The word *grass* is probably from the same root as Lat. *cresco*, Eng. *grow*.

Among farmers, the term grasses is extended to include, along with the true grasses, other plants cultivated for fodder and forage, such as clover, etc., and these are distinguished by the term *artificial grasses*, whilst the true grasses are called *natural grasses*.

GRASSHOPPER, the English name of many species of insects, forming a family of the order *orthoptera*, section *saltatoria*, called *gryllidæ* by some (chiefly English) entomologists, and *locustidæ* by others—those who adopt the former name designating the crickets (q.v.) *achetidæ*. Locusts (q.v.), however, do not belong to this family, although very closely allied, but are distinguished from it by greater robustness of frame, shorter legs, and shorter antennæ. The antennæ of the grasshoppers are long and threadlike, as in the cricket. The wings of grasshoppers, as of locusts, fold together like the sides of a roof, while those of crickets are horizontal when at rest. Grasshoppers, like crickets and locusts, have the thighs of the hinder legs very large and adapted for leaping. But grasshoppers do not leap with so great energy as locusts, nor are they capable of so sustained a flight. There are, indeed, some of the family in which the wings are merely rudimental, and the elytræ or wing-covers of small size. Most of them, however, have well-developed wings ; and the wing-covers of the males, as in crickets, have a spot at the base of a talc-like appearance, by the rubbing together of which that chirping sound is produced which is probably connected with the sexual instincts of the insects, but which we have learned to associate with the brightest of green pastures and of sunshiny days. Grasshoppers are herbivorous. They are numerous in most parts of the world. The largest British species is the great green grasshopper (*gryllus viridissimus*, also known as *locusta viridissima* and *acrida viridissima*), about 2 in. in length, and of a fine green color; a somewhat rare insect in Britain, although not uncommon in some parts of Europe. A green color prevails among the grasshoppers of Britain, and generally of temperate climates, enabling them more readily to elude observation among the herbage in midst of which they live; but some of the tropical species are richly colored, and some have very large wings, almost like those of lepidopterous insects. The greater number of grasshoppers feed on grass and the leaves of herbaceous plants, but some prefer the leaves of trees.

GRASSMAN, HERMANN GÜNTHER, b. Prussia, 1809; a mathematician, son of a professor of mathematics in the Stettin gymnasium, to whose chair he succeeded. In 1844 he published the first part of an important mathematical work in which he explained certain discoveries in the science. He has published several other works, the leading purpose of which is to establish a new system of mathematical processes covering wider ground and tending to supersede the plans and theories of Descartes.

GRASS-MOTH (*Crambus*), a genus of small moths, allied to the clothes-moths, of which the species are numerous, inhabiting pastures, where they are often seen to rise in great numbers when disturbed, and soon to settle again on the blades of grass. Their form, when their wings are closed, is long and narrow, pointed at the head, abruptly cut off at the opposite end. They are often brown and white, sometimes silvery and golden.

GRASS-OIL, a fragrant volatile oil obtained from the leaves and stems of certain grasses of the genus *andropogon* (see LEMON GRASS), natives of India. The kind known as *grass-oil of Nemaur* is produced at the foot of the Vindhya hills, and is exported from Bombay. It has been ascribed to the grass called vittievayr or cuscus (*A. muricatus*); to another species, which Dr. Royle supposes to be the *calamus aromaticus* of the ancients; and to a third, also like these, a very fragrant grass (*A. iwarancusa*). It is not improbable that it may be obtained from more than one species. It is obtained by distillation; the grass, being cut when it begins to flower, is bound in small bundles, which are thrown into a boiler with water, and the oil, as it distils over, is received in cold water, from which it is afterwards skimmed. It is of a light straw color, has a peculiar rich, agreeable odor, and is very pungent and stimulating. It is employed in medicine, as a stimulant and diaphoretic, but more frequently as a liniment in chronic rhematism. Its chief use, however, is in perfumery. It is sometimes called *ginger-grass oil*, but is commonly called *oil of geranium* by perfumers, and by druggists *oil of spikenard*.—Similar to this, but different, and obtained from other species of the same genus, is the oil known as oil of lemon grass.

GRASS OIL. See CITRONELLA.

GRASS OF PARNAS'SUS, *parnassia*, a genus of plants, generally regarded as belonging to the natural order *droseraceæ*, but referred by Lindley to *hypericaceæ*. The calyx is deeply 5-cleft, there are 5 petals, 5 stamens, and 5 scales fringed with globular-headed threads alternate with the stamens, which are regarded by Lindley as bundles of altered stamens; there are four stigmas, and the fruit is a 1-celled, 4-valved capsule with many seeds. The genus consists of a few small herbaceous plants, with flowers of considerable beauty, growing in wet situations in the colder northern parts of the world. Some of them are found within the arctic circle, and to the snow-line of the Alps, Himalaya, and other mountains. The common grass of parnassus (*P. palustris*) is an ornament of bogs and wet places in Britain and other parts of Europe, with heart-shaped leaves, mostly radical and on long foot-stalks, and one sessile leaf on the stem, which is about eight or ten in. high, and bears a solitary yellowish-white flower. It

flowers in autumn. It is called *agrostis en to parnasso* by dioscorides, whence its modern name.

GRASS TREE, *Xanthorrhœa,* a genus of plants of the natural order *liliaceæ,* natives of Australia, and constituting a very peculiar feature in the vegetation of that part of the world. They have shrubby stems, with tufts of long wiry foliage at the summit, somewhat resembling small palms; a long cylindrical spike of densely aggregated flowers shooting up from the center of the tuft of leaves. The base of the inner leaves of some species is eatable, and forms, particularly when roasted, an agreeable article of food. It has a balsamic taste; and all the species abound in a resinous juice, which, on exposure to the air, hardens into a reddish yellow inodorous substance with a shining fracture, soluble in alcohol, and useful as a tonic in dysentery, diarrhœa, and other intestinal maladies; used also by the natives of Australia for uniting the edges of wounds, and with an aluminous earth for caulking their canoes, and as a cement for various purposes. The common grass tree (*X. hastilis*) has a stem about four feet high, but sometimes a foot in diameter. It is of very slow growth, and is supposed to be many centuries old when it has reached such dimensions.—Several species are found in eastern Australia, where their leaves are used as fodder for all kinds of cattle.

GRASSUM, in the law of Scotland, is a lump sum paid by persons who take a lease of landed property. In the case of entailed estates, the heir in possession is generally prohibited from taking large sums in the form of a grassum, and letting the property at a lower rent, because it tends to prejudice those who succeed him in the property. In England, the word is not used, but the word premium in some cases, and fine in others, means the same thing. Where a person is entire owner or freeholder, he is entitled to let his land at any rent he pleases, and to stipulate for a grassum as large as he can get.

GRASS VALLEY, a village in Nevada co., Cal., about 50 m. n.n.e. of Sacramento, in the midst of the richest gold mines of the state; pop. 7,063. It is the seat of a Roman Catholic bishop, and has a convent, a number of Protestant churches, and two orphan asylums. Quartz mills and iron foundries are prominent business establishments.

GRASSWRACK, *zostéra,* a genus of plants of the natural order *naiades,* one of the few genera of phanerogamous plants which grow amongst sea-weeds at the bottom of the sea. The leaves are narrow and grass-like; and the flowers consist merely of stamens and pistils, without any perianth, inserted on the central nerve of one side of a flat thin linear *spadix,* with a leafy *spathe.* The pollen is confervoid.—The common grasswrack (*Z. marina*) is a perennial plant, which forms green meadows on the sandy bottom of shallow parts of almost all the European seas, and abounds in creeks and salt-water ditches. It is found in great plenty on the British shores. It becomes white by exposure to the air. The rush-like coverings of Italian liquor-flasks are made of it, and it is much used for packing glass bottles and other brittle ware. It has been long used in Holland, Gothland, and Iceland for stuffing pillows and mattresses, and this use has of late years very much extended, so that the plant has become an article of commerce, under the name *alga marina,* or more commonly, but incorrectly, *alva marina* (Ger. *see-gras*).

GRATE, the iron cage which supports the coal for a common fire. Considerable improvements have been made of late years in the construction of common domestic grates. Our forefathers simply added an iron cage to the old form of fire-place built originally for burning a pile of wood. This was a large square-sided recess, with a very wide opening for the chimney. Count Rumford pointed out the disadvantages of this, and the principles upon which they should be remedied. See CHIMNEY. In the modern grate, the filling up of the square cavity recommended by count Rumford, and also his plan of lowering and narrowing the throat of the chimney, are usually effected by iron plates forming part of the grate. These plates are readily heated, and with equal readiness radiate and reflect the heat into the room, and thereby effect a considerable saving of coal, besides which the grate itself is brought forward level with, or even projecting beyond, the walls of the room, whereby the radiation from the heated coal is utilized to the utmost. One of the most effective as well as elegant forms of grate is that which consists simply of a large square iron plate set nearly flush with the wall, in the middle of which is a hemispherical cavity with bowed bars in front, and a trapped opening into the chimney in the upper part of this cavity. When there is a fair draught, this form of grate gives a good fire, and effects the maximum economy of fuel for an open fire-place (which of course is always somewhat wasteful compared with a stove). The curved surface behind and above the fire radiates and reflects into the room from every part of its surface, and the plate flush with the wall, which is heated by conduction, may be regarded as a part of the room, and thus the main condition of economy is effected, viz., throwing as much as possible of the heat into the room, and allowing as little as possible to go up the chimney. A lining of firebrick or of fireclay, molded to the form of the back of the grate, is useful in retaining the heat which is necessary for complete combustion of coal; the firebrick, being a bad conductor and an excellent radiator, becomes red-hot on its surface next to the coal, and this heat is not carried away, but is radiated into the fire, and assists in burning the carbon of the smoke. The conditions for securing an effective draught are treated under CHIMNEY.

GRA'TIAN, the collector of the well-known body of canon law which is commonly cited under the title of *decretum gratiani.* It is singular, however, that although few authorities have been so frequently cited, or have obtained so wide and permanent acceptance as this celebrated collection, hardly anything is known of the collector's own personal history. The sum of our knowledge regarding him is, that he was a native of Chiusa in Tuscany, and that he became, in later life, a Benedictine monk of the monastery of St. Felix in Bologna. The date commonly assigned to Gratian's collection is 1141 or 1151; its title, however, *decretum,* or *concordia discordantium canon,* is believed to be of later origin. How far the collection is the work of Gratian himself, or how far he was indebted for his materials, and even for their arrangement, to the labors of earlier collectors, it is difficult to determine. The work consists not only of the decrees of councils and popes down to Innocent II. (including the spurious ISIDORIAN DECRETALS, q.v.), but also of passages from the Scripture, from the fathers, and even from the Roman law. It is divided into three parts. The first regards the hierarchical constitution of the church, and chiefly relates to doctrinal and moral subjects. It is divided into "distinctions." The second treats of external jurisdiction, under the head of "causes" and "questions." The third regards the inner life of the church—the liturgy and the sacraments. From what has been already said regarding his adoption of the Isidorian decretals, it will be inferred that in point of criticism Gratian's authority is of little value, and, in general, it may be added that no authority is given to any document beyond what it intrinsically possesses, from the fact of its being placed in Gratian's collection. For the other collectors of the canon law, see CANON LAW. The date of Gratian's death is unknown.

GRATIA'NUS, AUGUSTUS, eldest son of Valentinian I., by his first wife Severa, was born at Sirmium in Pannonia, on April 19, 359 A.D. While he was still *nobilissimus puer* (or heir-apparent), he was created consul, and in 367 was elevated by his father to the rank of Augustus at Ambiani, or Amiens, in Gaul. In the following year he accompanied his father in his expedition against the Alemanni, in order that he might be accustomed to warfare. On the death of Valentinian the troops elevated Gratianus to the throne, giving him at the same time as a colleague his half-brother Valentinian II. Gaul, Spain, and Britain fell to Gratianus's share; and as his brother was only four years old, Gratianus is supposed by many authorities to have been the monarch *de facto* of the rest of the western empire, fixing his residence at Treviri (now *Treves*). During the first part of his reign, a fierce warfare was carried on against the tribes who possessed the Danubian provinces and Illyricum; and he was on the point of marching into Thrace, to assist his uncle Valens against the Goths, when he was suddenly called upon to defend his dominions against the Lentienses, a tribe of the Alemanni. After the invaders had been defeated Gratianus advanced towards the eastern empire, but while on the way, he learned that his uncle Valens had been defeated and killed by the Goths near Adrianople (Aug., 378). The sovereignty of the eastern empire then devolved upon Gratianus, but feeling his inadequacy to the task of ruling the whole empire, he recalled Theodosius (q.v.) from Spain, and appointed him his colleague on Jan. 19, 379. Gratianus possessed some admirable virtues: he was pious, chaste, and temperate; his understanding was well cultivated, although not strong, and his eloquence attractive. But his character was too yielding and pliant, and he was consequently often led to the commission of gross acts of cruelty and tyranny, utterly foreign to his nature. His persecution of the pagans, and afterwards of heretic Christians, made him a great favorite with orthodox ecclesiastics, but rather alienated the affections of his subjects generally, while his fondness for frivolous amusements, and unworthy associates, excited the contempt of the army, so that when Maximus was proclaimed emperor by the legions in Britain, crowds of the disaffected flocked to his standard. Gratianus was defeated by him near Paris, and afterwards fled to Lyons, where he was overtaken and killed by Andragathius, whom Maximus had sent in pursuit of him, on Aug. 25, 383.

GRATIANUS, FRANCISCUS, a monk of Bologna of the 12th century. He is known from a collection of decretals or church canons bearing his name. He is charged with extending the power of the papacy by teaching that the pope himself was not subject to the canons.

GRATI'OLA, a genus of plants of the natural order *scrophularineæ,* having a 5-partite calyx, the upper lip of the corolla bifid, the lower trifid, only two stamens fertile, and the anthers pendulous. *G. officinalis,* sometimes called HEDGE HYSSOP, is found in meadows and on the margins of ponds and river-banks in most parts of Europe, but not in Britain. It has sessile lanceolate serrulated leaves, and axillary solitary flowers. It is extremely bitter, acts violently as a purgative, diuretic, and emetic: and in overdoses is an acrid poison. It is administered in cases of worms, jaundice, dropsy, scrofula, mania, and venereal diseases; but requires to be used with caution. It is said to render some of the Swiss meadows useless as pastures. It was formerly so highly esteemed as a medicine, that the name of *Gratia Dei* (Grace of God) was given to it, and for the same reason it is known in France as *herbe au pauvre homme* (poor man's herb). It is said to be the basis of the famous gout medicine called *eau medicinale.*—*G. peruviana,* a

South American species, has somewhat similar properties. These properties are supposed to depend upon a bitter resinous principle called *gratioline.*

GRATIOT, a co. in central Michigan, intersected by Prairie river, and crossed by the Saginaw Valley and St. Louis railroad; 576 sq.m.; pop. '74, 13,886. It has an undulating surface and much is yet forest land. The soil is fertile. Lumber, hay, wheat, corn, and oats are the principal products. Co. seat, Ithaca.

GRATIOT, CHARLES, 1788—1855, born Mo.; graduated at West Point in 1806, entering the corps of engineers, and was made capt. in 1808. He was chief of engineers under gen. Harrison in 1813-14, and took part in the defense of fort Meigs, April-May, 1813, and the attack on fort Mackinac, Aug. 4, 1814. He was made maj. in 1815, lieut.col. in 1819, col. and chief of engineers in 1828, and the same year brig.gen. by brevet. He was inspector of the academy at West Point, 1828-38. Dec. 6, 1838, he was dismissed from the service.

GRATRY, AUGUSTE JOSEPH ALPHONSE, Abbe, 1805-72; b. France. He was chaplain of a normal school and director of a college in Paris. With others he founded the "oratory of the immaculate conception," a society of priests, devoted particularly to the instruction of the youth of the city. In 1861 he became vicar-general of Orleans, and two years later professor of moral theology in the Sorbonne. About this time he published a *Course of Philosophy.* He afterwards vehemently opposed Renan and the rationalists generally. In 1867 he was made a member of the academy. He favored Pere Hyacinthe for a time, and was censured by his superiors.

GRATTAN, The Right Honorable HENRY, was b. in Dublin July 3, 1746. His father was recorder and M.P. for that city until his death in 1766. The year after that event, having completed his university studies with distinction at Trinity college, Dublin, Grattan entered as a student of law at the Middle Temple, London, where, however, he neglected the pages of Blackstone, to listen to the living oratory of parliament, and in particular of lord Chatham. In 1772 he was called to the Irish bar, and in 1775 was returned to the Irish parliament as representative for the borough of Charlemont, for which he sat until 1790, when he was elected as one of the representatives of the city of Dublin, to such an extent had his patriotism and eloquence recommended him to the Irish people. Mainly to him was owing, among other things, the partial abolition of the heavy restrictions on Irish commerce. But his popularity ebbed as it had flowed (and oftener than once) in the hearts and huzzas of his impulsive and therefore inconstant countrymen. In 1797 he declined to come forward for Dublin, and went into temporary but undeserved eclipse. In 1800 he was returned for the borough of Wicklow, to oppose the union, and that was to fight for the people's idea of the constitution. But the union was effected in spite of him, and in 1805 he was returned to the imperial parliament for the borough of Malton, in Yorkshire. Next year, he was induced to stand for Dublin, and was re-elected. He sat for it in successive parliaments till his death, which happened on June 4, 1820, in London, to which he had gone when in a weak state of health, contrary to the advice of his physicians, to advocate, as he had been wont, the cause of Catholic emancipation.

Grattan's public and private character was unimpeachable. For the vacillations of his popularity in Ireland, his countrymen had reason to be ashamed, and it is certain that he now holds a proper and exalted place in the esteem of the people, for whom he labored with such sincerity, integrity and genius. The history of his life is in great measure the history of the Irish constitution, and entirely the history of the parliament of Ireland. His *Life and Times* was published by his son.

As an orator, he stands in the first rank. His style is full of point, rapidity, antithesis, and poetic suggestiveness. His eulogy on Chatham, and his invective against Bonaparte, are not surpassed in British eloquence. Byron declares him to be an orator—

> With all that Demosthenes wanted, endowed,
> And his rival or master, in all he possessed.

His speeches were published by his son and biographer. A statue of Grattan, on College Green, Dublin, was unveiled in 1876.

GRATTONI, SEVERINO, b. Italy 1816; educated as an engineer, and was consulted by Cavour on the Mont Cenis tunnel and other important works. Grattoni became the head director of the great tunnel which was completed in 1871. He was for a time a member of the Italian chamber of deputies.

GRATUITOUS DEED, in the law of Scotland, means a deed granted without any value received. If it is made in favor of a third party, in order to defeat creditors, it is null and void, by stat. 1621 c. 18. There is this peculiarity, also, that when a person is too generous, and contracts voluntarily to give away property at a future period, if he become destitute in the meantime, the court will, at least where the deed was in favor of children or grandchildren, retain sufficient for his own subsistence. This is in imitation of the Roman law as to *beneficium competentiæ,* but the Roman law went further. Such a provision is wholly unknown in England. In England gratuitous deeds are usually styled gifts (q.v.) or voluntary conveyances (q.v.), according to circumstances.

GRATZ, the capital of the crown-land of Styria, in Austria, is a picturesque old t., built on both sides of the Mur, and encircled by fine gardens and pleasure-grounds. It is 140 m. s.s.w. of Vienna, by the Vienna and Trieste railway. The civil population amounts (1869) to 80,732. The inner town, which is connected with the suburb on the western side of the river by two chain and two wooden bridges, is surrounded by walls and by a promenade (formerly the glacis) shaded with trees, has narrow and crooked streets, and is not remarkable for cleanliness. It is worthy of notice, however, from the number of old buildings which it contains, as the cathedral of St. Agidi, built in the 14th c.; the ancient castle of the Styrian dukes, which possesses many curious relics of antiquity; the Landhaus, where the nobles of the duchy held their meetings; the university, founded in 1585, with its library containing 70,000 volumes; its museum, etc., the arsenal, and various palaces belonging to the Styrian nobility. Grätz is well provided with gymnasia and other public educational establishments for the laity, and seminaries for the clergy. As the seat of government for the circle, Grätz has special courts of law and administration, and is a place of considerable importance. It has important manufactures of steel and iron wares, cotton, linen, and woolen fabrics, leather, paper, saltpeter, etc. From its position on the direct line of railway communication between Vienna and Trieste, it is favorably situated as an intermediary station for the trade of the Austrian capital and the Adriatic provinces. Grätz is the residence of a prince-bishop, and has, besides a Protestant church and a synagogue, 23 Catholic churches, some of them very ancient. The country round about Grätz is singularly beautiful and picturesque.

GRAU'DENZ, an old t. and important fortress of Prussia, in the province of west Prussia, stands on the right bank of the Vistula, 60 m. in direct line s. of Dantzic. A bridge of boats, 2,780 ft. in length, here crosses the river. Grätz contains numerous seminaries and educational establishments. It carries on a trade in corn and tobacco, and manufactures of woolens and cottons, etc. The town is fortified by a wall; and about a m. n. of it on a hill, and in a position that commands the course of the Vistula, is the bomb-proof fortress of Graudenz. Pop. '75, 14,553, including the garrison.

GRAU'WACKE. See GRAYWACKE.

GRAVE CREEK. See MOUNDSVILLE.

GRAVEL, the name given to aggregations of water-worn and rounded fragments of rocks, varying in size from a pea to a hen's egg. When the fragments are smaller, the deposit is sand; when larger, it is called shingle. Beds of gravel occur in formations of every age. While the materials have been a long time in being prepared, and have traveled perhaps a great distance from the mother-rock, gravel deposits have been formed speedily and by the action of a strong current of water. They form very irregular and limited deposits, occurring generally as banks or hummocks in strata of sand. Unless in the most recent deposits, they almost always form a hard rock called conglomerate or puddingstone, the pebbles being compacted together by some infiltered current, which is most frequently iron, lime, or silex. Even so recent as the glacial period, gravels are sometimes formed into a compact concrete, though these and later deposits are generally loose. Mr. Prestwich has divided the pleistocene gravels into "High Level" and "Low Level Gravels." The high level gravels are the more ancient; they have been deposited subsequently to the formation of the present valleys, but apparently at a time when there was much more water in the valleys than there is now. The low level gravels have been produced by the present rivers.

GRAVEL. See CALCULUS.

GRAVELINES, a small fortified t. and seaport of France, in the department of Nord, is situated in a marshy locality at the mouth of the Aa, 12 m. s.w. of Dunkerque. Although now a desolate-looking t. with grass growing in its streets, it is of importance in a historical point of view. Here the count d'Egmont obtained a victory over the French army commanded by the Marechal de Thermes in 1558; a victory which compelled the French to accept the severe conditions of the peace of Cateau-Cambrésis. Ten years later, it was taken by Louis XIV., who had it fortified by Vauban. The inhabitants are employed chiefly in the herring and cod fisheries, and the trade in liquors, timber, salt-fish, etc. The harbor has now become useless from neglect. Pop., with garrison, '76, 4,182.

GRAVELOTTE, BATTLE OF, was fought Aug, 18, 1870, in the Franco-German war, near the village of Gravelotte in Alsace-Lorraine. The first and second German armies under gen. Steinmetz and prince Frederick Charles with king William as commander-in-chief, gained a great victory over the French forces under marshal Bazaine. This battle decided the fate of Metz and was probably the bloodiest of the whole war. The Germans numbering 211,000 lost 904 officers and 19,658 men; the French numbering 140,000 lost 609 officers and 11,605 men.

GRAVEL WALLS, made of a conglomeration of cement, or lime, and pebbles and small stones or slag. They are built in casings and the planks may be taken away after the mass has properly hardened. Apertures for doors and windows should be made while the wall is in process of building.

GRAVES, a co. in w. Kentucky on Clark's river, traversed by the Paducah and Memphis railroad; 515 sq.m.; pop. '70, 19,398—2,329 colored. The region is level and the soil productive; chief productions, wheat, corn, tobacco, cotton, and butter. Co. seat, Mayfield.

GRAVE ROBBING. The offense of taking up dead bodies has often been attempted to be declared felony by act of parliament; but it is only a misdemeanor, punishable by fine and imprisonment. If, however, the shroud, coffin, or any property in the nature of a chattel is taken away from the grave, the party may be indicted for felony in stealing these. See ANATOMY (in Law).

GRAVESEND, a market-town, municipal borough, and river-port of England, in the co. of Kent, is situated on the right bank of the Thames, 33 m. w.n.w. of Canterbury, and 24 m. e.s.e. of London by the North Kent Railway. It occupies a somewhat commanding position on the first rising ground after entering the river; and consists of the old town, with narrow, inconvenient, and not too cleanly streets, and of the new town, w. of the older portion, with handsome streets, squares, and terraces. Gravesend is not famous for its architecture. In the vicinity are extensive market-gardens, great part of the produce of which is sent to London. Many of the inhabitants are employed in fishing. Gravesend forms the limit of the port of London. Here pilots and custom-house officers are taken on board of vessels going up the river. For centuries the prosperity of the town has depended on its connection with the metropolis. The salubrious air and beautiful scenery at Gravesend render it a favorite watering-place with Londoners. It carries on some ship-building and a considerable trade in supplying ships' stores. Pop. of municipal borough '71, 21,260; of parliamentary borough, 27,493.

Gravesend was originally a *hythe,* or landing-place, and is mentioned as such in Domesday. Around this landing-place a town grew up soon after the conquest. Here the fleets of the early voyagers, as that of Sebastian Cabot in 1553, and of Martin Frobisher in 1576, used to assemble; and here the lord mayor, aldermen, and city companies were wont to receive all strangers of eminence, and to conduct them up the river in state, forming processions, which, says the historian Froude, were "spectacles scarcely rivaled in gorgeousness by the world-famous weddings of the Adriatic."

GRAVE STONES. The right to grant or refuse permission to erect grave stones, tombs, or monuments in the church or church-yard, in England, is vested in the ordinary, who is generally the bishop. In Scotland, a similar power is vested in the heritors, i.e., the proprietors of the lands in the parish.

GRAVIER, JACQUES, d. 1708; a French missionary in Canada and the wilds of Illinois in the latter part of the 17th century. He continued the work of Marquette among the Indians for several years, but was constantly opposed by the medicine men who found their craft in danger. At length they gave him a wound from which he never recovered. During his labors he went down the Mississippi twice to see Iberville, the Louisiana pioneer. He sailed for Europe in 1706, and returned in 1708. He wrote three works on the Indian missions and Louisiana affairs, and compiled a grammar of the Illinois tongue.

GRAVINA, a commercial and industrious episcopal t. in the s. of Italy, in the province of Bari, is situated on a hill above the left bank of a stream of the same name, 37 m. s.w. of the town of Bari. It contains (1872) 14,194 inhabitants, and occupies the site of ancient *Blera,* one of the stations on the Via Appia, which passed at Poggio Orsino, about a mile from the town. In 995 it sustained a memorable siege against the Saracens. It was a favorite hunting-place of the emperor Frederick II. The neighborhood possesses rich pastures, and raises a celebrated breed of horses, in which the inhabitants do a large trade at their annual cattle-fair.

GRAVITA, an Italian term used in music, signifying that it is to be performed with an earnest and dignified expression, while the movement progresses in a slow, marked, and solemn time.

GRAVITATION—GRAVITY. All bodies, when raised into the air, and left unsupported, fall to the earth in lines perpendicular to it. The force which causes them to do so is termed gravity, and, universal experience shows, acts towards the earth's center; more strictly, it acts perpendicularly to the surface of still water. But if a body, as a stone, be projected obliquely into the air, it is made to describe a curved path, having a highest point, vertex, or apogee; and when it meets the earth in its descent, its direction is not towards the center, but inclined to it at the angle of projection. See PROJECTILES. Observing this, and that the body, if not interrupted by the earth's surface, would continue to move in a curve, with its tangent always away from the center, it is easy to imagine that if not interrupted, it might circulate round the center as the moon does round the earth. Next, knowing that the force of gravity is exerted at all accessible heights above the earth, the question arises—May it not be exerted as far off as the moon? which we know to influenced by *some* force which continually deflects her from the tangent to her orbit, and makes her circulate round the earth. See CENTRAL FORCES. Observing now the time of revolution of the moon, and calculating its centrifugal force, which we know must equal the centripetal force, we put the question: Is this force the same as gravity? The answer is, that it is a force

3,600 times less energetic. If, then, gravity be the force which really holds the moon to her path, it must be explained why it acts upon her so much more feebly than it would, were she a body on the earth's surface. The explanation is given at once if we suppose gravity to be a force whose energy diminishes with increase of distance, and is inversely as the squares of the distances at which it is exerted, for the distance of the moon from the earth's center is just about 60 times that of the earth's surface from its center, and $3,600 : 1 :: 60^2 : 1$. We infer that it does so from the fact, that there is nothing inadmissible in such a diminution of energy with increase of distance—that, on the contrary, there are many analogies for it, as in the emanations of light and heat; and in the argument drawn from the necessity of otherwise supposing some other force than gravity to be employed in deflecting the moon, and the force of gravity to cease at some unknown level. On these views, and a generalization to be afterwards mentioned, Newton is understood to have at first rested his law of universal gravitation: "Every particle of matter in the universe attracts every other particle with a force directly proportioned to the mass of the attracting particle, and inversely to the square of the distance between them"—a law, the truth of which, since it was first broached, has been put beyond all question by the most complete body of predictions, fulfilled to the letter, that can be cited in support of any law of nature.

Before, however, the argument on the extension of terrestrial gravity to the sphere of the moon could have become pregnant with so great a result, much investigation had to take place in other fields; and, in fact, Newton had, previously to conceiving the law, explained the three great Keplerian laws of order obtaining in the solar system by reference to an attractive force residing in the sun. These laws are—1. That the planets revolve round the sun in ellipses, having the sun for a common focus: 2. That every planet moves in such a way that the line drawn from it to the sun sweeps over equal areas in equal times: 3. That the squares of the times occupied by the several planets in their revolutions in their elliptic orbits, are proportional to the cubes of their mean distances from their common focus, the sun. From the law of equal areas, Newton inferred that every planet is retained in its orbit by a force of attraction directed towards the center of the sun; from the orbits being elliptical, he inferred that in each case this force varies in intensity according to the inverse square of the body's distance from the sun; while from the third law he inferred the homogeneity of the central force throughout the solar system. It was then, after being familiar with the notion of terrestrial gravity, and its action, through the researches of Galileo, Huyghens, and Hooke, and with the notion of a central force acting inversely as the square of the distance of its object, through his explanations of the laws of Kepler, that he put to himself the question: Is not the force with which the moon gravitates to the earth the same with gravity?—the force which causes a stone to fall on its surface. A question answered affirmatively on the supposition of gravity, like the sun's attraction, being a force diminishing with increase of distance, and according to the same law. The result was to bring the whole solar system, the planets and the sun, and satellites and their planets—the satellites being observed to obey the same laws of order with reference to their primaries that the latter obeyed in reference to the sun—under the law of gravitation. And the imagination lifted up by the grandeur of the conception, would refuse to limit the operation of that law to our own system, were there no facts to entitle us to extend it beyond. The phenomena of double stars, however, of themselves justify the extension and the statement of the law as we have given it in universal terms. It may be observed, in conclusion, that the Keplerian laws, which may be said to have been the basis of Newton's researches, are, owing to perturbations caused by the mutual action of the planets, etc., only approximately correct; and that these perturbations afford, when examined, a further proof of the truth and universality of the law of gravitation.

For a notice of speculations as to the nature of the law of gravitation, see FORCE; see also FALLING BODIES, PROJECTILES, etc.

GRAVITY, SPECIFIC. See SPECIFIC GRAVITY.

GRAY, a small t. of France, in the department of Haute-Saône, is situated on the slope of a hill overlooking a beautiful meadow, on the left bank of the Saône, 26 m. w.n.w. of the Besançon. It is commanded by the remains of an ancient castle, the residence in former times of the dukes of Burgundy, and has a pleasing appearance from a distance, although its streets are crooked, narrow, and steep. Gray is an important entrepôt for goods from the north-eastern districts of France, which are conveyed by the Saône to the south. Its trade is chiefly in corn, flour, timber, wine, iron, and colonial produce. Pop. '76, 7,345.

GRAY, ASA, an eminent American botanist, b. at Paris, Oneida co., N. Y., Nov. 18, 1810. He took his degree of M.D. in 1831, but soon relinquishing the practice of medicine, he devoted himself, under prof. Torrey, to his favorite study of botany. In 1834 he received the appointment of botanist of the United States' exploring expedition; but as a long delay took place before it was ready to sail, he resigned his post in 1837. He was afterwards appointed prof. of botany in the university of Michigan; but before he had entered upon the duties of that office he was elected, in 1842, Fisher prof. of natural history at Harvard university, Cambridge, Mass. In addition to his prelections at Cambridge, prof. Gray has delivered some courses of lectures at the Lowell institute, in Bos-

ton. He ranks among the leading botanists, not only of America, but of the age. In his numerous writings he has shown equal ability in communicating elementary knowledge and in elucidating recondite theories. He came forward at a time when the old artificial systems of botany were giving way to the natural system which has taken their place, and he was the first in America, in conjunction with Dr. Torrey, who arranged the heterogeneous assemblage of species upon the natural basis of affinity. In 1836 he published his *Elements of Botany*, afterwards enlarged into the *Botanical Text-book;* and in 1838 he commenced, with Dr. Torrey, the *Flora of North America*, to be completed in three large volumes, but still unfinished. In 1848, appeared the *Manual of Botany for the Northern United States*, and the first volume of the *Genera Borealia Americana Illustrata*, of which another volume has since been issued. Among his remaining works may be mentioned: *Botany of the United States' Pacific Exploring Expedition, under Captain Wilkie* (1854–58); *How Plants Grow; Lessons in Botany; Structural and Systematic Botany;* a revised edition of the *Botanical Text-book*, with 1300 illustrations; *Flora of the Southern United States; School and Field Book of Botany* (1869); and *Botany for Young People* (1869). Prof. Gray has also contributed many papers to scientific periodicals and the transactions of learned societies.

GRAY, DAVID, 1838–61; a poet of Scotland, the son of a poor weaver. David managed to get into Glasgow university, and acquired a fair education. He was for a time private tutor. In 1860 he went to London, where from motives of economy he slept the first night in a park and laid the foundation of the disease from which he died. He had written *The Luggie*, an intensely Scotch poem; but no one felt inclined to read it. Finally Monkton Milnes took pity on him and tried to get the poem into Thackeray's magazine, but the editor rejected it. The sick and disappointed author was sent home by Milnes, and the day before he died he had the satisfaction of seeing a proof-sheet of the first pages of his *Luggie*, which, through Sidney Dobell's influence, had found a publisher. The work, including other poems, was published in London in 1862.

GRAY, FRANCIS CALLEY, LL.D., 1790–1856; b. Mass.; graduated at Harvard, and became a lawyer. When John Quincy Adams was envoy to Russia, Gray was his private secretary. He was a member of the Massachusetts legislature. He took great interest in science, and was secretary of the academy of arts and sciences. In his will he left $50,000 for a museum of comparative zoology to be a part of Harvard university, besides an investment to secure care of the museum and publication of catalogues and illustrations. In 1848 he published *Prison Discipline*, and from time to time contributed many papers to the *North American Review*.

GRAY, GEORGE ROBERT, b. England, 1808; brother of John Edward (*ante*), and also a naturalist. He was 28 years in the zoological department of the British museum, and has written many papers and some books on natural history, among them the article on entomology in Cuvier's *Animal Kingdom*, *List of the Genera of Birds*, and two others also on birds. His list embraces over 2,900 genera and 11,660 species.

GRAY, HENRY PETERS, 1819–79; b. New York; studied painting with Huntington, and in 1839 traveled in Europe. While there he produced "Thou art Gone;" "The Billet Doux;" and "The Roman Girl." He returned in 1843, but was again in Europe in 1845–46, when he painted "Teaching a Child to Pray;" "Proserpine and Bacchus;" and other works. Some of his more important pictures are "Wages of War;" "Apple of Discord;" "Portia and Bassanio;" "Cleopatra;" "Origin of the American Flag;" and "Genevieve." In 1871 he went to Europe where he remained several years, after which he returned to New York, where he died.

GRAY, JOHN EDWARD, naturalist, b. at Walsall in the year 1800, was educated for the medical profession. In 1821 he assisted his father (who was author of *Supplement to the Pharmacopœia*, and other works) in the preparation of his *Natural Arrangement of British Plants*, in which, for the first time in the English language, the new method was adopted. In 1824 he entered the British museum as assistant in the natural history department, where he found scope for the employment of his extensive knowledge and accuracy of observation, and in 1840 was appointed keeper of the zoological collections. This important post he retained till his death, to the manifest advantage of zoological science, for the British museum collections are the most complete in the world: a monument of his persevering activity throughout an active life. His success was partly due to his quickness in seizing the peculiar characteristic of animal forms, which rendered him a good classifier. The royal Bavarian academy of sciences at Munich recognized his services to science by conferring on him the title of PH.D. Dr. Gray wrote much on subjects connected with his department. The mere titles of his books and papers make a long list, numbering more than 500. His zoological and natural history catalogues are not mere lists, but are enriched with synonyms and ample notes, whereby study of particular subjects is greatly promoted. Dr. Gray did not confine his activity to his special department: he assisted in the formation of some of the most prosperous scientific societies of London: and he was a vice-president of the zoological society, and took an active part in its management. He, moreover, claimed to have anticipated sir Rowland Hill in his proposal for a low uniform rate of postage. He, at various times, gave valuable evidence before parliamentary committees, on the management of the

British museum and other subjects; and he served on the juries of the great exhibitions of 1851 and 1862. Dr. Gray died at his residence in the British museum, in 1875.

Dr. Gray's principal works are: *Illustrations of Indian Zoology*, 2. vols. folio; *The Knowsley Menagerie*, 2 vols. folio; *Spicilegia Zoologica—on Mammalia, Birds, Reptiles, Fishes, Mollusca, Shells;* a *Synopsis of the Contents of the British Museum;* besides catalogues of the specimens in the zoological department, which have greatly facilitated the study of those collections. He also wrote many scientific papers, which have been published in the *Philosophical Transactions*, the *Transactions of the Linnæan Society*, the *Encyclopædia Metropolitana*, *Annals of Natural History*, and the *Reports of the British Association;* the whole comprising a mass of facts and principles highly valuable to naturalists.

In 1826 Dr, Gray married a lady who rendered him important aid in his studies, and is known as authoress of *Figures of Molluscous Animals, for the Use of Students*, a work in five volumes. In 1832 he was elected a fellow of the royal society, and afterwards served on the council. He was a member of some of the principal societies and academies in England and on the continent.—His late brother, GEORGE R. GRAY, who was an officer in the zoological department of the British museum from 1831 till his death in 1872, was the author of many memoirs on zoology, but is best known as author of *The Genera of Birds.*

GRAY, ROBERT, 1755–1806; b. R. I. He was the first to carry the American flag around the world, which he did in 1790–91 in the sloop Washington on a trading voyage to the n.w. coast of America and on to China and the west. On another voyage in 1791 he discovered the Columbia river (in Oregon).

GRAY, THOMAS, an English poet, was b. in London Dec. 26, 1716. His father, Philip Gray, a money-scrivener, was of a disposition so violent, that his wife was obliged to separate from him; and it was mainly through her exertions that her son was placed at Eton, and afterwards at Cambridge. At Eton he made the acquaintance of Horace Walpole, the son of the prime minister; and when his college education was completed, he accompanied his friend on a tour through France and Italy. After spending a year in the search of the picturesque and in the exploration of picture-galleries, the friends quarreled, and Gray returned to England, and went to Cambridge to take his degree in civil law. At the university the greater portion of his life was spent breathing the serene air of noble libraries, and corresponding with friends, as only the men of that day could correspond. In 1756, in consequence of a practical joke, he removed from St. Peter's college to Pembroke hall. He had a just appreciation of the natural beauty of his native country, and rambled in Scotland, Wales, and the English lake counties. He made notes wherever he went, and wrote copious descriptions of what he had seen to his literary friends. He published his *Ode to Eton College* in 1747, and his *Elegy written in a Country Churchyard* two years afterwards. His *Pindaric Odes* appeared in 1757; but however much they might dazzle the imagination with brilliant imagery, and charm the ear with involved and intricate harmony, they did not touch the popular heart like the *Elegy*. On the death of Colley Cibber, he was offered, but declined, the post of poet-laureate. Shortly after, he was appointed professor of modern history. Fastidious in his tastes, fond of books and lettered ease, indisposed to mingle in the great world, but delighting to comment upon it in letters to friends, blessed with a reputation peculiarly dear to a scholar's heart, comparatively rich, his life glided on imbittered but by one enemy—gout. Dining one day in the college hall, he was severely attacked, and after suffering a week, he died July 30, 1771, aged 55 years. He was buried by the side of his mother at Stokes near Eton.

The poetry of Gray, with the exception of the *Elegy*—which everybody knows—has never become popular; yet in its own sphere it is very perfect; delicately if not richly imaginative, curiously studded with imagery; exquisitely finished, like miniatures painted on ivory. But his subjects are often remote, and out of the track of ordinary human feelings.

GRAY, in heraldry, signifies a badger.

GRAY, WILLIAM, 1750–1825; b. Mass.; for many years one of the foremost of Boston merchants, a man of little education but of remarkable natural abilities. At one time he had more than two score large vessels engaged in ocean trade. He was a member of the state senate, and for one term lieutenant-governor. Many anecdotes are current of his oddities and his utter indifference to the personal pride that usually accompanies great wealth.

GRAYLING (*thymallus vulgaris*), a fish of the family *salmonidæ*, and of a genus distinguished from salmon, trout, etc., by smaller mouth and much smaller teeth, and by the greater size of the dorsal fin. The scales are also much larger. The grayling is found in many streams in England, but is, however, very local; and of two rivers in the same neighborhood, one often contains it, and the other does not. A supposition that it was brought to England by the monks, is unsupported by any evidence. It is found in the Eden and the Esk in Cumberland, in the Clyde in Lanarkshire, and in the Orkney islands. It is plentiful in many parts of Europe, and equally in Switzerland and in Lapland. It inhabits clear streams, with rocky or gravelly bottoms, and "seems

to require an alteration of stream and pool." It will live in clean newly-made ponds in hard soil, although it does not breed in them, but will not live in those of muddy bottom. Its food consists chiefly of flies and aquatic larvæ, and it is taken by angling in the same manner as the trout. It sometimes attains the weight of 4 or 5 lbs. The back and sides are silvery gray, marked with numerous longitudinal dusky streaks; the dorsal fin is spotted, the spots arranged in lines across the fin. The abdominal line is almost straight, the dorsal line is considerably elevated. The grayling is greatly esteemed for the table, but requires to be cooked when newly caught, when it has an odor which has been compared to that of wild thyme. It spawns in April or May, and is in the best condition when trout are out of season, in Oct. and Nov.—There are several other species of *thymallus*, none of which are British. One of them, *T. signifer*, a very beautiful fish, inhabiting the clear affluents of the Mackenzie river, is called *hewlukpowak*, or the *fish with the winglike fin*, by the Esquimaux. It is said to afford excellent sport to the angler; although the streams in which it is found are visited by few anglers for mere amusement.

This beautiful fish is very local in its distribution, but is abundant in most of the Scandinavian rivers. Angling for grayling is excellent sport. It rises to the same flies as those which are used for trout: it also takes worms, maggots, and other small larvæ and insects. From July to the end of Oct. are the best months for grayling fishing, but in fine open days they afford sport through the winter.

GRAY'S INN, one of the four inns of court having the sole power of calling persons to the degree of barrister-at-law. See INNS OF COURT.

GRAYSON, a co. in w. central Kentucky, drained by head waters of Green river, and crossed by the Louisville, Paducah and Southern railroad; 650 sq.m.; pop. '70, 11,580—407 colored. The surface is nearly level with tolerably fertile soil. Chief productions, corn, tobacco, and pork. Limestone is found in abundance. Co. seat, Leitchfield.

GRAYSON, a co. in n. Texas on Red and Trinity rivers, intersected by the Houston and Texas Central railroad; 950 sq.m.; pop. '70, 14,387—2,145 colored. It has an undulating surface in part covered with forests of ash, oak, etc. The soil is fertile; chief productions, corn, cotton, oats, cattle, and pork. Co. seat, Sherman.

GRAYSON, WILLIAM, b. Va.; d. 1790. He was educated at Oxford (Eng.) and in law in the temple in London. Migrating to Virginia, he became one of Washington's aids; subsequently commanded a Virginian regiment, and was on various commissions with regard to prisoners. He was in the Virginia convention to consider the federal constitution and (with Patrick Henry and others) vigorously opposed its adoption. He was one of the first U. S. senators from the state.

GRAYSON, a co in s.w. Virginia, on the North Carolina border; intersected by the Kanawha river; 400 sq.m.; pop. '70, 9,587—754 colored. The surface is hilly and about one-half is occupied by forests. The main productions are wheat, rye, corn, butter, wool, and cattle. Co. seat, Independence.

GRAY'S PEAK, one of the Rocky mountains in Colorado about 12 m. w. of Georgetown. Its height is 14,466 feet. It was named after prof. Asa Gray, the botanist. Not far away is Torrey's peak of almost the same height, named from prof. John Torrey, the botanist.

GRAZALE'MA, a small t. of Spain, in the province of Cadiz, and situated about 60 m. e.n.e. of the city of that name in a strong position on a rocky hill approachable only by a narrow and easily defended ledge, between the Sierra de Ronda on the e., and the Cerro de S. Cristoval on the west. It was compared by the French (a whole division of whom was here repulsed by the inhabitants) to a land Gibraltar. A great deal of smuggling, and, it is suspected, robbery, is carried on by the inhabitants. Pop. 5,000.

GRAZIO'SO, an Italian term in music, meaning with graceful expression.

GREASE, a term of general application to all oily or fatty matters, but generally to those having some degree of solidity, as tallow. It is more specially applied to fatty matters which are so deteriorated with dirt or other impurities as to be unfit for candle-making and other manufactures requiring some degree of purity in the material. Grease is largely employed as a lubricant for machinery, and especially for the wheels of carriages. The grease employed for the axles of carriages and carts consists of the most inferior kinds of grease mixed with a little tar.

In commerce, the term mares' grease is now well known. It is the fat of horses which are killed in large numbers at Buenos Ayres and Montevideo; and their products, consisting of hides, grease, bones, and hair, are largely exported to this and other countries. Owing to the practice of slaughtering the mares chiefly, this particular kind of fat has been designated *mares' grease*. It is a very oily fat, and so penetrating, that it is difficult to make casks sufficiently tight to prevent leakage. It is used for lubricating machinery, for which it is well adapted.

RAILWAY GREASE is, in reality, a kind of soap, a small portion of soda being mingled with the materials to effect an imperfect saponification. The object is to prevent the

too rapid melting of the material, which, without this precaution, would be excessively rapid, owing to the heat caused by the friction of wheels revolving with such rapidity. It is also made of very superior materials, and consists generally of the vegetable fats called cocoa-nut oil and palm-oil; sometimes animal fat is used. This composition is placed in small metal boxes on the axles, with which they communicate by a small hole, so that, as the axle heats the surrounding parts, the grease in the boxes melts, and runs through the little orifice on to the axle. See BEARS, GREACE.

GREASE. Various kinds of tallow, fat, dripping, and kitchen-stuff receive the general name of grease, as applied to several manufacturing processes; but the name is now more technically given to the lubricating unguent employed for the rolling-stock of railway companies. While oil is the lubricator for the delicate parts of the locomotive, grease is necessary for the axles of the wheels. So vast is the quantity used, that the annual demand amounts to thousands of tons; and, as the quality is very important, most of the great companies make their own—establishing a marked distinction between the two kinds used for locomotives and for wagons.

Locomotive grease usually consists of tallow, oil, carbonate of soda, and water. Much depends on the consistency. If the grease is too thick, the axle-boxes become hot; if too thin, it is used up too quickly. Again, if there is too much alkali, there is a residue left in the boxes; if too little, the grease is too soft and wasteful. The grease is always yellow; but it is made of a thinner consistency for cold weather than for hot. The following are given as the constituents of two kinds that meet with approval, to produce one ton of each kind of grease, allowing a certain percentage for waste:

	WINTER.			SUMMER.		
	cwts.	qrs.	lbs.	cwts.	qrs.	lbs.
Tallow	3	3	0	4	2	0
Palm-oil	2	2	0	2	2	0
Sperm-oil	0	1	7	0	0	27
Alkali	1	0	14	1	0	8
Water	12	3	12	13	0	26

The manufacture is very simple. The tallow and oils are heated to 180° F.; the water and alkali to 200°; both are run off into wooden tubs, where they are well stirred till cold, with special precautions against the admission of any grit or dirt.

Wagon grease is coarser and cheaper in quality. The ingredients are chiefly some kind of resinous oil and caustic lime. When resin was cheap, wagon grease cost about half the price of locomotive grease, and was useful not only for wagon and carriage axles, but also for low-speed goods and mineral locomotives; but during the American war, the price of resin rose, and then attempts were made to use residues from paraffine, coal-tar, candle-making, cotton-seed oil, fish-oil, pitch-oil, and other substitutes.

It is said that 3,000 tons of grease are made every year in the Tyne district, not exactly as a primary product, but as using up a residue from the distillation of resin.

GREASE-WOOD, a plant growing profusely in the w. portion of the United States. Its botanical name is *sarcobatus vermiculatus*. It is most prolific on barren and alkaline soils.

GREAT BARRINGTON, a t. in Berkshire co., Mass., on the Housatonic river and railroad, 40 m. s.s.e. of Albany, N. Y., in the midst of a picturesque region; pop. '80, 4,658. There is water power, and a number of important manufactures. Beds of iron ore and marble are found in the township. Its schools are numerous and excellent. The new town hall is a fine building, before which is a fine statue of Victory for the soldiers' monument. In the vicinity is a curious rock formation called purgatory.

GREAT BASIN, or FREMONT'S BASIN, a remarkable tract of country in North America, lying in the w. of Utah territory, and bounded on the w. by the Sierra de Nevada, and on the e. by the Wahsatch mountains. It is said to be 500 m. in extent from e. to w. and about 350 from n. to s.; is girdled round on every side by high mountains, while detached groups cross its whole area; and lies at an elevation of about 5,000 ft. above sea-level. The Humboldt river mountains, with an elevation of from 5,000 to 7,000 ft. above the surrounding country, traverse the plateau near its center. This basin contains many lakes and rivers whose waters never reach the ocean, but are either taken up by evaporation, or are lost in the more arid districts. The Great Basin is essentially a desert. Some portions of it are covered by a yielding mass composed of sand, salt, and clay; others by a crust of alkaline and saline substance.

GREAT BEAR LAKE. See BEAR LAKE, GREAT.

GREAT BRITAIN. Under this head are noticed—1. The island of Great Britain—its geology and geography; 2. The United Kingdom of Great Britain and Ireland—its general statistics, etc. Historical sketches of England and Scotland down to the union of the two kingdoms are given under their respective names; the history of Ireland to its union with Great Britain is also given under its own name, together with its geography.

The ISLAND OF GREAT BRITAIN—so called to distinguish it from Britannia Minor, or Little Britain (see BRETAGNE) in France—lies between lat. 49° 57′ 30″ and 58° 40′

24° n., and between long. 1° 46' e. and 6° 13' w., and is the largest island in Europe. It is bounded on the n. by the Atlantic, on the e. by the North sea, on the s. by the English channel, and on the w. by the Atlantic, the Irish sea, and St. George's channel. The most northerly point is Dunnet head, in Caithness; the most southerly, Lizard point, in Cornwall; the most easterly, Lowestoft Ness, in Suffolk; and the most westerly, Ardnamurchan point, in Argyleshire. Its greatest length is about 608 m., and its greatest breadth (from Land's End to the e. coast of Kent) about 320 m.; while its surface contains about 89,600 sq. miles.

Geology.—The geology of Great Britain is of peculiar importance. The rocks of the earth's crust having been first systematically studied and expounded here, British geologists have given to the world the names whereby the various strata are known, and British rocks form the typical series of the earth's strata. The whole recognized series of stratified deposits occur in Britain, one or two only being more fully developed elsewhere; and it is only in these singular cases that the foreign equivalents are taken as the types. British geology is no less important from the influence it has had in the development of the country. The mineral wealth, especially the coal and the iron, are the real sinews and muscles of Britain's mighty power. No other country has similar advantages in such an area.

We shall, in this sketch of the distribution of the British rocks, follow the order of the strata, beginning with the lowest and oldest. It may be said that, in general, the mountainous regions of the n. and w. are formed of the oldest sedimentary rocks, and that, as we move south-eastwards, we gradually pass over newer strata, until, in the e. of England, we come to the only extensive Pleistocene deposits in the country.

The base rocks of the whole series occur in the outer Hebrides, in Tiree and Coll, and along the western shores of Sutherland and Ross. The true position of these strata has been only recently determined by Murchison and Geikie, who, noticing that their strike was at right angles to the beds resting above them, discovered that they were older than the superimposed Cambrian rocks. They consider them to be the equivalents of the *Laurentian system*, described by sir W. Logan in Canada. The predominant rock is crystalline gneiss. A band of limestone occurs on the n.e. shore of loch Maree, but this has hitherto proved unfossiliferous.

Resting on the convoluted edges of this old gneiss, on the mainland, and forming the basement rocks in Cumberland, Anglesey, and North Wales, we have the *Cambrian series* of deposits. In Scotland, these rocks are brownish-red sandstones and conglomerates; in England and Wales, they are composed of sandstones, gritstones, and slates. A few fossils, chiefly impressions of supposed fucoid plants, annelid tracks, and zoophytes, have been found in the slates.

The *Silurian measures* occupy a large portion of the surface of the country. The typical rocks occur in Wales, extending over the western portion of the principality from Pembroke to Denbigh, and including the northern portions of Pembroke, Caermarthen, and Brecknock, the whole of Radnor and Montgomery, the s.w. of Denbigh, and the whole of the counties to the west. The oldest or lower silurian beds are next the coast. The series consists of an immense thickness of shales, slates, and sandstones, with intercalated limestones more or less pure. Immense tracts have hitherto proved devoid of fossils; in other districts, the calcareous rocks are almost entirely composed of the remains of marine invertebrate animals, while the shales abound in zoophytes and crustacea. The high lands in the n. of Lancashire and s. of Westmoreland are silurian; but it is in Scotland where these strata are most extensively developed; indeed, almost the whole country consists of silurian strata, with the exception of a large trough in the center, occupied with newer rocks. A line drawn from Dunbar to Girvan forms the northern limit of these beds in the s. of Scotland. Except the lower half of the valley of the Tweed, the whole region from this line to near the base of the Cheviots is silurian. The rocks are chiefly graywacke, with scattered beds of impure limestone. The chief fossils are graptolites, crustacea, and mollusca. The lead-mines of Wanlockhead and Leadhills are in this district. A line drawn from Stonehaven to Helensburgh would mark the termination of the silurian strata, which compose the whole of the n. of Scotland, with the exception of the newer beds on the n.e. coast, and the Laurentian and Cambrian series already described. All the series is greatly metamorphosed; the lower strata are converted into quartzose flagstones and quartz rock, the upper into chlorite and mica-slate, and quartzose and gneissose rocks.

The *old red sandstone strata*, consisting of conglomerates, coarse and fine grained sandstones, and dark-colored schists, with the characteristic fossils of ganoid and placoid fish, overlie the silurians in several districts in Scotland. Nearly all Caithness and the seaward portions of Sutherland, Ross, Cromarty, Inverness, Nairn, and Moray, belong to these strata. A broad band, rising on the e. coast between Stonehaven and St. Andrews, stretches across the country to Helensburgh and Dumbarton on the west. The same strata appear again in Haddington, Berwick, and Roxburgh, in Lanark, and in Ayrshire. An extensive tract of these strata occurs in South Wales and the neighboring English counties, extending from the Silurian district to the Severn and the Bristol channel, and containing in a large basin the South Wales coal-field. The highly fossiliferous strata of North Devon, and of South Devon and Cornwall, belong to this

period. They consist of slates, sandstones, and limestones, and contain numerous corals and shell-fish.

The strata of the *carboniferous period* may be said to occupy a broad tract extending from the Bristol channel to the base of the Cheviots. They are not continuous between these limits, but are broken up in some places by the appearance on the surface of older strata, while in others they are covered by newer deposits. The various detached coal-fields are—(1) the South Wales, in Glamorgan and Pembroke; (2) the Bristol, and (3) the Forest of Dean, in Gloucester; (4) the Forest of Wyre, in Worcester; (5) Shrewsbury, and (6) Colebrook Dale, in Shropshire; (7) North and (8) South Staffordshire; (9) Warwickshire; (10) Leicestershire; (11) Flint and Denbigh; (12) Lancashire; (13) York and Derby; (14) Cumberland; and (15) Northumberland and Durham. In the northern portion of this great tract of coal measures, where the millstone grit and carboniferous limestone are largely developed, no seams of coal of any value are contained. The limestone in Derby is rich in metallic ores. The carboniferous strata of the n. of England extend beyond the Cheviots into Scotland, forming a narrow band from the Solway to the North sea, in the counties of Dumfries, Roxburgh, and Berwick. The only coal-field in this district is one of small extent at Canonbie, in Dumfriesshire. The carboniferous strata in Scotland, with the exception just stated, are confined to the immense trough between the Silurian measures on the s. and the old red sandstone on the n., which is completely occupied by them, except where the old red sandstone rises to the surface. Considerable tracts of sandstone and limestone without coal break up the true coal-bearing measures into the following coal-fields: the Mid-Lothian, the Fife, the Lanark and Stirling, and the Old Cumnock, in Ayrshire. Besides coal, the whole of the carboniferous series contain immense stores of argillaceous carbonate of iron, the ore from which is produced the great bulk of the iron used in the country. The sandstones of this period form beautiful and durable building-stones, the limestones are of great commercial value, and many of the less indurated shales are good fireclays.

Permian strata, consisting of magnesian limestone and sandstone colored with oxide of iron, occupy a considerable area in Durham, and border the carboniferous rocks in Dumfries, Cumberland, Westmoreland, Lancashire, Cheshire, Shropshire, Stafford, Worcester, Warwick, Nottingham, and York, and in Glamorgan. The sandstone is quarried for building.

The typical triple series of the *Triassic measures* occur in Germany; the British representatives consist of variously colored sandstones and marls. They occupy a considerable surface in Lancashire, Cheshire, Shropshire, and Stafford, and extend as a ribbon of varying breadth, from the mouth of the Exe, through Devon, Somerset, Gloucester, Worcester, Warwick, Leicester, Nottingham, York, and Durham, to the coast of Hartlepool. The only deposits of rock-salt in Britain occur in the triassic rocks of Cheshire and Worcestershire.

The *Lias* consists of white sandstones, limestones, shales, marls, and alum slates. They abound in fossils, especially in the remains of reptiles, fishes, mollusca, and encrinites. The strata of this age occupy a band between the Trias and the Oolite, extending from Lyme Regis to the mouth of the Tees. Two small tracts of lias occur, the one in Glamorgan, and the other in Shropshire. In Scotland, small patches exist at Brora in Sutherland, and in the islands of Skye, Eigg, and Mull.

The *Oolite measures* are composed of an extensive series of limestones, sandstones, and shales, which occupy a belt of nearly 30 m. broad, from Yorkshire to Dorsetshire, passing through Lincoln, Northampton, Huntingdon, Bedford, Buckingham, Oxford, and Wilts. The best building materials in England are obtained from these strata. oolite strata occur in Scotland at Brora and in Skye. In the Brora oolite, a seam of coal $3\frac{1}{2}$ ft. in thickness has been worked for upwards of a century. It is the thickest bed of pure vegetable matter detected in any secondary formation in Britain.

The fresh-water *Wealden series*, with their abundant remains of reptiles, fishes, shells, and insects, occur in Kent and Sussex, in the isle of Wight, and in the s. of Devon.

The beds of the *Cretaceous period*, consisting chiefly of chalk with intercalated sands and clays, all very rich in fossil remains, occupy a broad tract to the e. of the oolite strata, and parallel to them. Beginning a little n. of Flamborough Head, they may be traced through York and Lincoln, then across the Wash into Norfolk, Suffolk, Hertford, Buckingham, Oxford, Berks, to Hampshire, where they separate into three arms, the one extending south-westward through Wilts and Dorset to the s. coast; another taking a s.e. direction to Beachy Head; and the third stretches as a narrow band in an easterly direction through Surrey and North Kent, widening out as it nears the coast, where it occupies the district between Ramsgate and Folkestone.

Eocene strata, consisting of clays, sands, and marls, abounding in fossils which apparently indicate a sub-tropical climate, occupy the valley of the Thames, from Hungerford to the sea, and from Canterbury to Saxmundham, as well as a large district in Dorset, Hants, and Sussex, from Salisbury w. to Dorchester, and e. almost to Hastings.

Unless the beds in Mull, containing the numerous impressions of leaves of exogenous plants, are *miocene strata*, there are no representatives of this period in Britain.

The *Pliocene deposits* of ferruginous shelly sand and marl known as red crag occur chiefly in Suffolk. The still more recent *pleistocene deposits* of fresh-water sand and gravel, and mammaliferous crag, are found on the coasts of Norfolk, Suffolk, Essex,

and Kent. The till and glacial beds of the same age are scattered as superficial deposits over large districts in Britain. Fossiliferous beds of this age occur in Caithness, in the valley of the Clyde, and in Lancashire; they contain remains of mollusca, many of which still live in the seas of boreal America.

Minerals—Coal.—From the collieries in Britain in 1876 were raised 133,344,766 tons of coal. The greatly increasing consumption of coal has originated fears as to the possibility of the exhaustion of our mineral fuel. It appears that, while in 1820, only 15,000 000 tons were raised, in 1840 the amount had reached 30,000,000, and in 1860 it was nearly 84,000,000. At the same rate of increase, the known coal, within a workable distance from the surface, would last at least 100 years. But the consumption, during the last 20 years of the century, would, at the present increasing ratio, amount to 1464 million tons a year, a quantity vastly greater than can possibly be used. We need not, therefore, now begin to fear lest our coal-fields should be speedily used up.

Iron.—Formerly, the only iron produced in the country was obtained from the greensand of the s.e. of England, and from the brown hematite of the Dean forest. The ore was smelted with charcoal. But the introduction of coke and coal for smelting, and the discovery of numerous additional and unthought-of deposits, especially in connection with coal-bearing strata, has immensely increased the production of iron, and met the greatly increased demands for this important metal. In 1760, when charcoal alone was used for smelting, not more than 25,000 tons of iron were produced; while in 1860, no less than 3,826,752 tons were obtained from 8,024,206 tons of ore. The market value of the metal was £12,703,950. In 1876 the total iron ore production of the United Kingdom, of which returns were received, amounted to 16,841,583 tons, of the value of £6,825,705. The most important ore is the ferruginous shale, or impure argillaceous carbonate of iron, which occurs in connection with every coal-field in Britain. The brown and red hematite, associated with the oldest paleozoic rocks, yield also a large amount of metallic iron.

Tin is obtained from only two counties—Cornwall and Devon. In 1876 the produce was 8,500 tons of metallic tin, worth £675,750.

Copper is principally obtained from the same two counties. There are about 101 different mines, which produced, in 1876, 79,252 tons of ore, yielding 4,694 tons of metallic copper, worth £392,300. In 1860 there was a yield of 13,789 tons of ore, producing 935 tons of metal, worth £100,691, chiefly from the counties of Lancaster, Caermarthen, and Anglesey, very small quantities being supplied from Cumberland, Chester, Cardigan, and the isle of Man.

Lead and *silver* are obtained from the same ore from numerous mines in palæozoic districts. The most productive English mines are in Northumberland, Durham, Cumberland, York, and Derby, in Shropshire, and in Cornwall and Devon. Small quantities are obtained in Somerset, Westmoreland, Stafford, and Chester. All the Silurian counties of Wales contain mines. The isle of Man yields nearly 3,000 tons of ore. In Scotland, the most productive mines are at Wanlockhead and Leadhills; Argyle, Perth, and Kirkcudbright also supply small quanties. The total amount of ore raised in 1876 was 79,096 tons, yielding 58,667 tons of metal, worth £1,270,415. From this there were separated 483,422 ounces of silver, worth £106,222.

Zinc is obtained from Cornwall and Devon, Cardigan and North Wales, Derby, Cumberland, and the isle of Man. The produce in 1876 was 23,613 tons of ore, valued at £90,142. The metallic zinc obtained from this amounted to about 6,641 tons, valued at £158,011.

Sulphur ores (iron pyrites) were raised in different parts of Great Britain; chiefly in Cornwall, to the extent, in 1876, of 48,809 tons, worth £43,870.

The following minerals are also raised in Cornwall, viz., arsenic, manganese, gossan, nickel, silver-copper, fluor-spar, and wolfram.

Salt occurs in Cheshire, Worcestershire, Staffordshire, and Ireland; produce (1876) 2,273,256 tons, valued at £1,136,628.

The mineral produce of Great Britain amounted in 1876 to £58,691,832.

Physical Geography.—The physical features of a country are intimately connected with its geological structure. The older paleozoic rocks produce mountainous regions, intersected with deep and narrow valleys. The newer strata seldom rise to a great height. Their high lands are rounded undulations of the strata, except where igneous rocks are intruded, and the valleys are broad and shallow. In Scotland we have, consequently, two extensive mountainous districts, occupied chiefly with rocks of silurian age, and an intervening valley filled up with old red sandstone and carboniferous measures. The northern mountain region is intersected by the Great Glen, which is a fissured anticlinal axis in the silurian strata. It is difficult to group the mountains in this district. The Grampians from Aberdeen to Argyle show the most marked linear arrangement; the greatest eminence in this range is Ben Lawers (3,945 feet). Between the Grampians and the Great Glen a succession of great eminences occur, the highest of which, and the culminating point of the whole British isles, is Ben Nevis (4,406 feet). To the n. of the valley of the Caledonian canal, the region is a confused mass of mountains, reaching in Ben Attow a height of 4,000 feet. Caithness consists of plains of undulating sandstone, covered with drift; the headlands and sea-cliffs in this county are bold and striking. The coast-line of the paleozoic region of the n. of Scotland is repeat-

edly broken by numerous and large friths or sea-lochs, and the interior abounds in picturesque lakes. The silurians of the s. of Scotland form an extensive mountain range crossing the island from St. Abb's Head to Stranraer. The rocks are less indurated than in the n., and the scenery is consequently not so wild. The mountains have generally broad flattened forms, intersected by deep pastoral glens, which widen out into broader valleys and dales. The principal heights are Hartfell (2,790 ft.) and Black Larg (2,890 feet). The great central valley of Scotland embraces the basins of the Clyde, Forth, and Tay. It contains several tracts of rich table-land, and is frequently broken through by igneous rocks, chiefly trappean, which project into bold and picturesque hills.

England and Wales, in the Cambrian and silurian districts, have the same mountainous character as similar districts in Scotland; but as so much of England is occupied with newer strata, it may be considered on the whole as a level country, traversed by ridges of varying elevation, which form the water-sheds of the country. The range, beginning with the Cheviot hills, is continued from the borders of Scotland southwards, as the Pennine range, through Northumberland, Cumberland, Westmoreland, Lancashire, and Yorkshire, to the middle of Derbyshire; it varies in height from 1200 to 3,000 ft., reaching its highest summit in Crossfell, Cumberland, which is 3,383 ft. high. The band of lias and oolite, extending from Yorkshire to Dorset, forms a tortuous range of table-land, rising sometimes into hills to the height of 1500 ft., and throughout its course presenting generally a bold escarpment to the w., and having a gentle slope to the east. To the w. of this range of table-land are the valleys of the Yorkshire Ouse, the Trent, and the Severn; on the e., the Great Ouse and the upper portion of the Thames. Beyond these two rivers, the country rises into a range of low chalk-hills, which follow the cretaceous strata from Norfolk to Wilts, dividing with the strata into three ranges, two of which take an easterly direction through Sussex and Surrey and Kent, bordering the Wealden strata, and forming the s. and n. Downs. Devon and Cornwall are mountainous, from the intrusion of granite and other igneous rocks through the paleozoic strata.

The details of the physical geography are given under the names of the several counties, lakes, rivers, etc.

Climate.—The climate of Great Britain derived its peculiar character from the insular situation of the country, taken in connection with the prevailing direction of the winds. It is mild and equable in a remarkable degree, the winters being considerably warmer, and the summers colder than at places within the same parallels of latitude. For at least three months, the mean monthly temperature ranges between 50°.0 and 60°.0; for other three months it continues about 60°.0, or occasionally a little higher, seldom more than three degrees; and for the remaining six months it ordinarily ranges between 36°.0 and 48°.0. Since the reports of the registrar-general clearly prove that the temperature most conducive to health is between 50°.0 and 60°.0, it follows that, as far as concerns temperature, the climate of Great Britain is one of the healthiest in the world.

As appears from data furnished by the reports of the English and Scottish meteorological societies, the mean temperature of England is 49°.5, and of Scotland 47°.5. The mean temperatures of the following places, arranged according to the latitude, have been deduced from the same sources: Guernsey, 50°.2; Truro, 51°.3; Ventnor, 51°.5; Barnstaple, 50°.8; Aldershott, 49°.4; Greenwich, 49°.5; Bedford, 49°.3; Derby, 48°.8; Liverpool, 48°.9; Manchester, 48°.0; Isle of Man, 47°.8; Scarborough, 47°.0; Milne-Graden (Berwick), 46°.8; Dalkeith, 46°.9; Rothesay, 47°.8; Greenock, 47°.9; Arbroath, 46°.6; Culloden, 46°.8; Tongue, 46°.5; Sandwick (Orkney), 45°.6; and Bressay (Shetland), 45°.3. There is thus a difference of fully six degrees between Ventnor, in the Isle of Wight, and Shetland. As this difference is chiefly attributable to the difference of their latitudes, it follows, that it will become greater as the force of the sun's rays increases; and hence, while the winter temperatures are respectively 42°.2 and 39°.5, the summer temperatures are 61°.8 and 53°.4. A pretty regular decrease of temperature, with an increase of latitude, will be observed, particularly if the places on the w. side of the island be regarded as a distinct series by themselves. It will appear, on examination, that the temperatures of places on the w. are about a degree in excess of those of places in the same latitudes, but at some distance from the Atlantic. In winter, the differences between the w. and the other parts of the country are still greater. Thus, whilst the winter temperature of Truro is 45°.0; Guernsey, 43°.8; Ventor and Barnstaple, 42°.2; Isle of Man, 41°.8; Liverpool, 40°.6; and Greenock, and the whole of the w. coast of Scotland as far as Shetland, 39°.5—that of Greenwich is 37°.9; Nottingham, 37°.3; York, 37°.1; Scarborough, 38°.8; Dalkeith, 37°.0; Arbroath, 37°.1; and Culloden, 38°.2.

The s.w. winds are the most prevalent throughout the year, except in April and May, when they give place to the n.e. winds. The notoriously dry and parching character of the latter render them very deleterious to health. On the other hand, the s.w. winds, coming from the Atlantic, are moist and genial, and it is on their greater frequency—being, as compared with the n.e., in the proportion of two to one—that the salubrity of the climate in a great measure depends.

In those districts of England where hills do not interfere, the annual rainfall is about 25 in., and in similar parts of Scotland about 28 in.; but these amounts, which may be

considered as the mimimum falls, are variously increased by proximity to hills, according as the place is situated in the e. or w. of the island, viewed in relation to the direction of the wind which brings the rain, and by its lying to the wind or lee side of these hills. Since it is the s.w. winds which bring the rain, the heaviest falls take place among the hills in the w. of the country; and it may be here observed that, in the w., where there are no hills lying to the n.w., w., or s.w., the annual rainfall is about the mimimum. The annual rain fall in Cornwall, Wales, Cumberland, and the west Highlands, may be estimated at from 45 to 65 inches. In some places, however, this amount is far exceeded. At Seathwaite, in Cumberland, for instance, the rainfall is truly tropical, the mean annual amount being 127 in.; in 1861 it was 182 in.; and in the month of Nov. of that year the enormous quantity of 35.41 in. fell at this station. At Tyndrum, in Perthshire, 134.5 in. fell in 1861; and at this place, and among the Arrochar hills, the monthly rainfall is occasionally between 20 and 30 inches.

Natural History.—The natural history of Great Britain corresponds generally with that of continental Europe (q.v.). Very few species, either of plants or animals, are peculiar to Great Britain. The flora of the greater part of the island most nearly resembles that of Germany; but in the s. of England there is, as might be expected, a closer correspondence with that of the n.w. of France; and some plants found in the Channel islands and on the French coast appear nowhere in Britain but in the s.w. of England. The mountains of Wales, Cumberland, and Scotland have a vegetation resembling that of Scandinavia more than that of the mountains of central or southern Europe. The state of the case is much the same as to the fauna. There are, however, many remarkable instances both of plants and animals, which, from these apparent relations to continental Europe, might be expected in Great Britain, and which are not indigenous to it. As examples, may be mentioned, among plants, the Norway spruce, and among animals, the lemming, both common in Scandinavia. The progress of civilization and of cultivation has completely banished from Great Britain many of the animals which were once numerous, as bears, wolves, etc. But on the contrary, many plants which were unquestionably introduced by man, have become thoroughly naturalized.

Ethnology.—The present population of the island of Great Britain is the result of successive waves of immigration and conquest. When the Romans invaded Britain (54 B.C.), the inhabitants were Celtic; and they continued to be essentially so until the 5th and 6th centuries, when—the Romans having previously retired—the level parts of the country were gradually overrun and subdued by German tribes from the opposite coasts. Then followed invasions of Danes and other Scandinavian nations, and lastly the Norman conquest. As the Normans, however, were originally from Scandinavia, they cannot be considered as adding any new ethnological element; so that the inhabitants of England (excepting Wales) and of the Lowlands of Scotland may be considered as sprung from an amalgamation of the original Celtic with German and Scandinavian blood, the latter having predominated so as to determine the language, institutions, and character of the resulting race. Wales and the Highlands of Scotland are still inhabited by representatives of the ancient Celtic tribes. See WELSH LANGUAGE AND LITERATURE; SCOTLAND; PICTS; IRELAND; CELTIC NATIONS; BRITANNIA; and ANGLO-SAXONS.

Notwithstanding the union of the two kingdoms into which the island was once divided, the distinction, for certain purposes, is still kept up. England (including Wales), the larger and southern division, extends as far n. as the parallel of 55° 48′, the boundary-line running between Berwick-on-Tweed and the Solway firth (see BORDER, THE); its greatest length is about 400, and its greatest breadth about 320 miles. Area, about 58,300 sq. miles. England resembles to some extent a triangle in shape, its southern shore forming the broad base, and its e. and w. coasts gradually approaching until the apex is reached at Berwick-on-Tweed. Scotland occupies the northern part of the island; its greatest length (from the Mull of Galloway to Dunnet Head) is about 287 m.; its greatest breadth (from Peterhead to Ardnamurchan point) about 182 m.; elsewhere, however, the breadth is much less. Between Alloa, on the Forth, and Dumbarton, on the Clyde, it is only 33 m.; between the head of Loch Broom, on the w. coast, and of Dornoch firth, on the e., only 26 m., and n. of Inverness, the average breadth does not exceed 70 miles. The entire area is about 31,300 sq. miles. The greater part of the surface of Scotland is irregularly distributed into mountain and valley, a very small proportion spreading into level plains. The eastern coast forms a waving, continuous, and rarely broken line; but the western is extremely irregular, being deeply indented with bays and arms of the sea, and exhibiting steep promontories and mountainous islands. The whole country is physically divided into *highlands* and *lowlands*—the former comprehending the n.w., w., and central portions; the latter, generally speaking, the e. coast, and the country s. of the Forth and Clyde.

Islands.—The Island of Great Britain is surrounded by the Isle of Man, Anglesey, the Scilly isles, the Isle of Wight, the outlying Channel islands, the Shetland isles, the Orkneys, and the Hebrides, each having generally a mainland encircled by small islands and rocks, bare or scantily covered, which sea-fowls inhabit, fishermen in their boats visit, and shepherds sometimes dwell in during summer. The coast against the North sea has few islands, except Thanet, Sheppey, and some lowlands, which are isolated at high water. Coquet, Staples, Holy island, May island, Inchkeith, and Inchcolm, are the only ones inhabited. The Orkneys and the Shetlands lie to the north. St. Michael,

Looe, and the isle of Wight, are the only islands on the s. coast, except those sometimes connected with the land, and the Channel islands off the coast of Normandy. All the other islands lie on the w. coast, extending from the Scilly isles, through Anglesey and Man, to the island of Lewis. According to the census of 1851 there were about 500 of these islands and rocks, of which only 175 were inhabited; but in 1861 a more careful enumeration was made, when it was ascertained that Scotland alone had 787, of which 186 were inhabited. The number belonging to England was not stated.

For administrative purposes, Great Britain, with its surrounding islands (excepting the Channel islands and the isle of Man, which are under peculiar jurisdiction), is divided into 84 counties or shires. The following tables exhibit their several areas and populations·

ENGLAND.

Counties.	Area in Stat. Acres.	Inhabited Houses, 1871.	Population, 1871.	Population, 1861.
Bedford	295,582	30,508	146,256	135,265

The United Kingdom of Great Britain and Ireland is, since the union of Ireland, the full official designation of the country more generally known as Great Britain, Britain, or the United Kingdom. In addition to the home territories, Great Britain possesses a multitude of dependencies scattered over every part of the globe, and constituting "an empire on which the sun never sets."

The following tables exhibit the extent and population of the several constituent parts of this empire, according to the latest available accounts:

Most of the subjects which enter into a complete account of Great Britain are treated under separate heads. The following are brief indications of a general kind:

Agriculture.—The soil of Great Britain is almost exclusively devoted to the production of the two necessaries—breadstuffs and grass (roots, etc., for domestic animals). For this purpose, both the soil and the climate are admirably suited. M'Culloch estimated the number of acres in England under grain crops in 1852-53 at 6¼ millions (wheat, 3 millions; barley, 1; oats and rye, 2; beans and peas, ¼), and the total produce at 27½ million quarters—value £37,000,000. The produce of potatoes, turnips, rape, and clover is estimated at £26,000,000. The annual value of the pastures and meadow-hay is immense. In 1857, according to the careful statistics collected by the highland and agricultural society of Scotland, there were in Scotland 3,556,572 acres under rotation, the chief crops being grass and hay, 1,459,805 acres; oats, 938,613 acres, yielding 32,750,763 bushels; wheat, 223,152, yielding 6,154,986 bushels; barley, 198,387, yielding 6,564,429 bushels; turnips, 476,691 acres, yielding 6,690,109 tons; potatoes, 139,819 acres, yielding 430,468 tons. The live-stock amounted to 6,989,368—viz., 185,409 horses, 974,437 cattle, 5,683,168 sheep, and 146,354 swine. The total extent of land returned in 1874 as being under all kinds of crops, bare fallow, and grass was 31,266,919 acres in Great Britain, 15,752,187 acres in Ireland, 94,100 acres in the Isle of Man, 18,436 (1873) acres in the island of Jersey, and 11,678 acres in the islands of Guernsey, Alderney, etc., making a total for the United Kingdom of 47,143,320 acres. The total acreage of land returned as under cultivation in Great Britain has been larger in each year since the returns were first collected from all occupiers of land in 1868. The live-stock in the

* In 1875. † In 1870. ‡ In 1869.
§ Cyprus (q.v.), though now occupied and administered by Great Britain, is of course not properly a "possession."

United Kingdom in 1874 was as follows: The number of horses included in the agricultural returns was 1,847,148; in Great Britain, only horses used for agriculture, unbroken horses, and mares kept solely for breeding, are included in the returns; by adding 915,000 for the estimated number of all descriptions of horses, we find the total number of horses in the United Kingdom to be 2,860,000. The total number of cattle returned for the United Kingdom in 1874 was 10,281,036; of sheep the total number was 34,837,597; and of pigs, 3,557,354. Of these numbers of live-stock, Great Britain (exclusive of the islands) possessed 2,225,000 horses, and Ireland 525,770; giving a proportionate number, per 100 acres of land under cultivation, of 7.1 in Great Britain, and 3.4 in Ireland. Of cattle of all kinds there were 6,125,491 in Great Britain, or 19.6 per 100 acres; and 4,118,113, or 26.1 per 100 acres, in Ireland. Sheep numbered 30,313,941, or 97.0 per 100 acres, in Great Britain, and not more than 4,437,613, or 28.2 per 100 acres, in Ireland. There were 2,422,832 pigs, or 7.7 per 100 acres, in Great Britain, exclusive of those kept by cottagers and in towns; and 1,096,494, or 7.0 per 100 acres, in Ireland.

Manufactures.—The following table exhibits the condition of the textile manufactures:

	Factories in					Horse-power in				Hands employed.

The jute trade is rapidly rising into importance, especially in Scotland. In 1861 there were 36; in 1868, 41; and in 1875, 110 jute factories in the United Kingdom; and the total number of persons, male and female, employed in this manufacture in 1875 was 37,920.

For other great branches of industry, see Iron, Paper, Pottery, etc.

Imports and Exports.—The following table exhibits the value of the imports and exports for the years 1857, 1858, 1861, and 1875:

	1857.	1858.	1861.	1875.
Imports		£164,582,832	£217,351,881	£373,941,125
Exports, British Produce	£137,844,441	116,608,756	125,115,133	223,494,570
Exports, Foreign and Colonial Produce	122,066,107	23,174,023	35,694,297	45,402,198
Total Exports	24,108,194	£139,782,779	£160,809,430	£268,896,768
Total Imports and Exports	£146,174,301	£304,368,611	£378,161,311	£642,837,893
	£334,018,749			

The chief imports are raw cotton, corn and flour, sugar, wool, silk manufactures, and tea; the chief exports are cotton manufactures, woolen and worsted manufactures, iron and steel, linen manufactures, coals and culm, and machinery.

Gold and Silver Bullion and Specie.—The computed real value of the gold and silver bullion and specie brought into the United Kingdom in 1858 was £29,493,190; in 1859, £37,070,156; in 1860, £22,978,196; and in 1861, £18,747,045. Of this quantity, Australia sent by far the most—viz., in 1858, £9,066,289; 1859, £8,627,854; 1860, £6,719,857; and 1861, £6,331,828. Mexico, South America, and the West Indies were the next largest exporters; then the United States and France. The exports from the United Kingdom during the same period were—1858, £19,628,876; 1859, £35,688,803; 1860, £25,534,768; 1861, £20,811,648. The declared real value of gold and silver bullion and specie imported into the United Kingdom during the year 1871 was—gold, £21,613,005; silver, £16,527,322; total, £38,140,327; exported—gold, £20,698,275; silver, £13,062,396; total, £33,760,671. The declared real value of such bullion and specie imported during the year 1875 was as follows—gold, £23,100,834; silver, £10,123,955; total, £33,224,789; exported—gold, £18,810,426; silver, £8,906,726; total, £27,717,152.

Shipping.—Great Britain had, in 1861 (exclusive of river-steamers), 19,288 registered sailing-vessels, with an aggregate burden of 3,918,511 tons, and 997 steamers, carrying 441,184 tons, making together 20,285 vessels, of 4,359,695 tons burden, and employing, exclusive of masters, 171,957 seamen. During the same year, there were built and registered in the United Kingdom 1186 vessels, 215 of them steam, of an aggregate burden of 310,900 tons. The total tonnage of vessels entering and clearing British ports in 1861 was 26,595,641 tons, 21,924,983 tons representing cargoes, the rest being in

ballast. The coast trade of Great Britain during the same year amounted to 17,355,235 tons, all but 93,000 tons being carried by British ships. In 1871 the number of registered sailing-vessels engaged in the home trade was 11,838, employing 41,828 men, and their tonnage was 777,185. The number of steam-vessels, exclusive of river steamers, in the same trade was 1191; men, 12,613; tons, 195,125. The number of sailing-vessels engaged in foreign trade was, in the same year, 300, with 5,767 men, and an aggregate of 157,964 tons; and of steam-vessels, 1066, with 40,323 men, and an aggregate of 936,914 tons. In 1875 there were in the United Kingdom 20,644 sailing-vessels and 4,160 steamers registered under the merchant shipping act. The estimated number of seamen was 257,336, an increase of more than 50,000 since 1870. It will be seen that the merchant navy is availing itself, to a large degree, of steam-power.

Railways.—The total length of lines open for traffic in the United Kingdom in 1860 was 10,433 miles. During the year, 163,435,678 passengers traveled, of whom 20,625,851 were first class, 49,041,814 second class, and 93,768,013 third class. The amount of money derived from these travelers was—first class, £3,170,935; second class, £3,944,713; third class, £4,162,487. Luggage, mails, etc., brought up the receipts from passenger-traffic to £13,085,756. The goods-traffic in the same year amounted to £14,680,866, making a total income of £27,766,622. The total amount invested in railways by shares and loans in 1858 was £325,375,507, on which was paid interest to the total amount of £6,653,166. The average rate of dividend on the ordinary share capital over the whole kingdom in 1858 was 3.06 per cent; the proportion per cent of expenditure to total receipts in 1860 was 47. In 1860 the rolling-stock of the various companies consisted of 5,801 locomotives, 15,076 carriages of all kinds, and 180,574 wagons. At the end of 1874 there were 16,448 miles of railway open for traffic—showing an addition since 1860 of 6,015 miles. Of this entire length 11,622 miles belonged to England and Wales; to Scotland, 2,609; and to Ireland, 2,127. To the total capital paid up, England and Wales contributed £508,720,097; Scotland, £71,327,140; and Ireland, £29,902,682. At the end of 1877 there were 12,098 miles of railway open in England and Wales; 2,776 in Scotland; in Ireland, 2,203—in all, 17,077 miles.

Revenue and Expenditure.—The following table shows the total amounts of the actual revenue and expenditure for the seventeen years from 1860 to 1875, along with the proportion of receipts and of expenditure for each person in the United Kingdom:

	Revenue.		Expenditure.	
	Receipts at the Exchequer.	Proportion per head of Population.	Payments out of the Exchequer.	Proportion per head of Population.
		£ s. d.		£ s. d.
1860	£71,089,669	2 9 10	£69,502,289	2 8 8
1861	70,283,674	2 8 11	72,792,059	2 10 8

1876	77,131,693	.....	76,545,208	.....

The income of the United Kingdom is derived from the various sources of customs, excise, stamps, taxes, property and income tax, post-office, etc. The following are the sums received by the exchequer from these sources during the financial year 1876–77: Customs, £20,410,420; excise, stamps, taxes and income-tax, £47,794,840 (of which the net receipts from customs were £19,922,000; from excise, £27,736,000; from stamps, £10,890,000; from land-tax, £2,532,000; from income-tax, £5,280,000): post-office, £7,314,750; telegraph service, £1,305,000; crown-lands, £539,411; miscellaneous, £4,572,321. Total, £81,945,535. The following are the principal items of expenditure in the same year: Interest and management of debt, £27,992,813; army, £16,814,716; navy, £11,364,383; miscellaneous civil services, £13,333,851; charges for collecting customs and inland revenue, £2,766,279; post-office, £3,159,218; telegraph service, £1,141,000.

National Debt.—At the end of the financial year 1877, the national debt of Great Britain and Ireland amounted to £775,873,713, of which £712,621,355 was funded, and £13,943,800 was unfunded. See Debt, National.

Army and Navy.—See British Army; and Navy, British.

Form of Government.—The government of Great Britain is of the kind known as a "constitutional monarchy," in which the sovereign accepts of his dignity under an express

agreement to abide by certain prescribed conditions. See CORONATION OATH. The sovereignty is hereditary in the family of Brunswick, now on the throne, and in the person of either a male or a female. The sovereign (king or queen) is the directing power in the executive of government; while the legislative function is exercised by parliament. Further information regarding the British constitution and laws will be found under the heads PARLIAMENT; MINISTRY; COMMON LAW, COURTS OF; JUDGES, etc.

Money, Weights, and Measures.—See POUND; MINT; WEIGHTS AND MEASURES.

Religion.—The United Kingdom is a Protestant state, but all religions—not offensive to public or private morals—may be professed, and their different forms of worship practiced, without interference from any quarter whatever. There are two churches "established" by special acts of the legislature. In England the established church is Episcopal in its government. In Scotland, on the other hand, the established church is Presbyterian. See SCOTLAND, CHURCH OF. According to the census returns of 1851 (in the returns of 1861 and 1871, religious statistics were not included, as the government shrank from re-opening a subject which had formerly given rise to much controversy), the number of places of worship, together with the sittings provided, in England and Wales, and the estimated number of attendants on a particular day, were as in the tables below.

Education.—In England, the chief institutions for education are the ancient national universities of Oxford and Cambridge; the more recent institutions of London, Durham, and Lampeter in Wales; the classical schools of Eton, Westminster, Winchester, Harrow, Charter-house, and Rugby; Owens college, Manchester, and other colleges and schools chiefly for physical science; the various military schools; the colleges of the dissenting denominations; the middle-class schools, either started by individual teachers, and hence called "adventure" schools, or by associated bodies acting as directors, to whom the teachers are responsible; and the schools of design.

For primary education, a national system has now been established. Under the elementary education act for England, 1870, a popularly elected school-board is established in any district where the existing schools are deficient. Schools under the act are supported by school-rates and fees, and by parliamentary grants, varying according to the number of pupils, and their proficiency as tested by different standards of examination. They are to be open at all times to government inspection. It is left to the discretion of school-boards to make education compulsory.

Scotland possesses four universities for the higher branches of education—viz., those of Edinburgh, Glasgow, St. Andrews, and Aberdeen, besides a variety of minor colleges connected with the Episcopalian, free church, and other non-established churches. The Scotch education act, 1872, is modeled after the English act, but differs from it, by enacting that a school-board is to be elected in *every* parish and burgh: by making it illegal for parents to omit educating their children, between 5 and 13, in reading, writing, and arithmetic; and by comprehending higher-class schools. The number of day-schools to which annual grants are made in England and Wales, inspected in 1874, was 12,167; the daily average attendance throughout the year was 1,678,759; 2,034,007 scholars were present at inspection; 857,611 were examined; and 508,232 passed the prescribed tests. 1432 night schools were examined, with an average attendance of 48,690 scholars above 12 years of age. On the registers of the inspected schools were 2,497,602 children of whom 617,910 were under 6 years of age, 1,630,033 were between 6 and 12, and 229,659 were above 12. In Dec., 1874, there were 20,162 certificated teachers, 1999 assistant-teachers, and 27,321 pupil-teachers.

History.—On May 1, 1707, during the reign of queen Anne, the union of England and Scotland was formally accomplished. (For the previous history, see ENGLAND and SCOTLAND.) In the latter of these countries, the terms at first excited the utmost dissatisfaction, and even indignation; but the progress of time has shown it to be one of the greatest blessings that either nation could have experienced. The last years of queen Anne's reign were marked by the triumph of the tory party, headed by Harley and St. John (Oxford and Bolingbroke), who kept up a constant intrigue with the pretender, for the purpose of procuring his restoration. This treachery was defeated by the sudden death of her majesty in 1713. According to the act of settlement, she was succeeded by the elector of Hanover, who took the title of George I. The whigs then regained their ascendency, and, under the guidance of Walpole (q.v), now rising to eminence, at once proceeded to impeach the more important of the tory leaders. Other severities drove the more impatient of that party to attempt bringing in the pretender by force of arms. In 1715 the earl of Mar in Scotland, and the earl of Derwentwater in England, raised the standard of rebellion; both efforts, however, proved abortive, and were speedily crushed. Five years later, occurred the frightful catastrophe known as the south sea bubble, when the nation was saved from anarchy mainly by the exertions of Walpole. The latter now became premier and chancellor of the exchequer, and under him the commerce and manufactures of England continued steadily to advance, though little improvement was as yet perceptible either in Scotland or Ireland. George I. died in 1727, and was succeeded by his son George II. An attempt was again made by the tories to oust the whigs from power, but was frustrated by Walpole, who still continued the prime mover of public affairs. In 1739 after a peace of extraordinary duration, he was forced by popular clamor into a war with Spain, on account of some efforts made by that country to check an illicit trade carried on by British merchants in its American colonies. This war was feebly carried on, and ingloriously terminated; but the attention of England was speedily drawn towards the Austrian war of succession in which it was involved through the anxiety of the king for his Hanoverian possessions, and the strong antipathy of the people to the French. Walpole, disapproving of the war, was driven from office in 1743. George II. appeared on the field of battle himself, and at Dettingen proved himself a man of courage and spirit. But the success of the French at Fontenoy in 1745 paralyzed the efforts of England during the rest of the campaign; and in 1748, after nine years' fighting, a peace was concluded at Aix-la-Chapelle, by which it was agreed that both nations should mutually restore their conquests, and go back to exactly the same condition as they were in before the war! Meanwhile, a second attempt had been made (1745-46) by prince Charles Edward Stuart to win back the throne of his ancestors. This attempt, known as the second rebellion, was crushed at Culloden (April 16, 1746), and shortly after, a variety of important measures were passed by the imperial parliament relating to Scotland generally, and to the Highlands in particular, which had the effect, on the whole, both of conciliating the inhabitants, and of increasing their civilization. Now after a long period of indolence and poverty, Scotland began to make advances towards that equality with England, in respect of comfort and prosperity, which it has since attained.

In 1756 broke out the "seven years' war," in which Britain took the side of Frederick the Great against France, Austria, Russia, and Poland. It achieved no triumphs in Europe; on the contrary, it suffered a signal disgrace in the surrender of the duke of Cumberland, with 40,000 men, in Hanover; but in India, Clive deprived the French of most of their possessions, while Wolfe, in the new world, conquered their colony of Canada. In the midst of this war, George II. died (1760), and was succeeded by his grandson, George III., whose reign proved to be the longest and one of the most eventful

in the annals of British history. At this time the principal secretary of state was William Pitt, afterwards the great earl of Chatham; but the favor which George III. showed to the earl of Bute, a feeble and narrow-minded tory nobleman, rendered it necessary for the former to retire from office. Spain now joined France against Britain, as Pitt had foreseen and foretold; but fortune showered her brightest smiles upon the arms of the latter, and at the peace in 1763 she was allowed to retain many of the most valuable colonial possessions of both her antagonists. These wars, however, largely increased the national debt.

George III. now showed himself anxious to destroy the influence of the great whig families who had brought in the dynasty to which he belonged. The nation took the alarm, and for some time was strongly disaffected towards its sovereign, who was believed to be wholly under the influence of his Scotch premier, the earl of Bute. Popular indignation at last forced the latter to resign in 1763. His successor, Grenville, inaugurated his advancement to office by the prosecution for libel of Wilkes, the member for Aylesbury, who had made himself conspicuous by his attacks both on Bute and his royal master. The proceedings in this case lasted some years, and were attended with tumults of a serious nature, and a vehemence if not rancor of public feeling that indicated the magnitude of the discontent which prevailed. During the administration of Grenville, too, the first attempt was made to tax the American colonies by the passing of the stamp act in 1765. Against this the colonies protested, and the succeeding whig ministry of Rockingham repealed it. This ministsy, however, was of short duration, and was replaced by one formed by Pitt, now created earl of Chatham. The necessity for an increase of the finances led to another attempt at American taxation, and an act for imposing duties on the imports of tea, glass, and colors was passed. This measure excited the most determined opposition among the colonists; and finally, in 1774, war broke out between them and the mother-country, which lasted eight years, and in which the former were supported by France, Spain, and Holland. It resulted in the acknowledgment of their independence, and in the formation of the republic of the United States (1783). During almost the whole of this unhappy contest, the ministry of lord North directed the policy of the country; and it was only the success of a vote for the conclusion of the war that forced them to resign early in 1782. It was followed by the second Rockingham ministry, and that soon after by the Shelburne ministry, only remarkable for the appearance in it of the younger Pitt. The lukewarm whiggism of lord Shelburne gave offense to Fox and other more advanced political thinkers; the result was a coalition of the Foxites with the followers of lord North. This coalition, factious and unprincipled in the last degree, triumphed, and under the name of the coalition ministry, held the seals of office during the year 1783. Fox's *India bill*, the purpose of which was virtually to transfer the government and patronage of India from the East India company to the house of commons, was the cause of its ruin. This bill was considered by the king to aim at fixing the ministry in power beyond the control of both himself and the people, and having induced the house of lords to reject it, he compelled the ministry to resign. Pitt was then appointed prime minister and chancellor of the exchequer. See PITT. In 1786 commenced the trial of Warren Hastings, who was impeached by the whig leaders, Fox, Burke, and Sheridan, but was ultimately acquitted. Meanwhile, the progress both of England and Scotland was unquestionable; manufactures increased, agriculture improved, and—especially in Scotland—an interest in the discussion of political and other questions of importance spread through the community, as may be seen very clearly in the poetry of Robert Burns. The French revolution (1789) at first strengthened this interest, but the excesses of the reign of terror produced a decided reaction; and for many years all classes, at least all the so-called "respectable classes," were fanatically averse to the slightest innovation. In 1793 the ministry of Pitt, without any real cause, declared war against the French republic, in spite of the opposition of Fox and Sheridan. This contest lasted till the peace of Amiens in 1801, and was, on the whole, very disastrous to Great Britian, except at sea, where the victories of Howe of Brest, Jervis off cape St. Vincent, Duncan off Camperdown, and Nelson in Aboukir bay, served to sustain the spirit of the nation. Other features of the time were the *threatened* invasion of Britain by the French, which called forth volunteer corps in every part of the island; the Irish rebellion, which, though assisted by a French force, proved a failure; and the trial and condemnation at Edinburgh of the popular reformers, Mure, Palmer, etc. Pitt, who had left office just before the peace of Amiens, was succeeded by Addington, who was compelled to renew the war with Bonaparte in 1803, on account of the way in which the latter evaded fulfilling the conditions of that peace. Again, Bonaparte threatened to invade the country, and collected an immense flotilla at Boulogne, professedly for that purpose, in 1803, but was completely kept in check by Nelson. The battle of Trafalgar in 1805, nearly annihilated the navy of France and Spain. But on land, the arms of France were victorious; and the battle of Austerlitz (1805) broke up most effectually that coalition of continental powers against France which Great Britain had fostered and formed. The shock of this disaster gave a death-blow to Pitt, who expired in the beginning of 1806, and was followed to the grave in the autumn of the same year by his rival, Fox. The overthrow of Prussia at Jena and Auerstadt, and of Russia at Friedland, placed Great Britain in a most perilous predicament. All the nations of Europe were compelled by Bonaparte to exclude British mer-

chandise from their ports, and the island of Great Britain itself was declared in a state of blockade. Secure, however, in the protection of her invincible navy, she bore up bravely against her terrible isolation, increased her intercourse with her own vast colonies, ruined the commerce of her enemies, and never ceased her efforts to undermine the influence of her great enemy on the continent. The first people that showed a tendency to revolt against the arrogant tyranny of Bonaparte were the Spaniards. Great Britain at once offered to assist them with arms and money, and in 1808 a force was landed in Portugal, under the command of sir Arthur Wellesley, afterwards duke of Wellington. The war which ensued (known as the "peninsular war") lasted till 1814, and ended in the French being driven back in disorder into their own country at Toulouse. Meanwhile, ruin had overtaken the French army in Russia; Austria, Prussia, and Russia had combined with Great Britain against Bonaparte; and in 1814 the allies entered Paris, and the French emperor was forced to abdicate, and retire to Elba. His return in 1815 once more threw Europe into disorder and agitation; but his power was finally shattered at Waterloo by Wellington and Blucher, and peace restored to Europe. The contest had cost Britain (which had to subsidize most of her allies) an enormous expense. See DEBT, NATIONAL.

Now that the long conflict between France and Europe was over, the thoughts of the people were again turned to the question of political reform. Four years of extraordinary mercantile depression, which followed the victory at Waterloo, partly resulting from bad harvests, and partly from Great Britain's having ceased to enjoy that monopoly of commerce which she did during the war, had made the people discontented, and the shameful massacre of the Manchester operatives in St. Peter's fields by the yeomanry in 1819—commonly known as the Peterloo massacre—excited strong indignation; but a horror of anything revolutionary still possessed the upper and a large section of the middle classes, and severe measures were passed with a view to the suppression of discontent among the working-classes. In 1820 George III. died, and was succeeded by his eldest son, George IV. The trial of his consort, queen Caroline, which occurred in the same year, shattered his popularity, which was never very great. The commercial reforms of Huskisson, supported by Canning, which marked the next two years, added immensely to the prosperity of Great Britain, and capital grew so abundant, that a vast number of joint-stock companies were formed, as a means of giving it a wider range. Many of their projects for traffic in remote countries were quite visionary, and ended disastrously, involving in ruin (between Oct., 1825 and Feb., 1826) fifty-nine English provincial banks, and inflicting the greatest misery upon the working-classes. About the same time, the Irish Catholics began to clamor for emancipation from their civil disabilities. The older and more inflexible tories, who were still dominant in parliament, opposed it; but the intense determination of the Irish people, and the powerful eloquence of their champion, Daniel O'Connell, at last prevailed, and in 1829 the ministry of Wellington, yielding to the storm, itself proposed and carried the measure. In 1830 George IV. died, and was succeeded by his brother, William IV. The outburst of the July revolution in France quickened the paces of British reformers; the demand of the nation for an improvement in the parliamentary representation became very strong; and in Nov., 1830, after an exclusion from office of nearly half a century, the whigs once more ascended into power "on the breath of popular applause," and the ministry of earl Grey immortalized itself by passing the "reform bill." Another of its claims to the respect and gratitude of posterity was the abolition of slavery in the British colonies (1834). The reform of the English poor-law, and in the mode of electing municipal authorities in Scotland, also deserves mention; but in 1834 the whig ministry was dismissed by the sovereign. Sir Robert Peel now became premier, but the whigs were still in a majority in the house, and Peel was compelled to resign. The Melbourne administration which followed carried several small though beneficial measures of reform, but it failed to secure the attachment of the people. The lower classes were becoming radical and chartist, while the middle classes, contented with the political power which the reform bill had secured to them, were growing apathetic, and in many cases, from dread of the masses, were leaning towards toryism. In the midst of these perplexities, William IV. died in 1837, and was succeeded by his niece, the princess Victoria, the present ruler of the united empire. In 1841 the whig ministry succumbed to a vote of "no confidence," and sir Robert Peel once more assumed the helm of state. The principles of free trade now began to be actively advocated; public opinion was leavened by the platform addresses of Mr. Cobden and Mr. Bright, until the prime minister himself was finally converted, and in 1846 carried, what he had long opposed, a measure for the abolition of the *corn-laws*. Three years before the abolition of the corn-laws, a great religious schism took place in the established church of Scotland, and led to the formation of a body calling itself the "Free church of Scotland" (q.v.). Other important incidents of this period were the Chinese and Afghan wars; the chartist agitation, which reached its climax in the monster petition of 1848, got up by Feargus O'Connor and his friends; the series of failures in the potato-crop of Ireland, involving that country in terrible misery, and inundating Great Britain with paupers. Sir Robert Peel was succeeded in the government of the country by lord John Russell, who did not prove as popular a minister as was anticipated, and in 1852 the old tory party returned to power, headed by the earl of Derby and Mr. Disraeli. It

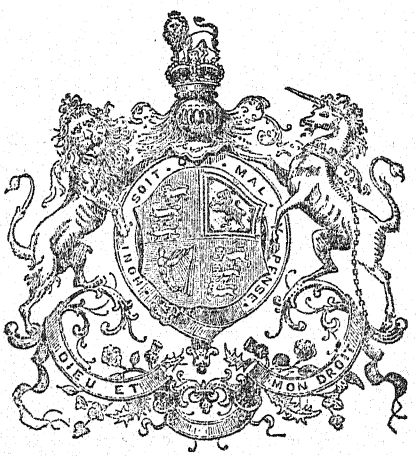
was, however, beaten on its budget, and forced to resign in less than a year, when its place was taken by the coalition cabinet of lord Aberdeen. During the ministry of this nobleman, the *Crimean war* began (1854); but as lord Aberdeen was considered to be somewhat pro-Russian in his likings, he was obliged to make way for lord Palmerston in 1855. Two years later (May, 1857), the Indian mutiny broke out, and the energies of the government were taxed to the utmost to suppress it, but were eventually crowned with complete success. Never did British soldiers exhibit equal heroism, both physical and moral. From 1855 to 1865 (excepting for a brief interval, when lord Derby returned to office), the government was in the hands of lord Palmerston. During this period England carried on a successful war against China, and the volunteer movement was begun. The American war caused great distress among our operatives. In 1861 prince Albert died. In 1866 earl Derby was at the head of affairs: Britain was united to America in that year by the submarine telegraph, and the Fenian insurrection occurred. The year 1867 was marked by the passing of a conservative reform bill, which added more than half a million electors to the constituency of Great Britain; and by the expedition against Abyssinia, under sir Robert Napier, which, in 1868, resulted in the destruction of Magdala, and death of king Theodore. During the government of Mr. Disraeli, who succeeded lord Derby, Scotch and Irish reform bills were passed, and an act discontinuing public executions. In 1869 Mr. Disraeli having resigned, an act was passed by the liberal government under Mr. Gladstone, for disestablishing the Irish church. The years 1870 and 1872 produced the education acts for England and Scotland. In 1873—1874 the Ashantee (q.v.) war was carried on to a successful termination; and the latter year witnessed the establishment of a conservative government under Mr. Disraeli.

GREAT BRITAIN, Royal Arms of. The arms of the united kingdom of Great Britain and Ireland are borne by her majesty queen Victoria. Quarterly, first and fourth gules, three lions passant gardant in pale, or, for England; second, or, a lion rampant within a double tressure flory counterflory gules, for Scotland; third azure, a harp or, stringed argent, for Ireland; all surrounded by the garter.

Crest.—Upon the royal helmet, the imperial crown proper, thereon a lion statant gardant or, imperially crowned, also proper.

Supporters.—Dexter, a lion rampant gardant or, crowned as the crest. Sinister, a unicorn argent, armed crined, and unguled or, gorged with a coronet composed of crosses patée and fleur-de-lis, a chain affixed thereto, passing between the fore legs, and reflexed over the back, also or.

Motto.—*Dieu et mon Droit* in the compartment below the shield, with the union rose, shamrock, and thistle ingrafted on the same stem.



Royal Arms of Great Britain.

Arms have been ascribed by heralds to the Saxon and Norman monarchs of England in the 10th and 11th centuries; but as heraldry was, in point of fact, unknown till the middle of the 12th c., they must be dealt with as fabulous. However, at a period almost before the earliest dawnings of hereditary coat-armor, the sovereigns of England, in common with various other monarchs of christendom, adopted the lion as their device. Richard I., in his earliest seal, has two lions, which are borne counter-rampant; but in the latter part of his reign, after his return from the third crusade, the great seal of cœur-de-lion represents the three lions in pale and passant gardant, as they have been almost uniformly depicted since. The only subsequent instance of which we are aware of any variation in the number is on a seal of the Carmelites at Oxford, in which Edward III. is represented in a surcoat charged with four lions in pale passant gardant, a proof of the latitude which heralds occasionally allowed themselves as late as the beginning of the 14th century. In 1340 Edward III., in virtue of the supposed right of his mother, assumed the title of king of France, and quartered the arms of France with those of England, giving to the former the precedence. The fleurs-de-lis were then generally borne *sans nombre;* but in the latter part of the reign of Henry IV. they were reduced to three, borne or on a field azure. No further change took place in the royal escutcheon until the time of James I., except that Mary, on her second great seal, made after her marriage with Philip II., impaled the arms of Spain and England.

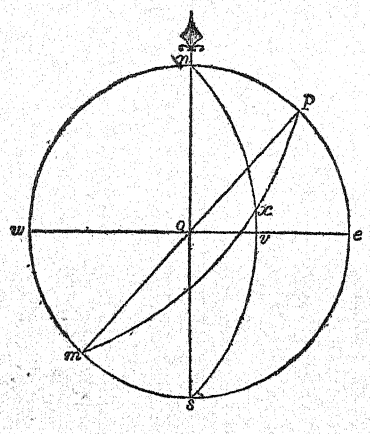
James VI. of Scotland, on succeeding to the throne of England, quartered the arms borne by preceding sovereigns with those of Scotland and Ireland, the first and fourth

quarters being France and England quartered as before, the second quarter the lion rampant of Scotland within the double tressure (see SCOTLAND, ARMS OF), and the third quarter the harp of Ireland (see IRELAND, ARMS OF). The royal arms were similarly borne by all the sovereigns of the house of Stuart till the reign of Anne, except that William III. bore over all the coat of Nassau (az. semé of billets, a lion rampant or) on an escutcheon of pretense. In the reign of Anne, the legislative union with Scotland brought about a material change. England and Scotland impaled were placed in the first and fourth quarter, France in the second, and Ireland in the third. The accession of George I. displaced England and Scotland from the fourth quarter, to make way for the arms of his majesty's German dominions. These were gu. two lions passant gardant in pale for Brunswick, impaled with or, semé of hearts gu. a lion rampant az., for Lüneburg, having the arms of *ancient* Saxony—viz., gu. a horse courant ar. enté en base, and in a shield surtout gu. the crown of Charlemagne proper, being the badge of the arch-treasurer of the holy Roman empire. A further alteration took place on the union with Ireland, when George III. laid aside the titular assumption of king of France, and abandoned the French ensigns. The arms of England were now made to occupy the first and fourth quarter, Scotland the second, and Ireland the third, while the German ensigns were relegated to an escutcheon of pretence. These last were finally abandoned on the severence of Hanover from the crown of Great Britain, which took place on the accession of queen Victoria, and the royal escutcheon thus assumed its present arrangement.

From the union of the crowns of England and Scotland under James I., up to the union of the kingdoms in 1707, the royal arms were somewhat differently marshaled in Scotland, Scotland being allowed in all Scottish seals, ensigns, and arms to occupy the first and fourth quarter, and England the second, while the whole were ensigned with the crown of Scotland; but the act of union of 1707 recognizes no royal ensigns but those of the United Kingdom, which are to be "such as her majesty shall think fit;" and by 39, 40 Geo. III. c. 67, on the union with Ireland, it was enacted that the armorial bearings of the United Kingdom "shall be such as his majesty by his royal proclamation under the Great Seal of the United Kingdom shall be pleased to appoint." The practice, which prevails to a certain extent in Scotland, of giving the precedence to the Scottish lion in the royal shield, is incorrect, though the error has been committed in several of the official seals of the kingdom.

The lion passant as the *crest* of England first appears on the Great Seal of Edward III.

The *supporters* borne in former times by the kings of England varied much, particularly during the earlier period when these appendages of the shield were invested with more of a decorative than a heraldic character, and perhaps often left to the fancy of the engraver. When the arms of any of the English sovereigns from Richard II. to Edward IV. are represented with supporters, the animals selected are almost indifferently lions, antelopes, or white harts, and occasionally their place is supplied by angels. Edward IV.'s shield is sometimes supported on one side by a black bull, and Richard III.'s in one instance—in a MS. in the British museum—on both sides by white boars. During the reigns of Henries VII. and VIII., Edward VI., Mary, and Elizabeth, the lion, red dragon, and greyhound were the supporters most in vogue, and as the herald or engraver had it not in his power to represent all three at once, he seems to have been allowed to select any two at pleasure. James I. for the first time clearly defined the royal supporters, adopting the lion of England and unicorn of Scotland as they have ever since been borne, the unicorn having been, up to 1707, allowed the precedence in Scotland.



the computation of a spherical triangle. under the head of SPHEROGRAPH (q.v.).

GREAT CIRCLE or TANGENT SAILING. In order to have a clear idea of the advantages of great circle sailing, it is necessary to remember that the shortest distance between two places on the earth's surface is along an arc of a great circle (see SPHERE), for instance, the shortest distance between two places in the same latitude is not along the parallel of latitude, but along an arc of a circle whose plane would pass through the two places and the center of the earth. The object, then, of great circle sailing is to determine what the course of a ship must be in order that it may coincide with a great circle of the earth, and thus render the distance sailed over the least possible. This problem may be solved in two ways, either by means of an instrument called the "spherograph," or by The first of these methods will be explained The method by computation will be under-

stood from the accompanying diagram: *nwse* represents a meridian which passes through the place *p*, *nxes* another meridian through the place *x*, and *pxm* a portion of a great circle; let *p* be the place sailed *from*, and *x* the place sailed *to*, then *px* is the great circle track, and it is required to determine the length of *px* (called the distance), and the angle *xpe* which it makes with the meridian (called the course). To determine these two, we have three things given: *nx*, the co-latitude of *x*; *np*, the co-latitude of *p*; and the angle *xnp*, which, measured along *we*, gives the difference of longitude. The problem thus becomes a simple case of spherical trigonometry, the way of solving which will be found in any of the ordinary treatises on the subject of spherical trigonometry.

From the theory of great circle sailing, the following most prominent features are at once deduced: *A ship sailing on a great circle makes straight for the port, and crosses the meridians at an angle which is always varying*, whereas, by other sailings, *the ship crosses all meridians at the same angle*, or, in nautical phrase, *her head is kept on the same point of the compass*, and *she never steers for the port direct till it is in sight.* As Mercator's chart (q.v.) is the one used by navigators, and on it the course by the ordinary sailings is laid down as a straight line, it follows, from the previous observations, that the great circle track must be represented by a curve, and a little consideration will show that the latter must always lie in a higher latitude than the former. If the track is in the northern hemisphere, it lies nearer the north pole; if in the southern hemisphere, it is nearer the south pole. This explains how a curve line on the chart represents a shorter track between two places than a straight line does; for the difference of latitude is the same for both tracks, and the great circle has the advantage of the shorter degrees measured on the higher circles of latitude. Consequently, the higher the latitude is, the more do the tracks differ, especially if the two places are nearly on the same parallel. The *point of maximum separation*, as it is called, is that point in the great circle which is furthest from the rhumb-line on Mercator's chart. Since the errors of dead-reckoning (q.v.) prevent a ship from being kept for any length of time on a prescribed track, and thus necessitate the calculation of a new path, in practice, the accurate projection of a great circle track on the chart would be a waste of time. In general, it is sufficient to lay down three points—the place sailed from, the place sailed to, and the point of maximum separation, and through these points to draw an arc of a circle. As the rhumb-line and great circle track between two places, one in north latitude and the other in south latitude, cross each other at the equator, in this case there will be two *points of maximum separation*, and the course and distance must be calculated for each side of the equator separately. Many ignorantly object to great circle sailing on the ground that, on account of constant change of bearings, a ship cannot be navigated on the correct course; but, in fact, all that is required of a navigator is to sail as near to his great circle track as convenient; and each separate course will be a tangent to his track, and the shorter these tangents are made, the more will the length of a voyage be diminished. We may here mention that a chart constructed on the *gnomonic projection* (q.v.) represents all great circle tracks as straight lines. See NAVIGATION.

GREAT EASTERN. The mightiest ship in the world has had an eventful history, marked in its earlier years by a large share of disaster. In 1852 an "Eastern Steam Navigation Company" was formed, to maintain an ocean steam-route to the east round the cape of Good Hope. In 1853 the directors came to a conclusion that, owing to the cost of maintaining coaling-stations on the way, such a route would not pay unless the ship could carry coal enough for the voyage out and home, besides a large number of passengers and a great cargo. Mr. Brunel was employed to plan, and Mr. Scott Russell to build, a vast steamer that would meet these requirements. The scheme was for a ship that would accommodate 1000 passengers, 5,000 tons of merchandise, and 15,000 tons of coal for fuel. Its arrangements (setting aside later alterations) were briefly as follows: Length, 680 ft. between perpendiculars, or 692 ft. upper deck; breadth, 83 ft., or 118 over paddle-boxes; height of hull, 60 ft., or 70 to top of bulwarks. Bottom flat for 40 ft. in width, without keel. Framework of 35 ribs or webs of plate-iron, 3 ft. deep, immensely strengthened, and extending from end to end of the ship, at 3 to 5 ft. apart; and cross-webs, of similar strength, connecting these at intervals. A double wall or skin of iron plate, outside and inside those ribs, thereby converting the whole hull into a cellular structure, like the top and bottom of the Menai Britannia tubular bridge. The plates for this purpose were 10,000 in number, some of them 28 ft. long. The cellular structure was continued along the bottom and about 5 ft. up the side, and any one of the cells thus formed could be filled with water. Ten partitions of plate, cross-wise of the ship, divided the interior into 11 water-tight compartments, further sub-divided by longitudinal partitions. The propelling power comprised both paddle and screw. The paddle-engines had 4 boilers, each with 400 brass flue-tubes; there were 4 engines (made by Scott Russell at Millwall), with cylinders of 14 ft. stroke, and 74 in. diameter; the paddle-wheels were 56 ft. diameter by 13 deep, with 30 spokes or radii. The screw-engines (made by Boulton and Watt at Soho) had 6 boilers; the 4 engines had cylinders, each 4 ft. stroke by 84 in. diameter, with piston-rods 7½ in. thick; the propeller-shaft was 160 ft. long, and in some parts 24 in. diameter, with a screw propeller at one end 24 ft. in diameter. The coal-bunkers, to supply all the furnaces, would contain 14,000 tons; the smoke from the furnaces ascended 5 funnels, 100 ft. high by 6

in diameter; each of the 10 boilers, when full of water, weighed 100 tons; the steam was conveyed from the boilers to the engines through a pipe 45 in. diameter. Setting aside the nominal power, all the 8 engines, at full force, were estimated to work up to 11,000 horse-power. There were 6 masts, 5 of them iron, carrying 7,000 yards of sail as auxiliary to the steam-power; the masts, yards, gaffs, and large spars were mostly of iron plate, strengthened inside in various ways; the shrouds and standing-rigging were of iron-wire ropes; the anchors, 10 in number, were some of them 10 tons each; the chain-cables were, collectively, a mile long, with links of 50 lbs. each. The vast wall-sided compartments of the ship had facilities for conversion into cabins for 800 saloon passengers, 2,000 second-class, 1200 third-class, and 400 officers and crew; or 5,000 might have been accommodated in all, if emigrants or troops. The height of the 'tween decks was 13 ft.; and all, whether for first, second, or third class passengers, were more lofty than known in any other ship. Such were the plans for the mighty ship; they were never fully carried out in all their details, owing to numerous alterations and refittings; nevertheless, the description faithfully conveys an idea of the general characteristics. The curvatures of the hull, in length, breadth, and height are shown by diagrams in SHIP-BUILDING.

Twenty years of the ship's history present a singular series of vicissitudes. During 1854–57, the operations proceeded at Millwall, under frequent and heavy financial pressure, which taxed the resources of the company severely; while the engineer and builder were frequently called upon to surmount difficulties of almost unparalleled kind. By Nov., 1857, the ship had advanced to the launching condition. In order to avoid the danger of launching such a long vessel stern foremost, the ship was built with the broadside towards the river, on a timber foundation of immense strength, with sloping ways, or rails, down to the water. Either the ship was too heavy (12,000 tons), or the slope was too gradual; for it required various attempts, between Nov. 3, 1857, and Jan. 31, 1858, and an expenditure of £60,000, to effect the launching. During 1858 and 1859, the work continued as fast as the company could supply money. Uncertain how far the original intention of a trade to and from Australia could be realized, the directors determined on a trial trip across the Atlantic. It was a disaster. The ship left the Thames, Sept. 8, 1859; an explosion of steam-pipes took place off Hastings; seven persons were killed and several wounded; and the voyage abruptly came to an end at Weymouth. Mr. Brunel died immediately after his vast ship had made this her first but futile attempt to brave the ocean. After a winter and spring spent in costly repairs, acrimonious recriminations, and suits in law and equity, the ship started again on June 17, 1860. Leaving Southampton on that day, she crossed the Atlantic in 11 days, and reached New York on the 28th. During the remainder of 1860, and the greater part of 1861, she made many voyages to and fro, losing money by the insufficiency of the receipts to meet the current expenses, and constantly required repairs. In Dec., when political relations with the United States looked ominous, the *Great Eastern* served as a troop-ship, carrying some battalions of foot guards over to Canada with a degree of comfort never before experienced by 2,000 human beings in one ship.

The years 1862 to 1864 were nearly a blank as concerns the history of the *Great Eastern*. No attempt was made at a voyage to Australia and back; the trips across the Atlantic had not been remunerative; the government did not often require the services of so vast a fabric as a troop-ship; and the company were always embarrassed by overhanging debts. In 1864 negotiations were entered into with the Atlantic Telegraph company and the Telegraph Construction and Maintenance company, for the employment of the *Great Eastern* as a cable-laying ship. The passenger accommodation was wholly removed from the interior, to make room for the enormous iron tanks in which the cable was stowed. The arrangement and services of the ship in 1865 and 1866 will be found briefly noticed under ATLANTIC TELEGRAPH. In 1867 when the Paris international exhibition was approaching completion, a body of speculators chartered the *Great Eastern* for a certain number of months, to convey visitors from New York to Havre and back again—under the expectation that the number of such visitors would be so vast as to defray the whole of the expenses, and yield a large profit. A great outlay was incurred to reconvert the vessel from a cable-laying to a passenger ship, and for extensive renewals of machinery. The ship started from Liverpool for New York in May; but the speculation proved an utter failure, there being neither wages for the seamen and engineers, nor profit for the speculators.

In 1868 a new arrangement was made, by which the ship was to be permanently chartered by the Telegraph Construction and Maintenance company. The name, which had been changed from *Leviathan* to *Great Eastern*, and then to *Great Ship*, was again changed to *Great Eastern*. The passenger fittings, introduced in 1867, were removed, and everything arranged for the important work of submarine cable-laying. This has proved to be an advantageous mode of employment. Between 1869 and 1874 the *Great Eastern* successfully laid some of the most important telegraphic cables—across the Atlantic, in the Mediterranean, in the Red sea, across the Indian ocean, across the equator from Europe to Brazil, etc.

GREAT FALLS, a village partly in the town of Somersworth, in Stratford co., N. H., but reaching over into Maine, on the Portsmouth, Great Falls and Conway, and

a branch of the Boston and Maine railroads, 5 m. n. of Dover; pop. estimated at 4,000. The cotton factories employ 3,000 persons, and use yearly 7,700 bales. There are also woolen and other manufactories, a town hall, high school, etc.

GREAT FISH RIVER is the name of two streams in opposite extremities of the British empire.—1. Great Fish river in Cape Colony rises in the Snowy mountains; and, after a generally south-eastern course of 230 m., it enters the Indian ocean, in lat. 33° 25′ s. and long. 27° e., having at its mouth a bar, which renders it inaccessible to any decked vessel.—2. Great Fish river of British North America, known chiefly as the route of Back and King in search of Ross, enters an inlet of the Arctic ocean, in lat. 67° 8′ n., and long. 94° 40′ w., after a n.e. course, the length of which, however, has not yet been ascertained. Its character is as unfavorable as its position to navigation and commerce.

GREAT GRIMSBY. See GRIMSBY, GREAT, *ante*.

GREAT KANAW'HA, a considerable river of North America, and an affluent of the Ohio, is called New river in the upper part of its course, and rises in the n.w. of the state of North Carolina, between Blue ridge and Iron mountain. It flows first n.e. for upwards of 100 m. between parallel mountain-ranges, then turning n. and n.w., it breaks through several ridges of the Alleghanies, and continues to flow in a n.w. direction to its junction with the Ohio at Point Pleasant, after a course of about 400 miles. About 100 m. from its mouth, on being joined by the Gauley river, it takes the name of the Great Kanawha; and 2 m. lower, its course is marked by a remarkably picturesque fall of about 50 feet. Up to this fall, the river is navigable.

GREAT MAR'LOW, a municipal and parliamentary borough in Buckinghamshire, finely situated on the n. bank of the Thames, in lat. 51° 34′ n., and long. 0° 46′ w., 31 miles n.w. of London. The Thames is here crossed by a suspension-bridge (constructed in 1835), which has a span of 225 feet. The principal manufactures are silk, lace, and paper. Great Marlow returns one member to parliament. Pop. in '71, 6,627.

GREATOREX, ELIZA, b. Ireland, 1820, daughter of J. C. Pratt, a Wesleyan minister; wife of Henry W. Greatorex, son of the organist of Westminster abbey. She came to America in 1839. In 1854–56 she studied painting in New York, and in 1862 studied in Paris. In the interim she visited Ireland and England. About 1868 she began a series of sketches of historical edifices and scenes in and around New York. She was in Germany in 1870 and the following years, where she published *The Homes of Oberammergau*. Returning to the United States she published *Summer Etchings in Colorado*, and other works. Her latest work contains illustrations inland near New York.

GREAT PEDEE RIVER. Its sources are in the Alleghany mountains in n.w. North Carolina, whence it flows s.e., under the name of the Yadkin river, till its junction with the Rocky river in the s. part of the state; then, under the name of the Great Pedee, continues in a s.e. direction through South Carolina, receiving the affluents Little Pedee and Waccamaw, and empties into Winyaw bay. It is navigable for steamboats to Gardner's bluff, over 100 m. from its mouth, and for sloops 150 m., to the falls at Cheraw.

GREAT SALT LAKE, a remarkable and extensive sheet of water in the n. of Utah territory, North America, has given name to the Salt Lake city (q.v.), the Mormon metropolis, which is situated at its south-eastern extremity. It lies in one of the great valleys or basins of the Rocky mountains, and is about 70 m. long and 30 m. broad, yet its average depth is only 7 or 8 ft., and it nowhere exceeds a depth of 33 feet. Its surface is 4,200 ft. above the level of the sea. In the middle of the lake several islands rise as high as 3,250 ft. above the level of the water; the principal island is in lat. 41° 10′ n., and long. 112° 21′ west. The islands are 9 in number, one of them is 12 m., and another 16 m. in length. The water of the lake is so salt as to form one of the purest and most concentrated brines known in the world. It contains 22 per cent of chloride of sodium, slightly mixed with other salts. This lake, in whose waters no living creature is found, receives from the s., by the Jordan, the waters of the Utah lake, which are fresh, and those of the Wear river from the n.; but it has no outlet. It has been called the "still innocent dead sea;" and certainly in the quality of the water, and the wild, weird aspect of the surrounding scenery, the lakes greatly resemble each other. The first mention of the Great Salt Lake was by baron La Hontan, in 1689, who did not himself visit it, but who gathered some notions of it from the Indians w. of the Mississippi. It was first explored and described in 1843, by col. Fremont. A thorough survey was made in 1849–50, by capt. Howard Stansbury, of the U. S. army, whose report was printed in 1852. See SALT LAKE CITY, and UTAH.

GREAT SEAL. By act of union between England and Scotland (5 Anne, c. 8), one great seal for the United Kingdom of Great Britain is used for sealing writs to summon parliament, for treaties with foreign states, and all public acts of state affecting Great Britain. The holder of the great seal is now generally called the lord chancellor. A seal is also kept in Scotland for sealing grants and writs affecting private rights there. By the law of England, the lord chancellor has the custody of lunatics, which is a *quasi* judicial power; but he has no authority to act in this capacity in Scotland, where a

similar authority is vested in the court of session. As regards Ireland, the act of union, 39 and 40 Geo. III., c. 67, provided that various acts as to summoning parliament, etc., should be done under the great seal of the United Kingdom; but in other respects, the great seal of Ireland is used in the same manner as before the union.

GREAT SLAVE LAKE, an extensive and irregular sheet of water in British North America, is situated in lat. between 60° 40′ and 63° n., and in long. between 109° 30′ and 117° 30′ west. Its greatest length is about 300 m., and its greatest breadth 50 miles. It is surrounded, especially on the n., by rugged and precipitous shores; it contains many islands, some of them wooded, and is wholly frozen over for six months of every year. On the n., it receives the surplus waters of lake Aylmer and lake Artillery, and on the s., those of lake Athabasca. Its own surplusage of water is carried off by the Mackenzie river to the Arctic ocean.

GREAT SLAVE RIVER, a river of British North America, forms the outlet of lake Athabasca into Great Slave lake, and flows in a n.w. direction from the former to the latter. It is about 300 m. in length; its banks in many parts are well wooded; and its course, which in the upper part is interrupted by falls and rapids, lies through an alluvial region in the lower part.

GREAT WALL OF CHINA. See CHINESE EMPIRE.

GREAVES (Fr. *grève*), pieces of armor formerly used as a defense for the legs (in the patois of Burgundy, *grève* still signifies "shin.") They were originally made of leather, quilted linen, etc., and afterwards of steel, hollowed to fit the front of the legs, and fastened with straps behind. The Greeks termed them *knēmides* (whence the frequent expression in the *Iliad, euknēmides Achaioi*, the "well-greaved Greeks"), and the Romans *Ocreæ.*

GREAVES, JOHN, 1602–52; b. England; educated at Oxford, and lecturer on geometrical science in a London college. He traveled in Europe and Egypt with a view of studying the pyramids, and in his journey collected many valuable manuscripts, gems, and coins. He was subsequently a prof. of astronomy at Oxford. Among his works were a *Discourse on the Roman Foot and Denarius,* a Persian grammar, and an unfinished dictionary of the same language.

GREBE, *Podiceps*, a genus of birds of the family *Colymbidæ*, having the feet webbed not in the usual manner, but by a separate membrane for each toe, united only at the base. The tarsi (shanks) are so much compressed as to be almost like blades. The claws are large and flat. The bill is about as long as the head, straight, and conical. The wings are short. There is no tail. The legs are attached so far back, that the birds when on land assume an erect position, like penguins. They walk with difficulty, and all their motions on land are awkward. They sometimes shuffle along on their bellies like seals. But in water they are extremely agile; they swim rapidly, dive with extreme quickness if alarmed, and pass to very considerable distances under water, moving there by means of their feet alone, and threading their way with wonderful expertness among the stalks and leaves of aquatic plants. They feed on fishes, batrachians, crustaceans, and other aquatic animals, partly also on vegetable food. They are said sometimes to carry their young under their wings, and even to take them under water with them in diving to escape from enemies. The geographical distribution of the genus is very wide, and some of its species are also very widely distributed. Four species are British, two of which are only winter birds of passage; but the GREAT-CRESTED GREBE (*P. cristatus*), and the LITTLE GREBE (*P. minor*), also called DABCHICK or DOBCHICK, are resident all the year. The little grebe is by far the most common British species. It does not exceed 10 in. in length. The great-crested grebe is rare, even in winter, when the number is increased by visitants from the north. It is sometimes called the SATIN GREBE, from the beautiful shining silvery feathers of the lower parts of its body, on account of which it is in great request, the skin being used to make muffs for ladies, or cut into narrow strips for trimming their dresses. Grebe-shooting is a favorite amusement on the lake of Geneva; the grebe is pursued by a boat, whilst it seeks to escape by diving and swimming under water. The males of some of the grebes have the head finely ornamented with tufts. The plumage of most of them varies much at different ages and seasons.

GRECIAN ARCHITECTURE. The origin of the architecture of Greece is, like the origin of every art and science in that country, mixed up with mythical and fabulous history. It is divided into three styles, and each of these has its mythical origin. Thus, the Doric is said to have been copied from the early wooden huts of the aborigines; the Ionic, which sprang up among the Greek colonists in Asia Minor, to have been modeled on the graceful proportions of the female figure, as the Doric had been on the more robust form of a man—the volutes representing the curls of the hair, the fluting of the folds of the drapery, etc. The story of the origin of the Corinthian style is very pretty: a nurse had deposited in a basket on the grave of a departed child the toys she had amused herself with when alive. The basket was placed accidentally on the root of an acanthus, and in spring, when the leaves grew, they curled gracefully round the basket, and under a flat stone which was laid on the top of it. Callimachus, the sculptor, see-

ing it, caught the idea, and worked out at Corinth the beautiful capital since called after that city.

Modern discoveries have, however, shown that Greece owed much to the earlier civilization of the countries which preceded it in history. To the architecture of one or other of these, almost every feature of Greek architecture can be traced. But it is for the first idea only that the Greeks are indebted to Egypt and Assyria; whatever forms they adopted, they so modified and improved as to make them part of their own architecture.

Grecian architecture is divided into three styles—the Doric, Ionic, and Corinthian (see COLUMN, figs. 4, 5, 6). Of these the Doric is the oldest. The earliest example which remains is the temple at Corinth, which was built about 650 B.C. The remains of this temple show the various members of the style fully developed, but they are all of a massive and heavy description, strongly resembling in this respect their prototype, the architecture of Egypt. There is now no doubt, although the intermediate steps are lost, that the Doric style took its origin from the rock-cut tombs of Beni-Hassan (q.v.) in Egypt. The pillars of one of these tombs appear at first sight to be Doric; it is only on close inspection that we find that the Echinus (q.v.) is wanting under the capital. The echinus was, however, used by the Egyptians. We here find ourselves in the cradle of Greek art. This is the spot where we must seek for the first origin of the style, not in Greece, where the earliest example is already complete in all its parts. The earlier the example, the more massive the form. This completely disproves the theory, that the pillars were copies of stems of trees used as posts. It seems more likely that the first pillars were square piers of rubble or brick-work, with a flat stone or tile laid on the top, to form a good bed for the beams to rest on. These formed the architrave, stretching from pier to pier, on which rested the cross-beams supporting the rafters of the roof, the ends of the latter suggesting the dentils and modillions (mutules) of the cornice, the former, the triglyphs (see ENTABLATURE). The square form of the pier was afterwards modified by cutting off the corners, and again cutting off the remaining corners, until the polygon suggested the fluted shaft. The same process was afterwards gone through by the mediæval architects in developing the piers (q.v.) of Gothic architecture.

After the temple at Corinth, the next remaining example is the temple at Ægina (q.v.), built about a century later, or 550 B.C. There may have been many temples of the same date, but none now exist; they were probably destroyed during the Persian war, or removed to make way for finer buildings during the great building epoch of Greece which succeeded that war, and when she was at the summit of her power. Of this epoch, we have many remains. The temple of Theseus and the Parthenon at Athens (438 B.C.), that of Jupiter at Olympia (440 B.C.), Apollo Epicurius at Bassæ, Minerva at Sunium, and all the best examples of the Doric style of Greece, are of the age of Pericles. Besides the Peloponnesus, there are the countries colonized by the Greeks to which we can look for remains of Greek architecture. The Dorian colonists of Sicily and Magna Græcia carried with them the architecture of their native country, and furnish us with many fine examples. In Selinus there are six temples, the oldest being about the same age as that at Corinth. At Agrigentum there are three Doric temples, one of them founded by Theron (480 B.C.); this is the largest Grecian temple of the period, being 360 ft. long by 173 ft. broad. At Syracuse, Ægesta, and Pæstum there still remain many valuable examples.

As the Doric art progressed, the early massive forms gave place to more elegant and slender proportions. In the temple at Corinth the column is only 4.47 diameters in height; in the Parthenon, which is universally recognized as the finest example of the style, the column is 5.025 in height; and in later examples it becomes still taller and thinner, until it runs into the opposite extreme from which it started, and becomes so meager and attenuated as to lose entirely the boldness and vigor of design which are the chief characteristics of the style.

One thing to be particularly admired in the Doric style is the beauty of the sculpture with which it is adorned, and the appropriate manner in which the sculpture is placed in the building, and the building suited for the sculpture. It has been shown by Mr. Penrose that every line was the subject of the deepest study on the part of the architect, for the purpose of correcting and allowing for all optical aberrations. The result is, that there is hardly a single straight line in the building; all the lines, which appear to be perfectly straight, are drawn with accurate curves, so as to produce the smoothest and most pleasing effect to the eye. Every harsh angle is softened, and every disagreeable combination of lines avoided. For example, the columns have an Entasis (q.v.) or slight swelling formed by a hyperbolic curve; the architrave of the front is curved upwards, so as to correct the optical illusion caused by the sloping lines of the pediment, and the columns are sloped slightly inwards, so as to give greater appearance of solidity.

The Parthenon is built entirely of white marble, and the whole of the masonry in this, as in other Doric works of importance, is put together with the most perfect workmanship.

There seems to be no doubt that this and other Greek temples were adorned externally with color. To what extent this decoration was carried, is not clearly ascer-

tained; but it is probable that the exterior walls were covered with historical pictures, which were sheltered from the effects of the weather by the portico surrounding the temple. The sculpture was probably also relieved by a flat color on the background, and the moldings decorated with painted or gilded ornaments.

Ionic.—This style took its rise about 500 B.C., and as we have seen that the earlier Doric was imported from Egypt, so the Ionic seems to have originated from the influence of Assyrian art. The recent discoveries of Layard and others have shown that many of the characteristic ornaments of the style were in common use in Assyrian architecture. The volutes of the capitals are particularly indicative of an eastern origin, the scroll being an ornament of very common use in all eastern art.

The finest examples of the Ionic style remaining in Greece are the temples of the Wingless Victory (*nikè apteros*) and the erechtheum at Athens, built about 450—420 B.C. In the Ionian and other colonies of Asia Minor, also, many fine examples of this style were erected. The celebrated temple of Diana at Ephesus was of the Ionic order. It was the largest temple we know of up to its time, being 425 ft. long by 220 ft. wide. No trace of it now remains.

The Ionic is a graceful and elegant style, but not so pure and severe as the Doric. The latter is distinguished by simple and beautiful outline, enriched with the most perfect sculpture; the former trusts rather to ornamental carving for its effect. This love of elaborate ornament is an indication of the eastern influence under which the style originated, and the moldings and many of the ornaments are found to be identical with those of Assyrian architecture, only refined and simplified by the Greeks. The honeysuckle ornament, so commonly used both in Assyrian and Ionic architecture, is a good example of the improvement effected by the Greeks on the original type. In the Ionic as well as in the Doric, we find the most perfect execution and workmanship, the spirals, entasis, etc., being all drawn and cut with the greatest possible exactness.

Corinthian.—This style was the latest introduced, and combines, to some extent, the characteristics of both the preceding. It unites and blends together the Egyptian and Assyrian elements, the cap being probably derived from the bell-shaped capitals of the former country, ornamented with the carved leaves and spirals of the east. This order was first used about the time of Alexander the Great, the earliest example extant being the Choragic monument (q.v.) of Lysicrates (335 B.C.). There are also the temple of the winds and that of Jupiter Olympius at Athens, the latter being one of the largest and finest examples of the style.

The Corinthian is the most florid of the Greek styles, and although invented by the Greeks, it was not brought into use till after the power of the republics, to which we owe the finest works of Greek art, had begun to wane. This style, from its richness and splendor, became afterwards the greatest favorite with the Romans, in whose hands Greek art became spread over the whole empire.

Caryatides.—Besides the above styles, which constitute *the Greek orders* of classic writers, the Greeks also used *caryatides* (q.v.), or female figures, in place of columns, as in the erechtheum and *telamones* (q.v.), or giants, as at Agrigentum. These were probably derived from the figures used by the Egyptians in their architecture, but the latter never used them as columns; they always placed them as statues in front of the columns.

Greek temples are technically classed and designated by the mode in which the columns of the porticoes are arranged. The *cell*, or temple proper, is a square chamber contained within four walls; the simplest form of portico is called *distyle in antis*, the two side-walls being continued past the end-wall, and terminated with antæ, or pilasters, with two columns between.

When the portico has four columns between the antæ, it is called tetrastyle.

The temples have generally the same arrangement at both ends.

In front of both ends of the plan *distyle in antis*, there is frequently placed a range of six columns, and from the flank columns a row is continued along both sides. Such an arrangement is called *peripteral*, and the temple is designated hexastyle and peripteral. This was a common arrangement.

The Parthenon is an exception to the general rule: it has a hexastyle portico at each end of the cell, in front of which is placed an octostyle portico, and seventeen columns at each side.

The great temple at Agrigentum had seven columns at each end, and fourteen at each side, and was peculiar in having the space between the columns all round filled up with a wall. The reason probably was, that the space between the columns was too great to be spanned by architraves in single stones. The wall was pierced with windows.

Considerable doubt has existed as to the mode adopted by the Greeks for lighting the interior of their temples; that suggested by Mr. Fergusson seems the most probable, as being similar to the plan used by the Egyptians and Assyrians. The interior had generally a double row of columns, one over the other, dividing the width into three spans. This arrangement still exists in the temple of Neptune at Pæstum. Mr. Fergusson supposes that the light was introduced by counter-sinking a part of the roof, so as to admit the light between the pillars of the upper range, thus forming a kind of

clerestory. Windows, however, were also used, as in the temple at Agrigentum and in the erechtheum.

The theaters of the Greeks formed another very important class of works; they consisted of semi-circular rows of seats cut in the rock, or partly built. Remains of these structures are found in all the countries inhabited by the Greeks, and were frequently of great size—that at Dramyssus being 443 ft. across. The proscenia were the parts on which architectural design was chiefly displayed; but these have unfortunately all perished.

None of the palaces or domestic edifices of the Greeks remain to us; we are thus totally deprived of a very interesting chapter in the history of domestic architecture, for it is highly probable that the streets and houses of Greece, although not so splendid and enduring as the temples, were more varied in style, and exhibited many picturesque and beautiful forms, which are now entirely lost.

The attempt has been made in modern times to revive Greek architecture, and some ingenious modifications and adaptations of it have been carried out. But it was found that this style, so beautiful and appropriate in the warm and genial climate of Greece, was quite unsuited for our northern latitudes. The porticoes are useless in a climate where external painting cannot last, and where the sunshine is courted rather than excluded; the pitch of the roof is not high enough to throw off our snows; and windows of sufficient size for our dark skies are not admissible. Grecian architecture has therefore been abandoned; and its place is now taken by a style more appropriate to our climate, and more suited to the feelings of the people.

GRECIAN GAMES. See GAMES, ANCIENT.

GREECE. The name by which the ancient Greeks delighted to call their native country was Hellas (q.v.). The terms Græcia and Græci were first used by the Romans, being derived probably from a small tribe in Epirus, near Dodona, called *Graikoi*, with whom the Romans may be supposed to have been, from proximity, best acquainted.

Extent, etc.—This country, so celebrated in the history of freedom, of literature, of art, of philosophy, and of civilization generally, varied much in size at different periods of its history. Hellas at first was applied only to a small district in Thessaly; at a later period it denoted not only the Morea, and what is commonly called Greece Proper, but also Macedonia, Epirus, and the islands of the Ægean.

Boundaries—(1) *Ancient*.—The northern limit of ancient Greece may be fixed about the 40th parallel of n. lat.; the s. extremity being in 36° 23′. The barrier separating Greece from Illyricum and Macedonia on the n. was that range of mountains which, starting from the Adriatic as the Ceraunian range, merges into the Cambunian ridge in the center, and runs out into the sea on the e. as the far-famed Olympus. The Ægean sea washes the country on the e., the Mediterranean on the s., and the Ionian and Adriatic on the west. The greatest length is about 250 English miles, and the greatest breadth 180; the area (not including Epirus, but including Eubœa) is about 21,000 sq.m. —i.e., about two thirds the size of Scotland. The Cyclades are reckoned by themselves, and amount to rather more than 1000 sq. miles. See *islands* at end of article. (2) *Modern*. The extent of modern Greece is much more limited. Its n. boundary was fixed in 1834 by a line drawn (in lat. 39° 8′ n.) from the gulf of Arta (Ambracia) in the w. to the gulf of Volo (Pagasæ) in the e., thus excluding the greater part of Thessaly and much of Acarnania, with all Epirus. The greatest length of this territory is not more than 200 English miles, and its superficial area, including Eubœa, but not the Cyclades, about 15,000 sq.m., or half the size of Scotland.

Physical Conformation.—Greece is essentially a country of mountains, hills, and valleys. From the ridge which forms its northern frontier, there starts in a southerly direction the Pindus chain, the backbone of Greeee, dividing Thessaly from Epirus, and giving origin to those numerous streams which water the mainland. About lat. 39°, it sends off two spurs to the e.; Othrys (Gura), which terminates at the gulf of Volo—and a little further s., Œta (Katavothra), at the extremity of which is the famous pass of Thermopylæ. Some ridges of less note run westward. From this point the great central chain extends in a s.e. direction (though with many windings), as far as mount Cithæron, and even through Attica as far as cape Sunium, under the names of Parnassus, Helicon, Cithæron, and Hymettus; while in a s.w. course we find many ranges crossing the country towards the Ionian sea and the gulf of Corinth (Lepanto), in a direction parallel with, or slightly inclined to, that of the central chain. The somewhat lateral range of Cithæron and Parnes, on the borders of Attica, is extended through Megaris into the Morea or Peloponnesus by a lower ridge, which, passing across the isthmus of Corinth, stretches even to the w. coast. Of this range, the two most conspicuous points are mounts Cyllene and Erymanthus, from which two chains run s. on the e. and w. of Arcadia respectively, and under the names Taygetus (Pentedactylon) and Parnon (Malevó), terminate in the promontories of Tænarus and Malea. Besides these, there are many shorter chains and individual peaks, which it would be tedious and out of place to detail. It may be sufficient to state, that there is no country of Europe, except Switzerland and the w. parts of Scotland, which can be compared to Greece in the extent, variety, and irregularity of its mountain system, and the number and character of its valleys. Of all the divisions of Greece, Arcadia is most like Switzerland in its

rugged nature and generally elevated surface. Some of the mountain peaks of Greece rise to a great height; thus, Olympus is 9,700 English feet, and is covered with snow; Guiona, on the frontier, 8,240 ft.; Parnassus, 8,001; with many others of 7,000, 6,000, and 5,000. Helicon is 4,963; Cithæron, 4,630; Cyllene, 7,745; while the Acrocorinthus, or citadel of Corinth, is 1869 above the level of the sea. The mountains of Greece are more remarkable for the suddenness of their rise than for their great elevation. So, too, there are many smaller peaks and cones notable for the abruptness with which they spring from the plain, such as the Acrocorinthus, the rock of Ithome, and the Meteora cliffs of Thessaly near the Peneus. These last are huge masses of rock standing out from the plain to heights varying from 100 to 300 or 400 ft., with sides perpendicular as a wall. They assume the shapes of pillars, cones, and other figures more or less regular; they cover a space of nearly two sq.m., the recesses between the pinnacles being filled with trees and dense brushwood. The summits are occupied by monasteries, the only access to which is by baskets, nets, or ladders swung in the air.

Minerals.—Greece is not rich in minerals: gold, silver, copper, lead, and iron, are found, but the mines have never been worked with zeal. The most famous mines in ancient times were those of Laurium in Attica. Coal is found in Eubœa and in some parts of the Peloponnesus; salt is procured in many districts of Greece and in the Ionian islands; and marble of the purest kind, and of various colors, may be had in endless amount in almost all parts of Greece. The most famed quarries were in Paros, Carystus (in Eubœa), Pentelicus, and Hymettus. Marble and building-stone were quarried by the old Greeks to a very large extent. There are many mineral springs, both cold and warm, and many caverns still emit those mephitic exhalations which in bygone days quickened the imagination of the poet, and confirmed the superstition of the peasant.

Plains and Valleys.—The valleys of Greece are very numerous, but owing to the great number and irregular courses of the mountain ranges, are very small. The two great plains are those of Thessaly and Bœotia, the former being the largest and the most fertile in all Greece: that of Messenia is both extensive and fertile.

Coast-line.—As Europe is pre-eminent among continents for the great extent of its sea-coast, so is Greece for a similar feature remarkable among the kingdoms of Europe. The bays are very numerous, and many of them run far up into the land, so that no part of the country is far from the sea—a circumstance which gives the inhabitants great facilities for commerce, and which leads the modern Greeks, as it did the ancients, to occupy themselves in very large numbers with maritime affairs.

Water-system—(1) *Rivers.*—The rivers of Greece necessarily follow its valleys in character. None of them are navigable. The most important stream is the Achelous (Aspropotamo), which rises in Mt. Pindus, flows in a s. direction through Epirus, and empties itself into the Ionian sea, at the mouth of the gulf of Corinth, after a course of about 130 miles. The Spercheus rises in the Pindus range, and disembogues into the Malic gulf, after traversing for more than 60 m. the fertile vale which is bounded on the n. by Mt. Othrys, and on the s. by Mt. Œta. Besides these, there are in n. Greece the Cephissus, rising in Doris, near the base of Mt. Parnassus, and flowing through the fertile Bœotian plain into lake Copais (Lago di Topoglia, or lake of Livadia); and in the s. part of Bœotia, the Asopus (Vuriemi). In Peloponnesus, the principal streams are the Eurotas (Vasilipotamo) and the Alpheus (Roufia). By the banks of this latter, the great Olympic games were celebrated. The rivers of Greece depend for their supplies mainly on the atmosphere; hence in summer the larger streams are greatly reduced in size, and the majority of the smaller ones are either almost or altogether dry channels. Many of them are nothing more than mountain torrents, or gulleys, which the heavy rains of autumn and winter fill for a short season.

(2) *Lakes.*—The many hill-encircled valleys of Greece, from which there is no outlet, afford the most favorable opportunity for the formation of lakes; hence the rains of autumn and winter stagnate in many cases in the valleys of the mountains, and for at least a part of the year, form tiny lakes or tarns. Some of these are permanent, though with great difference in depth of water, according to the season of the year, while others degenerate in summer into reed-grown marshes and pestilential fens. See Bœotia.

Climate.—The climate of Greece varies very considerably in different parts of the country. In the highlands of the interior, the cold in winter is often very severe, snow lying for several months. On the plains, and in the lower districts near the coast, snow is seldom seen; but the n. and n.w. winds are frequently very trying, though there is no intense cold. The summer heat is often excessive; and the sirocco not unfrequently visits the s. and lower parts. In moisture, too, there is much difference; thus, while Attica is remarkable for its pure air and beautifully bright sky, Bœotia has been famed from ancient times for the moisture of its climate and the fogginess of its atmosphere. The swampy valleys of lake Copais and other marshy tracts, when acted on by the scorching heat of a summer's sun, produce those noxious vapors which are found in so many parts of Greece, breeding malaria and disease. This defect seems to have increased since classical times, either from the greater thinness of the population, and the consequent diminution of tillage, or other causes not easily reached. But drainage would be an easy matter in a country whose rock-formation is of so soft a character as

that of Greece. Were its natural advantages aided by drainage and irrigation, Greece might yet become one of the healthiest and one of the most fertile countries of Europe.

Productions.—The more common products of Greek soil in ancient times were wheat, barley, and other cereals; flax, wine, and oil, with fruits of various kinds. The figs of Attica were and still are famed for the excellence of their flavor. Forests once covered many of the hills, and supplied timber for domestic purposes and for ship-building: they are still extensive in some parts. The most important productions of modern Greece are those mentioned above, with maize, rice, millet, currants, and silk. Honey is produced in great quantity on Hymettus and in some parts of the Peloponnesus The mulberry-tree is largely grown for the silk worm; and on the n. and s. shores of the gulf of Corinth, as well as in Arcadia, and the w. coast of the Peloponnesus, the Corinthian grape or currant is most extensively cultivated. Vines flourish in almost all parts, but the island of Santorin possesses the most famous vineyards, with the greatest variety of grapes, and furnishes a wine highly prized by the Russians. The olive grows in a wild state over all parts of Greece; when ingrafted, it yields an excellent fruit, which the inhabitants pickle in very large quantity, as a staple article of food. The oil of the olive serves to supply light, and is used in cooking and for food, as we employ butter. Cotton, madder, tobacco, and leguminous plants grow in considerable quantity. Fruit-trees are specially fertile; figs and apricots are plentiful and of excellent quality; oranges, citrons, lemons, pomegranates, almonds, water-melons, gourds, and others of less note are widely spread, largely produced, and of excellent quality.

Flora and Fauna.—The flora of Greece resembles that of other countries of s. Europe. Among the tame animals of ancient Greece were the horse, mule, ass, ox, sheep, goat, swine, dog. The swine supplied the favorite flesh meat. Of wild animals, we find the wolf, bear, boar, and even lions at an early period. Sheep and goats are still very plentiful, and in fact constitute one of the most important sources of wealth to the Greeks. Oxen are much used for plowing, but milch cows are little prized, and scarce. At the present day, the wolf, bear, lynx, wild-cat, boar, stag, roebuck, fox, jackal, badger, marten, and many other wild animals are found in the forests. Hares, snipes, wild-ducks, and other game are very abundant; while eagles, vultures hawks, owls, etc., are found in considerable numbers. The tortoise is very common, but the inhabitants have a great aversion to it.

Agriculture.—The agricultural implements are still as rude as in the days of the Peloponnesian war, or even of Hesiod; and this added to the scarcity of plowing oxen, ruggedness of the country, general thinness of soil, and difficulty of tillage and irrigation, is enough to damp the ardor of even a more energetic population. The houses of the country-people are in most parts little better than mere hovels, and a large proportion of the arable land is untilled. The modes of tillage are of the most primitive kind; and thus, though nearly half the male population of Greece is employed in agricultural labors, they make but slight impression on the general aspect of the country, and influence little the amount of exports; in fact, they do not produce as much grain as supplies the wants of the population, and that, too, though a higher yield is given in many parts of Greece than in this country. Much labor, however, is bestowed on the cultivation of the olive, vine, mulberry, and fruit trees. The greater part of the land belongs to the state; rent is paid in kind, and in a certain proportion (one-third) to the net produce. The proprietor is in very many cases obliged to furnish the *metayer*, or tenant, with seed to sow the ground, and with oxen to plough and prepare it; and as the *metayer* has an interest in the farm for only one year, there is little encouragement for either landlord or tenant to expend largely in improvements—such as drainage, fences, clearing of the soil, and comfortable farm-steadings. The country, however, is better suited for a pastoral than an agricultural people. Arcadia is still the land of shepherds, as it was of old. The flocks are driven to the valleys near the coast in winter, and in April to the hills.

Manufactures.—The manufactures are few and unimportant. Cotton and woolen stuffs, and some minor articles are made by the peasantry for domestic use. Ship-building is carried on at most of the sea-ports; and silks, gauze-stuffs, cutlery, hardware, earthenware, leather, saddlery, and such articles are made in small quantities in some of the principal towns, and more especially on the islands. The Greeks have great skill in embroidering in silk, gold, and silver; also in sculpture, and in the cutting of marble. Carpets are made in the island of Andro, and straw-hats at Lifanto. The modern Greeks are not behind their great ancestors in the art of dyeing in bright colors.

Commerce.—Every circumstance tends to make the Greek a man of commerce. He is of a quick, active, versatile, practical turn of mind, and possesses all those qualities which insure success in business. The bays and gulfs of the sea-indented shore allure him to the waters, while the strong currents and frequent squalls on his iron-bound coast soon render him an expert and fearless seaman. The islanders are thrown into a seafaring life even more than the people of the mainland. Greece occupies a position in the Mediterranean, which, for commercial advantages, cannot be surpassed. The exports of ancient times were of course mainly the products of the soil, the trees, and the mines; and the same do they remain at the present day. Raw produce, as cotton, corn, currants, figs, and other fruit, tobacco, olive-oil, honey, wax, gum, valonia bark, silk, and sponge are the most common. From western Europe manufactured goods of all kinds and the

produce of our colonies are largely imported; while Turkey, from her provinces in Europe and in Asia, supplies coffee, rice, timber, drugs, and other articles of eastern growth. The Greek merchants speculate largely in the grain trade. The principal sea-ports are Syra, Piræus, Patras, and Nauplia, and the ports with which they trade most are Constantinople, Leghorn, Trieste, Palermo, and Smyrna. The mercantile navy of Greece is very large, amounting to upwards of 6,000 vessels, many of 500 or 600 tons, but the majority are small craft, for short voyages from island to island, or to ports near Greece. It is as agents and carriers that the Greek ship-owners are specially engaged. They are, in fact, the great commission-agents and carriers of the Mediterranean. Greek merchants have now established themselves in London, Liverpool, Manchester, Glasgow, and other towns of the British empire, as well as in those of France and of Germany; and as they have greater facilities for collecting articles of commerce from the inland parts of their own and contiguous countries, besides, as they despise no sort of commission or merchandise, however small or insignificant, they now usurp almost the entire traffic of the Ottoman empire, of Persia, and of other eastern countries.

Internal Commerce.—But one great drawback to the development of Grecian resources, and the increase of a home-commerce, is the miserable state of the internal communication. Without a navigable river, with not a single canal, and with less than 100 m. of road fit for a donkey-cart in the whole extent of its territory, it is little wonder that the inland inhabitants are devoid of energy and enterprise, and that they consume but little of the imports from abroad. Mules, asses, horses, and men carry on their backs over rugged paths, and through mountain-passes, the scanty supplies of foreign luxuries and necessaries for the Greek peasant of the interior. Even from Athens to Corinth there is no carriage-road!

Political Divisions.—In ancient times Greece was divided into a great number of petty states, each consisting of at least a city and some portion of surrounding territory. There was no king ruling over the whole country, no federal union which embraced all the states, no common council or government. Amphictyonic leagues did exist at one period, and in later times the Achæan and Ætolian leagues were formed with patriotic and national objects in view, but these applied only to a limited area, and were of only local operation; hence quarrels were of constant occurrence, and Greece wasted on internal struggles those energies and means, which, if properly husbanded, united, and directed, might have raised her to the very pinnacle of fame and of prosperity in every department of human industry and human exertion. It was only when some monster danger threatened universal destruction that all united for the common good, as in the Persian invasions, and even then jealousies and selfish interests caused many to join with those who sought to ruin the fatherland. The divisions of ancient Greece, as laid down on maps, afford a very imperfect idea of the political condition of the country, singly or relatively; but as they have been so long known to the world under certain names, it will be best to mention them as usually given. Starting at the s.e., we have the triangularly shaped Attica, separated from Bœotia on the n. by the range of Cithæron and Parnes, Bœotia, Phocis, Doris, Locris, Ætolia, Acarnania, Epirus, Thessaly, and Eubœa; and in the Peloponnese, Argolis, Laconia, Messenia, Elis, Achaia, and Arcadia, with Megaris, partly on the isthmus of Corinth. By the existing arrangements, modern Greece is divided into 13 provinces or nomarchies, which are again subdivided into 59 eparchies, and these again into demarchies or cantons. Of the nomarchies there are in Hellas, or northern Greece, Attica and Bœotia, Phocis and Phthiotis, Acarnania and Ætolia: in the Peloponnesus, Argolis and Corinthia, Achaia and Elis, Arcadia, Messenia, Laconia: in the islands, Eubœa, the Cyclades, Corfu, Zante, Cephalonia. See ATTICA, BŒOTIA, EUBŒA, etc.; and for Cyclades, see section "Islands" at the end of this article.

Government.—In ancient Greece each state managed its own affairs, and governments were of different kinds. In Homeric times, monarchy seems to have prevailed to a considerable extent, but in later years republics, aristocracies, and oligarchies almost entirely usurped the ruling power; factions were rife, and in many cases their contests led to a total disruption of the body-politic. The present constitution of Greece was arranged by an assembly elected in Dec., 1863, and adopted Oct. 29, 1864. The whole legislative power is vested in the Boulé, or house of representatives, the members of which are elected by manhood suffrage for four years. The elections take place by ballot, and the chamber must meet annually for not less than three, nor more than six months. There must be an attendance of at least one-half of the members to give legality to the proceedings, and no bill can become law without the consent of an absolute majority of members. The assembly has no power to alter the constitution itself. The chamber of deputies meets, on ordinary occasions, on Nov. 1 (O.S.) of every year. The number of members varies with the population, but in 1875 it was 188. The executive is vested in the king and the ministers at the head of the following departments, who are responsible for the acts of his majesty: ministry of the interior, finance, justice, education and ecclesiastical affairs, war, marine, and foreign affairs. There is also a deliberative council of state, whose members are named by the crown, and hold office for two years. There must not be less than 15, nor more than 25. To this council must be sent all bills from the chamber of deputies, and returned with observations or amendments within 10 days; but this term may be prolonged for 15 days more. If no report is then made,

the deputies may pass the law and send it up to the king. The education of the people is undertaken at the public cost; offices of state and positions of distinction are open to all. (See articles on individual cites and states.)

Administration of Justice.—The supreme court of justice is called, as in Athens of old, the Areopagus. Besides this, there are 4 courts of appeal, 16 courts of primary jurisdiction, the court of assizes, and 175 justice-of-peace courts, with all the orthodox accompaniments of lawyers, juries, notaries, etc. There is a complete code of laws to meet all the cases which may arise between man and man. Capital punishment is exigible for certain offenses, the guillotine being the instrument of execution. The most numerous class of felons are brigands and assassins. The Greek judges enjoy a well-earned reputation for independence and strict uprightness.

Army and Navy.—Under a law promulgated in 1876, the military forces of Greece are divided into four parts—the regular army, the regular reserve, the militia, and the militia reserve. All Greeks between 19 and 30 years of age, not serving in the regular army, are placed in the regular reserve; those from 31 to 40, in the militia; and those from 41 to 50, in the militia reserve. The whole strength of the army under the bill is estimated at 200,000, 120,000 of whom belong to the regular army and its reserve, 50,000 to the militia, and 30,000 to the militia reserve. The number of the regular army is usually about 15,000. At the commencement of 1875 the navy consisted of 1 ironclad, 6 screw steamers, 4 schooners, 2 cutters, and the royal yacht. It is useless as a defense from foreign powers, and serves only to repress piracy, and that in an ineffective way. The naval station is Poros, at the entrance of the gulf of Ægina.

Money, Weights, and Measures.—The unit of the monetary system is the drachma (q.v.) = 8½*d.* English; the unit of weight is the oke = about 2 lbs. 11 oz. avoirdupois; the common measure of length is the pique = 27 inches. A stremma of land is about ¼d of an English acre.

Finance.—The financial affairs of Greece seem to be in a state of hopeless bankruptcy. The kingdom started on borrowed capital, the three great powers of England, France, and Russia having guaranteed a loan of 60 millions of francs (£240,000), partly to indemnify Turkey and other creditors of Greece, and partly to assist agriculture and manufactures in their early struggles. The expenses of the court and government, the carelessness of officials, and the non-receipt of the taxes, have added to the embarrassment of the exchequer, so that at the present time the Greek treasury owes upwards of 483,000,000 dr. (£17,497,000) nearly a third of which is due to the three powers, and the remainder to capitalists, principally in England.

Inhabitants (Ancient Greece).—Of the earliest inhabitants of ancient Greece we have no definite knowledge. The term *autochthones* (sprung from the soil itself—earth-born), which the Greeks applied to themselves, means no more than this, that the people had been there from time immemorial, and that future generations had not the means or the inclination to trace their origin any further back. At a very early period the population of Greece was largely, if not entirely, composed of Pelasgians (q.v.). It is most probable that the Hellenes were only a branch of this great Pelasgian stock, but possessing more energy of character, they gradually spread themselves over the greater part of Greece, and supplanted the language and institutions of the Pelasgi by their own. Thus they became the ruling race, and gave their name to the country.—*Modern Greece.*—The population of modern Greece is of a very mixed kind. In Ætolia, Acarnania, Thessaly, the greater part of Peloponnesus, and most of the islands, the descendants of the old Greeks are still predominant; but a very large admixture of Albanians (see ALBANIA) prevails in Attica, Bœotia, Phocis, and Argolis, with the islands of Spezzia, Salamis, Hydra, and Andro. The true Greek is easily recognized by his tall stature, slim body, aquiline nose, oval face, and mustache. Whiskers are not considered staid and respectable; the beard is worn only in mourning. The Greeks are uncommonly temperate both in eating and drinking, and in the indulgence of the passions generally; flesh is seldom eaten; the diet is principally vegetable. The Greeks are devotedly attached to their fatherland, and their love of liberty and independence is not less strong than it was in the days of Miltiades and Themistocles. Aristocracy is, in consequence, at a discount; and though they love and are loyal to a good ruler, yet they are easily roused into resistance by the infringment of their rights. Commercial bargains are the delight of the Greeks, and they often manage, it is said, to part with their wares at twice their value. This deceit they practice against the Turks especially. The Greek women are very plain. Early marriages are common in Greece. Greek matrons take great pride, like Niobe of old, in a numerous and beautiful offspring. But many of the children are cut off in infancy by the fevers which prevail so commonly. Two peculiar branches of the Greek race are—the Mainotes (from a district called *Maina*) of the Peloponnesus, and the Palikars of the north highlands. The former, who boast to be the descendants of the ancient Spartans, inhabit principally the mountain fastnesses of Taygetus, where for centuries they defied the power of the Turks. They resemble in their sturdy independence, feudal relations, robbing propensities, and other characteristics, the Highlanders of Scotland 150 years ago; but in recent times, education, intermixture with other races, and commerce, have to a great extent removed their distinctive peculiarities. The Palikars, that is, *Braves*, originally belonged to the northern parts of Greece, but when Thessaly and other portions were by treaty left in the hands of the

Turks, these hardy mountaineers chose to leave their ancient homes and settle in the new kingdom, to establish which they had shed their blood. The red cap, the white shirt, and the golden jacket, mark them out even to the casual observer as a separate class. They go about armed, and attended by armed followers; their houses are fortresses, and their servants form a little army. The islanders are almost all seamen or traders; they wear the red cap, a short jacket, and wide Turkish trousers. The Albanians form about a fourth of the population; they are a strong, hardy race, and engage in agricultural or other severe labor. They are the hewers of wood and drawers of water to the more wealthy classes. They speak a language which is little allied to either Slavonic or Greek. The Wallachs are a nomad and pastoral race; they sleep on the hillsides with their flocks, which are guarded by ferocious dogs. There are large numbers of Maltese at Athens, and the Piræus especially. There are few settlers from western Europe. The Bavarians who swarmed into Greece on the accession of king Otho have almost all disappeared.

Religion.—See the articles GREEK RELIGION (ancient), and GREEK CHURCH.

Education (ancient).—The education of the ancient Greeks was more of a physical than of a mental kind. The *gymnasium* was that of the athlete, not that of the *didaskalos* or preceptor. Young children were, till about their sixth year, trained at home under females, but were then sent to the *didaskaleia*, or schools under the charge of private tutors or pædagogi. The duty of the pædagogus was rather to keep his wards from outward injury and bad companions, than to teach them the accomplishments of grammar (including reading, writing, and arithmetic), music, and gymastics, the favorite subjects of study in those days. In later times, the more intelligent slaves were specially trained for the duties of the pædagogus.—*Modern.*—Education of all kinds, from the humblest school to the university, is free to all. Hence, an unusual number of Greeks press into the learned professions, and a large educational machinery is necessary to supply the demand for knowledge. There are about 370 communal or elementary schools, and 180 Hellenic schools, in which, among other branches, ancient Greek is taught. Besides these, there are eight gymnasia, four medical schools, one theological, one military, one agricultural school, one school of arts; and finally, there is the university of Athens, which possesses the four faculties of theology, philosophy, law, and medicine. All these institutions are well attended, and the youth of all ages are most zealous in prosecuting their studies.

Language (ancient).—The Greek language is a branch of that widespread family of tongues, usually called Indo-Germanic or Aryan. It prevailed not only in the different parts of Greece, but also in the numerous Greek colonies which fringed the shores of the Euxine and the Mediterranean. But it must not be supposed that it was of the same type at all periods of Greek history, or in all parts of Greece, even at the same time. The three great branches of the Greek tongue were: 1. The Æolic, the oldest form, and that which presents the greatest affinity to the Latin and other members of the Indo-Germanic stock. 2. The Doric, a highland dialect, delighting in broad and rough sounds; it was spoken in the mountains of Thessaly, whence it traveled southward, and on the migration of the Dorians, took possession of the Peloponnesus. 3. The Ionic, a soft and vocal language, delighting in vowel sounds, and avoiding the harsh combination of consonants; it was spoken principally by the people of Attica and the Ionian colonies in Asia Minor. From it was made, by a series of contractions and modifications, that most perfect form of the Greek language, the *Attic*, which was neither so harsh and broad as the Doric, nor so soft and vocal as the Ionic. It was brought to the height of perfection by the poets, the philosophers, and the historians of Greece, whose writings still teach the world, and command its admiration. By the conquests of Alexander the Great, the Greek language soon spread over a large part of the then known world, but corruption at once set in—words of other languages were adopted into the Greek, foreign idioms were introduced, and the rigid syntax of the great Athenian writers was neglected, so that, in process of time, there arose a depraved form of speech, called the Hellenistic, varying in many essential points from its great parent. In this last form, the books of the New Testament were written. The process of deterioration still went on till about the middle of the last century; when at length the spirit of the Greek nation again arose, and amidst other endeavors to revive the ancient glory of their race, an attempt was made, and is still being made, and that too with great success, to restore the purity of the language. This leads us to the *Language of Modern Greece.*—In different parts of Greece, different languages are spoken according to the element which predominates in the population. Thus Turkish prevails in some districts, Albanian in others, Wallachian in others, and Bulgarian in others; but in the greater part of Greece proper, the language is *Romaic Greek*, or as it is now more usually and more properly called, Neo-Hellenic. This language bears a very close resemblance to the Hellenic, or classical Greek; and in fact does not differ more, if so much, from the Attic, as the Attic differed from the Doric. Information on this subject must be sought in a grammar of the language. Great efforts have been made in recent years to purge the Neo-Hellenic of barbarisms and foreign terms, and it is now written with such purity, that good scholars in ancient Greek will have little difficulty in understanding Tricoupi's history or an Athenian newspaper.

Literature (ancient).—The literature of Greece is a subject so extensive, that we can-

not hope to give any adequate view of it in our limited space. Those who wish to study the matter further, must have recourse to a full treatise. Poetry seems to have been the earliest form of composition among the Greeks, as indeed it must of necessity be in all nations, for facility of recollection; hence *Memory* is called the *Mother of the Muses*. The earliest species of poems seems to have been hymns in honor of the gods; to these succeeded songs praising the glorious deeds of heroes; but the greatest poem of ancient times which has come down to us is the *Iliad* of Homer, detailing the events connected with the siege of Troy, and the warriors who took part in that famous expedition. The *Iliad* and *Odyssey* have been too long and too generally known and admired to need a word said in their commendation. The remarkable popularity of the Homeric poems produced a host of imitators; and hence we find that a great many poets endeavored to rival the fame of the "blind old man," by narrating in verse the after-fate and vicissitudes of the heroes who took part in the war of Troy, or by treating of subjects allied to that of the *Iliad*, and even of mythological fables. These were called the Cyclic poets; they were posterior to Homer and Hesiod; their writings were put together in chronological order by some Alexandrine grammarians about 200 B.C. The Homeric period is closed by the name of Hesiod. Homer is supposed to have flourished about 900 B.C., and Hesiod about 850 B.C. Hesiod's most celebrated writings are the *Theogony*, the *Shield of Hercules*, and the *Works and Days*, an agricultural poem. Of his others, only small fragments are preserved. Epic poetry culminated in Homer, and with him and his contemporaries it sets. Of lyric poetry, there were two schools—the Æolic in Asia Minor and adjacent islands, especially Lesbos, and the Doric in Peloponnesus and Sicily. Of the Æolic school, the earliest poet was Callinus (700 B.C.); after him came Archilochus, so famed for his cutting satires, written in iambic verse; Tyrtæus, and Simonides of Amorgos, who contests with Archilochus the honor of having invented iambic verse. Alcæus and Sappho (about 610 B.C.) represent the Æolic school in its perfection. Nor must we forget the school-boy's favorite, Anacreon (about 520 B.C.), to whom, however, are attributed many pieces which are not considered genuine. Of the Doric or choral school, it may suffice to mention Alcman, Stesichorus, Arion, Simonides, Bacchylides, and greatest of all in every known variety of choral poetry, Pindar (q.v.) the Theban (522 B.C.).

Greek literature reached its highest perfection in the tragedies of Æschylus (b. 525, d. 456 B.C.); Sophocles (b. 495, d. 405 B.C.); and Euripides (b. 480, d. 406 B.C.). The writers who endeavored to follow in the track of these three great masters were of far inferior merit, and with them tragedy degenerated to the effeminacy of lyrical songs and mere rhetorical bombast.

Comedy, like tragedy, took its origin from the worship of Bacchus. The three great names of the old Attic comedy are Cratinus, Eupolis, and Aristophanes (b. 452, d. 380 B.C.). In middle comedy, we have the names of Antiphanes and Alexis; and in new comedy Philemon and Menander.

History did not engage the attention of the Greeks till a comparatively late period. Passing over the names of Cadmus of Miletus, Pherecydes of Scyros, Hecatæus, and Charon of Lampsacus, we come to Herodotus, the father of history, or, as he has been called, the Homer of history, who flourished about 440; Thucydides, about 430; and Xenophon, about 400. In later times, we find Polybius (204–122 B.C.); Dionysius, of Halicarnassus, who flourished about 20 B.C.; Diodorus Siculus, a contemporary of Julius and Augustus Cæsar; Plutarch; Appian (in time of Hadrian and Antoninus Pius); Arrian (time of Hadrian); and Dion Cassius. In geography, we have Strabo and Pausanius. In satire, the palm is carried off by Lucian (q.v.). In oratory it may be sufficient to mention the names of Antiphon, (b. 480 B.C.), Andocides (467 B.C.), Lysias (458 B.C.), Isocrates (436 B.C), Æschines, the great rival of Demosthenes (389 B.C.), Hyperides; and last and greatest of all, Demosthenes (385 B.C.). On the philosophers, see PHILOSOPHY.

Literature (modern).—The literature of modern Greece is still in its infancy. No work of importance appeared previous to the revolution; but since the establishment of the kingdom in 1829, more life has been infused into the men of a literary bent. The names of the brothers Panagiotis and Alexander Soutsos are well known to many in England. They have written dramas, love-songs, novels, lyrics, and a poem (by Alexander) in the style of Byron's *Childe Harold*, detailing the wanderings, sights, and adventures of a Greek in France and Italy. In most of these there is much merit, though few readers can fully appreciate the style and handling. Among dramatic writers, Neroulos, Rangavis, and Charmouzis hold a foremost place. The *Memoirs of Different Battles fought between the Greeks and Turks from* 1820 *to* 1829, by Perrævos, is a well-written book. In grammar and lexicography, Banvas, Gennadios, Scarlatto Byzantino, and others have done good service to the cause of learning. But of all the Neo-Hellenic works yet published, the *History of the Greek Revolution* by Tricoupis is the most valuable—valuable not only for its statement and facts, but also for the purity and elegance of its style. Many newspapers and other periodicals, in Neo-Hellenic, are published at Athens, Constantinople, London, and elsewhere; but the expense of these literary efforts is in most cases borne by wealthy Greek merchants now so frequently met with in the west of Europe. It will require many years of good government, of national industry

and prosperity, before Greece can expect to assume that position in the world of letters which the prestige of her name entitles her to anticipate.

History (*ancient*).—The early history of Greece is lost in the mist of ages. The legends of gods and heroes, which constitute her only approach to history, are of that marvelous kind in which a superstitious and ignorant age delights. But how much truth may underlie the stories of Cecrops, Cadmus, Danaus, Theseus, Heracles, and many others, it is difficult to say; or to what extent the events of the Argonautic expedition, Trojan war, hunt of the Calydonian boar, and other joint-stock exploits may be real, historians can never hope to discover. The heroic age is roughly estimated as continuing from 1400 to 1200 B.C.; but all Greek chronology is mere guess until the first Olympiad, 776 B.C. Of the migrations which took place during these early days, and of the numerous colonies planted by the Greeks, it is unnecessay to speak in this brief sketch; nor can we do more than merely refer to the wars of the Spartans against the Messenians, which, beginning in 743 B.C., did not ultimately terminate until Ithome was destroyed in the third Messenian war, 455 B.C. Meantime, wars of less magnitude are carried on in different parts of Greece; Solon legislates at Athens (594 B.C.); Pisistratus and his sons enjoy the "tyrannis" at Athens from 560 B.C. to 510 B.C.; Crœsus, king of Lydia, and Cyrus the great, his conqueror, are brought into contact with the Asiatic Greeks (560–542 B.C.). And now, in 499 B.C., the burning of Sardis by the Athenians and Ionians leads to those three invasions of Greece by the Persians which end so gloriously for Greece, and so disastrously for Persia, and with the particulars of which all are so well acquainted. The first, under Mardonius, in 492 B.C., is averted by the shipwreck of the invading fleet off Mount Athos; the second, under Datis and Artaphernes, in 490 B.C., is hurled back from Marathon; and the third, under Xerxes, 480 B.C., is utterly shattered at Thermopylæ, Salamis, and Platæa. Greece is now a mighty name, but the Athenians become the ruling state, and their supremacy continues till 404 B.C. Meantime, disunion at home succeeds the contests with foreign enemies. The great Peloponnesian war begins in 431 B.C., and wastes the energies of Greece for 27 years, until the subjugation and partial demolition of Athens, in 404 B.C., put an end for a time to the fratricidal struggle. It was in 415 B.C., the 17th of this war, that the famous and unfortunate expedition to Sicily took place. Under Pericles, who was the ruling spirit of Athens at the commencement of the war, but who died of the great plague in 429 B.C., the Athenians reached the highest pitch of excellence in sculpture and architecture; then were raised some of those wondrous buildings whose remains still excite the admiration of posterity at a distance of more than 2,000 years. In 401 B.C. the expedition of Cyrus the younger to dethrone his brother Artaxerxes, took place; the battle of Cunaxa, in which Cyrus was slain, was fought in the same year. Cyrus had employed Greek mercenaries, and this brief war is specially famed for the masterly retreat of the 10,000 Greeks under Xenophon the Athenian in 401–400 B.C. The next year (399 B.C.), Socrates the philosopher, the teacher of Plato and Xenophon, was put to death. After the defeat of the Athenians in the Peloponnesian war, the Spartan state became the leading power in Greece, and was engaged in four wars in sucession—1. the Elean (399–398 B.C.); 2. the Corinthian (395–387 B.C.); 3. the Olynthian (380–379 B.C.); 4. the Theban (378–362 B.C.). The great Spartan hero of these troublous times was Agesilaus, whose panegyric has been written by Xenophon with a friendly pen. During these eventful years were fought the battles of Coronea and of Corinth (394 B.C.), Orchomenus (375 B.C.), Leuctra (371 B.C.), Mantinea, in which the Theban hero, Epaminondas, was slain, 362 B.C. In 359 B.C. Philip ascends the throne of Macedonia, and a few years afterwards finds occasion to intermeddle in the affairs of Greece. Some of the allies of Athens renounce his supremacy, and thus arises the social war (357–355 B.C.), in which Athens loses many of her tributaries, and much of her revenue. The sacred war (355–346 B.C.) immediately follows, in which Philip takes part. About this time (352 B.C.), Demosthenes delivered the first of those powerful orations against Philip, called Philippics. In the battle of Chæronei a (338 B.C.), the Athenians and Thebans are utterly defeated by Philip; and at the congress of Corinth, in the following year, he is appointed generalissimo of the Greek forces against Persia. But the hand of the assassin cut him off at a marriage-feast in Macedonia; and after an unsuccessful revolt against his son Alexander, the Greeks are compelled to bestow upon the youthful hero the same high military office with which they had intrusted his father. The events of Alexander's career are well known. From this time Greece becomes an appanage of the Macedonian kingdom, until Macedon is in turn overcome by the Romans. During the wars which arose among the successors of Alexander, Greece was always the bone of contention; she suffered in consequence many hardships and enjoyed but few lulls of peace. The last struggle for Grecian liberty was made by the Achæan League (a confederacy of cities at one time embracing all Peloponnesus, which had a common object, a common council, and a common chief or *strategus*), but it too fell before the conquering arms of Rome, and after the capture of Corinth in 146 B.C. by the consul Mummius, the once mighty Greece became a province of the Roman empire.

History (*modern*).—The history of Greece for some centuries after the capture of Corinth belongs to the history of her conqueror. The Roman wars with Antiochus,

Mithridates, and others, involved Greece in countless hardships; and the fierce struggles of Cæsar and Pompey, of Brutus and Cassius with Antony and Octavianus, of Antony and Octavianus, of which Greece was often the theater, entailed upon her many calamities. For nearly two centuries after the accession of Augustus, Greece enjoyed comparative tranquillity, during which Christianity spread among her people, churches were founded, and many devoted Greeks went abroad to strange lands and periled their lives in the propagation of the gospel. But dark days again awaited her, and successive inroads of Slavonians, Albanians, and other barbarous hordes, overran the country from the wintry plains of the north. When Constantine divided his empire, Greece was attached to the eastern portion; but when, in 1204 A.D., the Venetian fleet under Dandolo overpowered the rickety throne of the Cæsars, Greece too changed masters. The Osman Turks, who migrated to Europe in 1355 A.D., and made themselves masters of Thrace, Macedonia, Thessaly, and other parts, captured Constantinople in 1453 A.D.; and from that time until recent years, Greece was subject to Mohammedan dominion. All the annoyances that ignorance, brutality, tyranny, and greed could suggest, were practiced by the Turks on the much enduring Greeks, but at length human nature could no longer endure, and in 1820 broke out that rebellion against Turkish rule, which, by the bravery and determination of the Greeks, and the friendly countenance of Christian Europe, ended in the establishment of Greece as an independent kingdom in 1829. Two unsuccessful attempts at rebellion had been made in 1770 and 1790. Capo d'Istrias, the first president of liberated Greece, was assassinated in 1831; and after several candidates for the throne of the infant kingdom had been proposed and rejected, Otho, second son of the king of Bavaria, was at length (1832) chosen by the three powers (Britain, France, Russia) which had assisted Greece in her noble struggle. The reign of Otho was not a peaceful one, and he had very serious difficulties to contend with after he had assumed the reins of government in 1835. But his rule has not been altogether devoid of fruit; and law and order, industry and commerce, literature and notions of self-government, have advanced. On the banishment of Otho in 1862, the crown was offered to prince Alfred of England. The agreement between the protecting powers, however, stood in the way of his election, and the present king, Georgias I., son of Christian IX. of Denmark, became king of the Hellenes in 1863. The Berlin congress of 1878 recommended the addition to Greece of the southern portions of Thessaly and Albania; but difficulties occurred to postpone this desirable restoration.

Population.—The population of ancient Greece at any one time it is quite impossible to conjecture. Of modern Greece, the inhabitants numbered, in 1871, 1,457,894.

The Islands.—The islands of the Ægean sea may be comprehended, as in ancient times, under two groups—the Cyclades and the Sporades. The former were so called from the legend of their *circling* round Delos, when that island was rendered stationary for the birth of Diana and Apollo. The latter receive their name from the circumstance of their being *scattered* or *sown* in an irregular manner round the coasts of the adjoining countries, and mostly belong to Turkey. The following list contains the islands belonging to Greece; the first 20 are the Cyclades; the others, part of the northern Sporades, lie off Eubœa. The Italian names are in parentheses. The Ionian islands, formerly a republican dependency of Great Britain, were annexed to Greece in 1864.

1. Delos with Rhenea (Dili); 2. Syros (Syra); 3. Myconos (Mycono); 4. Tenos (Tino); 5. Naxos (Naxia); 6. Andros (Andro); 7. Ceos (Zea); 8. Cythnos (Thermia); 9. Seriphos (Serpho); 10. Siphnos (Siphanto); 11. Cimolos (Argentiera); 12. Melos (Milo); 13. Pholegandros (Policandro); 14. Sicinos (Sicino); 15. Ios (Nio); 16. Thera (Santorin); 17. Anaphe (Nanfio); 18. Amorgos (Amorgo); 19. Paros (Paro); 20. Oliaros or Antiparos (Antiparo); 21. Scyros (Scyro); 22. Sciathos (Sciatho); 23. Scopelos (Scopelo); 24. Icos (Chiliodromia). Besides these, there are many smaller islands and barren rocks, which belong to Greece, but which from their unimportance scarce deserve mention. These islands possess many of the features which mark the mainland: the climate is varied; the soil is in one fruitful, in another barren; the productions are much the same as in Greece, except that in some of them, as Santorin, the vine grows in greater variety and luxuriance; the population is more primitive, and less mixed, and consequently retain more pertinaciously the customs of their forefathers. The islanders are generally more industrious and more happy than the continentals—the sea is their highway, and they can more easily get a market for the fruits of their industry. The islanders are excellent seamen, and a very large proportion of the males are employed in navigation. Delos is now little more than a barren rock; and scarce a vestige remains of the temple of the Sun-god, or other memorial of its former religious and commercial pre-eminence.

Syra (population 21,000) is the principal port of Greece, and a great center of trade. The Mediterranean steamers call at it. Wine is almost the only production of the island.

The people of Tenos are famed for the manufacture of marble tables, chimney-pieces, etc., which are largely exported, and the finest Malvasian or Malmsey wine is produced in the island. Of the other islands, the most volcanic is Thera; it produces in large quantity the wine called *Vino Santo*, or Santorin, of which the Russians are specially fond. Naxos is the largest and most beautiful and most fertile of the Cyclades. These islands comprise an area of rather more than 1000 sq.m., and a population in '71

of 123,299 souls. The Cyclades are generally high and rocky in their coasts, and all are of a very similar aspect in this and other regards.

GREEK CHURCH, THE, taken in its widest sense, comprehends all those Christians following the Greek or Greco-Slavonic rite, who receive the first seven general councils, but reject the authority of the Roman pontiff, and the later councils of the western church. The Greek church calls itself "the Holy Orthodox Catholic and Apostolic church," and it includes three distinct branches—the church within the Ottoman empire, subject directly to the patriarch of Constantinople; the church in the kingdom of Greece; and the Russo-Greek church in the dominions of the czar. The last shall form the subject of a separate article, but it must also be alluded to in treating of the sister-churches. The proper history of the Greek church as a separate body dates from the commencement of the Greek schism, or rather from the commencement of the efforts on the part of the church of Constantinople to establish for itself a distinct jurisdiction, and an independent headship in the eastern division of the empire. The ecclesiastical pre-eminence of Constantinople, it need hardly be said, followed upon the political distinction to which it rose as the seat of the imperial residence, and the center of the imperial government. Originally, Byzantium was but a simple episcopal see, subject to the metropolitan of Heraclea; but the rank of the see rose with the fortunes of the city; and before the close of the 4th c., a canon of the first council of Constantinople, held in 381, assures to it, on the ground that "Constantinople is the new Rome," the "precedence of honor" next after the ancient Rome. This privilege, however, was purely honorary, and did not imply any pre-eminence of jurisdiction in the see of Constantinople, and there are many early instances in which questions arising within the district which afterwards became the patriarchate of Constantinople, nay, questions affecting the bishop himself, and even in his relations to the other patriarchs, were referred to the bishops of Rome. But the transition was not difficult, and was aided by the eminent qualities of some of the bishops, and especially of St. John Chrysostom, so that in the council of Chalcedon (451), a decree was passed, which confirmed the precedence already given, and not only assigned to Constantinople an extensive range of jurisdiction, but also grounded these ecclesiastical privileges, in the case of the new as well as in that of the old Rome, upon the political precedence to which both successively had risen. The Roman legates protested against this canon, and the claim led to a misunderstanding between the two churches, which was widened and confirmed by the doctrinal differences which prevailed on the Eutychian question, in which the patriarchs of Constantinople gave their support to the *Henoticon*, a heterodox or equivocal formula put forth by the emperor Zeno, which was warmly resisted in the west. The pope, in consequence, in 484, excommunicated the emperor, together with the patriarchs of Constantinople and Alexandria; and thus the east and west were, *de facto*, separated for a period of nearly 40 years. The terms upon which the excommunication was withdrawn by pope Hormisdas in 519, involved a complete and explicit acknowledgment of the supremacy of the Roman pontiff; but the rivalry of Constantinople still subsisted. In the end of the 6th c., the Trullan council (see TRULLAN COUNCIL) caused a renewal of the misunderstandings. Many circumstances combined to hasten a rupture: the title of "Ecumenical patriarch" claimed by the patriarch John the faster, and reprobated by Gregory the great (see GREGORY I.); the contests about image-worship, in which the patriarchs, in more than once instance, took the part of the iconoclast emperors; the abandonment by the emperors of the defense of Italy against the Lombards; the gradual growth of an independent confederation of Italian states, and ultimately the foundation of a new empire of the west, the political antagonism of which with the eastern empire almost necessarily involved an antagonism of the churches themselves. Hence when, upon occasion of his own personal contest with the see of Rome, the deposed patriarch Photius (862) (see PHOTIUS), identified his cause with that of the eastern church, he found a ready sympathy among his countrymen. The Latin doctrine of the twofold procession of the Holy Ghost, and the addition of "Filioque" to the Latin creed, the Latin practice of clerical celibacy, and of denying to priests the power of administering confirmation, supplied the grounds of quarrel; and although the Photian schism fell with its author, and the communion of the churches was restored, their reconciliation was imperfect and far from cordial. The same causes of controversy, with others of a disciplinary nature, were renewed in the 11th c.; and in 1054 the pope Leo IX. issued a formal sentence of excommunication against the patriarch Michael Cerularius, which was solemnly published in Constantinople by the papal legates. Beyond the points of difference alleged by Photius, the most important of the new grounds of division was the use of unleavened bread by the Latins in the eucharist. Since that time, the separation has been perseveringly maintained. More than one attempt was made by the authorities upon either side to restore the former relations of the two churches, but in vain. The old antipathies of east and west became more inveterate by the separation; and the occupation of Constantinople by the Latins (1201), the outrages and atrocities by which it was disgraced, the establishment of the Latin kingdom at Constantinople, and the arbitrary tyranny by which it was maintained, widened still more the ancient estrangement. Nor was the breach healed by the re-establishment of the Greek empire (1261). The emperors, from political motives, pressed on all sides by the fears of foreign invasion and the embarrassments

of domestic discontent, proposed, as the price of the assistance of the west in their necessity, the restoration of the eastern church to the obedience of Rome. Michael Paleologus (see MICHAEL PALEOLOGUS) by his ambassadors abjured the schism at the council of Lyons in 1274; and endeavored, by a synod held subsequently at Constantinople, to obtain a ratification of the union; but he failed to gain the assent of the body of bishops; and in the succeeding pontificate, the breach was even more seriously renewed, by two synods held at Constantinople in 1283 and 1285. The necessities of John Paleologus compelled him once again to resort to the same expedient; and the negotiations for union were on this occasion conducted with much more deliberation. Delegates of the Greek church, with the patriarch of Constantinople at their head, attended at the great western council (1437) of Ferrara (better known, from the place of its close, as that of Florence), and a protracted discussion took place, the chief points of which were the procession of the Holy Ghost from the Father and Son, the addition of "Filioque" to the creed, the nature of the purgation of souls after death, the use of unleavened bread in the eucharist, and the supremacy, by divine right, of the Roman pontiff. On all these points, the Greek delegates, with the exception of Mark, bishop of Ephesus, subscribed the decree of the council; but this union was equally short-lived. On the return of the delegates to Constantinople, their proceedings were repudiated by the large body of the Greeks; and the downfall of the Greek empire and capture of Constantinople by the Turks in 1453, obliterated every trace of the attempted reconciliation. Since that time, some isolated bodies of Christians of the Greek rite have joined the church of Rome (see end of this article); but every attempt at a general union on the part of the Roman pontiffs has proved a failure. It has been the same with the attempts which have been made by the Protestant communions to establish an understanding with the Greek church. Very early after the reformation, a letter was addressed by Melancthon to the patriarch Joseph of Constantinople through a deacon, Demetrius Mysus, who visited Germany in the year 1558. Another Lutheran embassy of a more formal character, headed by the well-known Tübingen divines, Andreæ and Crusius, visited Constantinople during the patriarchate of Jeremias (1576–81). But both missions were equally without result. In the following century, the celebrated Cyril Lucaris (see LUCARIS), who had been educated in the west, and had carried home with him a strong, though for a time carefully concealed bias towards Protestantism, opened the way for negotiations with the Calvanistic party. Soon after his elevation to the patriarchate, he issued a decidedly Calvanistical confession of faith (1629). But far from carrying his fellow-churchmen with him in the movement, the innovations which he attempted not only led to his own deposition and disgrace, but called forth a doctrinal declaration signed by the patriarchs of Constantinople, Alexandria, and Antioch, and many metropolitans and bishops, which, by the clearness and decision of its definitions, draws the line so markedly between the Greeks and reformers as to shut out all possibility of accommodation in matters of doctrine. This exposition was adopted by all the churches; and in a synod held in Jerusalem 1672, it was adopted as the creed of the Greek church. This declaration having been originally drawn up by Magilas, metropolitan of Kiew, it was published in 1722, by order of Peter the great, as an authorized formulary of the Russian church, under the title of *The Russian Catechism*. With a few exceptions, to be specified hereafter, it coincides with the formularies of the Roman Catholic church.

The Greek church comprised within its ancient limits, anterior to the Moliammedan conquest, Greece properly so called, the Peloponnesus, Eastern Illyricum, the islands, and Asia Minor, as also Syria and Palestine, Arabia, Egypt, and parts of Mesopotamia and Persia. But with the first triumph of the Koran, the church of Constantinople by degrees lost almost all her territory in Asia and Africa; and since the conquest of the Turks, it has sunk into the condition of a weak and oppressed dependent. By the separation of the Russian branch, partially in the 17th, and finally in the beginning of the 18th c., and by that of the new kingdom of Greece, on occasion of the revolution, its importance has been still more diminished. Each of the three divisions into which it has separated possesses a distinct organization; but as the faith and practice of all are substantially identical, we shall first give a brief account of the doctrines of the Greek church, especially in their relations to the Christian communions of the west, and to the controversies by which they are separated from each other.

In general, it may be inferred from the fact that the Greek church receives the first seven councils, that on all the controversies regarding the trinity and incarnation the Greeks are agreed with the Western Catholics, with the sole exception of the double procession of the Holy Ghost, in which they are at issue not only with Catholics, but it may be said with the entire body of western Trinitarians. While they reject the papal claim to supremacy and doctrinal authority, they agree with Catholics in accepting as the rule of faith not alone the Bible, including the Deuterocanonical books (see Synod of Jerusalem in Harduin's *Coll. Concil.*, xi. col. 258), but also the traditions of the church, that is, what are believed to be the unwritten revelations of our Lord and of the apostles, preserved by the testimony of the fathers, among whom they regard with special veneration Basil, Gregory of Nazianzum, and Chrysostom. They admit the seven sacraments as received by the Roman church—viz., baptism, confirmation, eucharist, penance, extreme unction, holy orders, and matrimony; but in the rites used by them in the administration of these sacraments there are considerable discrepancies from the Latin

rite. They administer baptism by a triple immersion; confirmation is administered in immediate connection with baptism, even in the case of infants, and it is administered by priests, and not, as among the Latins, by bishops exclusively. As to the eucharist, the Greeks admit the real presence of Christ, the transubstantiation of the elements, the propitiatory sacrifice, and (although this has been denied by Protestants) the adoration of the host (see Renaudot, *Liturg. Collectio*, i. pp. 22, 23). But they differ from Catholics in the use of leavened bread, in administering the communion in both kinds, and in administering it in this form even to children. In the sacrament of penance, they recognize, like the western Catholics, auricular confession, priestly absolution, and penitential works; and although they differ from the Latins as to the use of indulgences, they admit the principle upon which their use is founded, and even their applicability to the dead. The peculiarities of their use of extreme unction have been already detailed. See EXTREME UNCTION. In the sacrament of holy orders, they have many peculiar observances. See ORDERS, HOLY. The most striking point of difference regards clerical celibacy. The Greek church recognizes the excellence of virginity, and the fitness of its observance by those engaged in the ministry, so far as to prohibit marriage altogether to bishops (who are always chosen, in consequence, from the monastic, and not the secular clergy); to forbid priests or deacons to contract marriage after ordination; to forbid to all, without exception, a second marriage, or marriage with a widow; and to require of married priests that they shall live separate from their wives during the time when they are actually engaged in church services. But they not only permit married candidates to be advanced to deaconship and priesthood, but even require, as a general rule, that they shall be actually married before they can be admitted to orders. While admitting marriage to be a sacrament, they hold it to be dissoluble in case of adultery, and they regard fourth marriages as utterly unlawful. On the condition of souls after death, they do not admit with western Catholics a purgatorial fire, but they admit the principle of the intermediate state of purgation, and of the practice of prayer for the dead. They also admit the intercession of saints, and the lawfulness of invoking them, especially the Holy Virgin Mary, and of honoring their shrines and relics. They do not permit the use of graven images, with the exception of that of the cross; but they freely receive and pray before pictures, which they hold in high honor, and on which they lavish the most costly ornaments of gold, jewels, and other precious things. In their belief of the merit of good works, and especially of fasting, they go even further than Roman Catholics. Besides four yearly fasts—the forty days of Lent, from Pentecost to the feast of saints Peter and Paul, the fifteen days before Assumption day, and the six weeks before Christmas—they observe the Wednesdays and Fridays throughout the year as fasts. Their liturgy shall be described hereafter (see LITURGY); for the present, it will be enough to say that, in splendor of ceremonial, they are not inferior to the westerns. Instrumental music, it is true, is forbidden in the churches, but singing is universally in use. In public prayer the kneeling posture is used only at pentecost; at ordinary times they stand, the body being turned towards the east. The use of the sign of the cross is habitual among them. The monastic institute has subsisted in the Greek church from the earliest times, and numerous convents of both sexes are dispersed over the east, which follow almost exclusively the rule of St. Basil. The abbot is called Hegumenos, the abbess, Hegumené; if several convents be subject to a single abbot, he is called Archimandrite. Both monks and nuns are bound by vows of celibacy. With both, the duty of manual labor is a leading observance; the nuns, like their western sisters, apply themselves to the care of the sick, and to the education of young females.

As regards the separate constitution of the three great sections of the Greek church, it will be enough to say that the church in the Turkish empire has remained subject to the patriarch of Constantinople, who from the beginning enjoyed a continued but precarious protection from the sultan, and even held as regarded his own flock, a civil pre-eminence, with the rank of a "pasha of three tails." But in return for this civil status, the Porte claimed the right of appointing and also of deposing the patriarch, a right which was habitually exercised as a matter of purchase and sale, and which led to the grossest simony, not only as to the patriarchate, but in the entire ecclesiastical system. Formerly, the metropolitan of Russia (afterwards patriarch) was subject to the patriarch of Constantinople, as also the bishops of the modern kingdom of Greece; but both churches are now independent of Constantinople. The patriarch of Constantinople, Jeremias II., in in the year 1589, consented to the creation of a separate but dependent patriarch: and this dependence continued until the time of Peter the great, by whom the partriarchate was first suspended and afterwards abolished, the Russian church being now governed by what is called the holy synod, an ecclesiastical commission appointed by the czar. The independence of the church of the kingdom of Greece dates from the revolution. The "organic law of Epidaurus," of Jan., 1822, proclaimed the oriental Orthodox church as the church of the state, and soon afterwards measures were taken to organize this church in the new kingdom. For a time, the patriarch of Constantinople hoped to preserve his ancient authority; but the president of the new state, Capo d'Istrias, firmly resisted, and, after many preliminaries, the new church was formally organized by a decree of July 15 (27), 1833, on a plan in great part borrowed from the constitution of the Russian church, as settled by Peter the great.

The governing body in the church of the kingdom of Greece is, as in the Russian, the so-called "Holy Synod," which consists of five members, who are ordinarily archbishops, or bishops, but may also admit into their number one or two priests or monks. This synod is the supreme ecclesiastical tribunal, and in name at least is independent in spirituals; but as its members are all named by the crown, and hold office but for a year, it is practically a state instrument; moreover, two officials of the crown have a right to assist, although without a vote, at all its deliberations. The synod elects bishops, but the crown has the right of confirming and granting investiture. To it also belongs the power of regulating the limits of dioceses, and all such general arrangements. The last remnant of subjection to Constantinople was removed by a formal recognition of independence in 1868, and the bishops no longer seek consecration from the patriarch of that see. In 1869 a correspondence took place between the archbishop of Canterbury and the patriarch, with a view to the union of the Anglican and eastern churches. In the same year the government of Russia abolished the hereditary character of the Russo-Greek priesthood. The Russo-Greek church is believed to number about 55,000,000. The church of Greece comprehends a district of about 880 sq.m., and numbers about 800,000 members.

THE UNITED GREEK CHURCH comprehends those Christians who, while they follow the Greek rite, observe the general discipline of the Greek church, and make use of the Greek liturgy, are yet united with the church of Rome, admitting the double procession of the spirit and the supremacy of the Roman pontiff, and accepting all the doctrinal decisions subsequent to the Greek schism which have force as articles of faith in the Roman church. The united Greeks are found chiefly in southern Italy, in the Austrian dominion, in Poland, and in the Russian empire. In Italy, they are computed at 80,000; in Austria, at about 4,000,000; and in Poland, about 250,000. In Russia, it is difficult to ascertain their number. It has fallen off considerably in late years. In Austria, they are divided into Romanians and Ruthenians—the former being settled in Wallachia, Transylvania, and eastern Hungary; the latter, in Little Russia, Galicia, and north-eastern Hungary. The union of the Greek Christians of Wallachia and Transylvania dates from the end of the 12th c.; and although the reformation made some progress among them, they still for the most part remain true to the union. The union of the Galician Greeks or Ruthenians is of much later date, about the close of the 17th century. It is only necessary to add that the usage of the united Greek church as to the law of celibacy is, with the consent of the Roman pontiffs, the same as among the other Greeks. They are also permitted to administer communion under both kinds.

GREEK-FIRE, a composition supposed to have been of niter, sulphur, and naphtha as a principal ingredient, with which the Greeks of the Byzantine empire were wont to defend themselves aginst their Saracen adversaries. The accounts of its effects are so mingled with obvious fable, that it is difficult to arrive at any just conclusion as to its power; but the mixture appears to have been highly inflammable, and to have possessed the power of burning under water. It was projected either on blazing tow, tied to arrows, or through a tube, the precursor of cannon. Wherever the combustible fell, it made great havoc, from the inextinguishable nature of the fire. The invention of this material has usually been ascribed to Callinicus of Heliopolis, and the year 668 A.D; but there seems to be reason to believe that it was rather imported from India. At Constantinople, the process of making Greek-fire was kept a profound secret for several centuries. The knowledge, however, of its composition gradually spread; and at the time of the discovery of gunpowder, Greek-fire formed a recognized defensive element in most wars from western Europe to Asia Minor. Subsisting for some time concurrently with gunpowder, it gradually died out before the advances of that still more effective competitor, till now little vestige remains of Greek-fire beyond a Norman corruption of its name in our fire-work "cracker," which derived from "Creyke" of the middle ages, is but a corruption of "Grecque." See also FIRE-ARMS.

GREEK MUSIC. The existence of music as an art or science among the ancient Greeks has for hundreds of years been a subject of inquiry and discussion among the learned. With the restoration of the art and sciences at the end of the middle ages, the veneration for all that belonged to that people was carried to such an extent, that because we had to thank them for much, many writers thought we must be obliged to them for all. Fortunately, we have handed down to us various dissertations and fragments on music by old writers, which, although they do not unfold to us anything like a satisfactory view of the ancient Greek music, yet suffice to show us that among the ancient Greeks the art of music was in a very imperfect and incomplete state, and that, in its elements and groundwork, it was entirely a slave to poetry, and can have been little else than a kind of intoned declamation. We hear from ancient writers of the magic influence of music; but we must not forget that they used the word music in a collective sense for the gift of the muses generally; and when they spoke of the elevating and moral effects of music, it is to be understood that they meant a general harmonious cultivation of the arts and sciences. The system of music known to the ancient Greeks, and as practiced in their temples and theaters, differed essentially from our modern music, as their scale, or succession of sounds, was not based on the octave and its repetition, but on a fourth and its repetition. Their scale consisted of five tetrachords,

each containing four consecutive sounds; the last sound of one tetrachord being always the first of the next; while two of their tetrachords had more than one sound in common. In modern music, the ancient Greek scale would be as follows: B, C, D, E; E, F, G, A; A, B♭, C, D, etc. This they called the diatonic genus. They had also their chromatic genus, thus, B, C, D♯, E; E, F, G♯, A, etc.; and their enharmonic genus, the tetrachords of which consisted of two quarter-tones (which cannot be expressed in modern music) and a major third. It is beyond a doubt that the ancient Greeks neither possessed a system of notation by which their music, such as it was, might have been preserved, nor had they any idea of harmony in the modern sense of the word. Many believe it impossible that a people who have left us specimens of their poetry and sculpture, which, after 2,000 years, are still admired as master-works, could have been content with such an imperfect and clumsy system of music. Had it been otherwise, it is scarcely possible to imagine that the knowledge of it would not have been handed down to us. An ode by Pindar, and a hymn or two set in modern notation from an old Greek MS., is the whole we possess of ancient Greek music, and those are said by many to be spurious.

GREEK PHILOSOPHY. See PHILOSOPHY.

GREEK RELIGION (ANCIENT), the most poetical and most humane of polytheisms, presents itself in historical times as a plastic worship of nature, with its visible objects and its invisible powers; of abstract notions, sensations, propensities, and actions; of tutelary Numina, household or family gods; and of exalted men or heroes. Composed of such widely discordant elements, this great Hellenic pantheon offers yet a unity so harmonious and consistent in its minutest parts, that its origin is even more difficult to trace than that of the people itself, which, from a conglomeration of heterogeneous races and tribes was fused in an incredibly short space of time into one great family of equal propensities and of equal gifts. This question of the origin of the Greek religion has indeed been a point at issue from the time of Herodotus to our own. While he, together with many others, pronounced it to be almost completely an importation from Egypt, a strong autochthonic school held it to be homesprung; and these two antagonistic views—the east and Hellas—have, in a more or less modified form, found their foremost representatives in modern days, in Creuzer on the one side, and Otfried Müller on the other. The new and all-important science of comparative mythology, however, may be said to have set this point at rest; for it proves almost to demonstration, that the fundamental ideas of the Greek religion are due to the regions n.w. of India, the cradle of the main Hellenic stock (see ARYAN RACE); while subsequent colonists introduced gods from Peenicia, Egypt, and other parts of the east. All these, with the host of personified fancies and ideals begotten by the poets at home, were soon amalgamated into one great system. Yet those foreign elements, so far from detracting from the originality of the Greeks, show in a still stronger light what brilliancy of conception and power of imagination, what harmony and plasticity, had fallen to the share of the inhabitants of Hellas; a land which in itself, by the immense variety of glorious scenery of sea and sky, wood and mountain, river and bay, rock and island, contributed not a little to quicken that immortal youthfulness by which they were so aptly and strikingly called throughout the east the people of Yavan (Sanscr. *Yuvan* = *Juvenis* = *Young*). The gods, from the moment they touched these shores, from dead symbols became living realities, with all the qualities and sensations, aims and actions, of a living individuality, and that of the highest, most noble, and divine frame existing—man. Anthropomorphism, indeed, is the chief characteristic of Greek religion. The brute creation—which to the east was something to be exalted, and to be adopted as the type of divinity—furnished the Greeks only with a few attributes for their humanly-shaped gods. But man, the ideal of creation, was deficient in one thing: the duration of his life was limited—and in this the gods differed from him: they were immortal. In all other respects, they were like himself: they loved and hated, they "transgressed" and suffered. No ideal moral code existed with the Greeks, the first essentially ethical people though they are; consequently, their gods, when they could not attain the objects of their many and strong desires in a straightforward manner, had unscrupulous recourse to stratagem and cunning, and through their questionable practices, not unfrequently brought themselves into very undignified positions. And yet the influence of such unworthy conceptions of the gods was not so detrimental to the believer as at first sight might be supposed; for the Greek deities were not to be patterns for humanity; they were, through their mighty origin, their almost unbounded powers, and their immortality, exempt from the ordinary laws which must rule the dealings in the commonwealth of low, weak, dying humanity. They were a kind of exalted aristocracy, who could not be judged by a human standard, much less be imitated by human beings; and, after all, even they had to submit to a supreme fate (*Moira*) which found out their guilt, and punished it. The mortal, however, was subject to them individually; and it was his special province to fulfill the duties of piety and modesty towards them, of righteousness and justice towards his equals. On this condition alone, the undisturbed enjoyment of life with all its most glorious gifts was his. Retribution for evil doings followed, with rare exceptions, speedily and irrevocably, on the earth he trod, not at some future period or in other realms. There was a hereafter,

but it was a shadowy thing without life and blood, a miserable nether world of cheerless twilight. Only for very extraordinary crimes was there something like a real, fearful, and everlasting punishment in store in the hades, or the still more terrible tartarus; while, on the other hand, only the most exalted heroes are, after their death, endowed with a new body and enjoy the pleasures of elysium. But these are very exceptional cases: "When a man is dead," says the shade of Anticlea, "the flesh and the bones are left to be consumed by the flames, but the soul passes away like a dream."

We cannot attempt here to enter minutely into this vast subject of Greek theology—to trace its historical development from the days when the early Pelasgians invoked, like their Persian and German kinsman, the highest god without image or temple, and the minor deities as the "Great Ones," the "Unknown Ones," the "Merciful Ones," without distinct name and shape—to the time when every sound and every sight, every thought and every deed, had a sublime significance, caused and inspired as it was by a god; when the prodigious number of clearly defined, and individually and most sumptuously worshiped gods formed one of the mightiest impulses to the development of the arts; and from that period down to the days when the poets put prophecies of the speedy death of the gods into the mouths of their heroes; when philosophers openly declared "these things to be fancies and dreams," and religious persecutions hastened the downfall of a creed which had become adulterated by foreign elements no longer to be amalgamated—until Christianity stepped in, and not satisfied with deposing the gods of Greece, sent them, branded with the names of "evil powers," or "demons," in the sense of eastern "Satans," to perdition. Much less can we attempt here a minute enumeration and description of all the deities, their genesis and history, with the myths and legends, traditional or invented in historical times by poets and philosophers, or dwell on the immense influence of Greek religion on other religions, the Christian among them. It is only desirable here to trace a faint outline of the divine commonwealth, and the outward forms of the religious worship of the Greeks, in the so-called classical period. Some account of the principal deities will be found in special articles.

Without entering into the principal division of the gods into heavenly, terrestrial, and maritime, we will briefly mention the supreme council of the 12 national gods, who, together with a vast male and female retinue, dwelt on the heights of Mt. Olympus, around its highest peak. This, reaching into the sky, (Ouranos), was inhabited by Zeus, the son of Chronos, the highest, mightiest, and wisest being, king and father of gods and men: who watches over all human doings, principally over hospitality and the sacredness of oaths. Second in power is his brother Poseidon, the shaker of the earth, the ruler of the sea and all the waters of the earth. Next stands Apollo, the son of Zeus and Selo (darkness); he is (as Phoibos) the sun, and darts his rays or arrows as god of the chase, as god of destruction, as well as of beneficence. But he is not god only of the physical, but also of the mental light; hence to him belongs the insight into future events. He is the god of oracles, but, as such, equivocal (*loxias*); further, god of poetical inspiration, song, and music—leader of the muses. He is one of the sublimest figures among the gods. In his love and in his hatred, he is always enshrouded in a sacred dignity and majesty, of which even the most ribald fiction stood in awe. The god of the terrestrial fire, which in his person has been thrown from heaven to earth, is Hephæstus. His workshops are volcanoes, where metals are forged and wrought by him into artful forms; and as volcanic soil best matures wine, to him was assigned the office of cupbearer of the gods. Ares presides over war. Battles, slaughter, rapine, and the doom of cities are his delight. Hermes—originally, perhaps, the symbol of animal generation—appears as patron of the herds. He is the guardian of the roads and the messenger of the gods; he is, moreover, the inventer of the lyre and gymnastics. He is the presiding genius of commerce, and, as such, a knave, even a thief. With Zeus is coupled Hera, his sister and wife—beautiful, majestic, but exacting and quarrelsome. The foremost daughter of Zeus, and who sprang from his head in full armor, is Athene, who stands in a twofold relation to the light, physical as well as mental—whence she becomes the goddess of understanding and wisdom—and to the water (*Tritogeneia*); hence also her rivalry with Poseidon. The two elements, the warm and the moist, giving rise to the fertility of the earth, she is the goddess of the grain and of the crops; she is likewise goddess of war, and presides over female handiwork. Artemis, the twin-sister of Apollo, shares with him the chase and the light; her attributes are a torch and the moon. The Phenician goddess Astarte had risen from the foamy waves on the Greek shores as Aphrodite, the Greek goddess of beauty, of love, of voluptuousness. Her counterpart was the chaste maiden-goddess Hestia, in whom was personified the hearth as the center of the house and family. From the everlasting fire on her altar, the colonists took the flame which was to accompany them to their new settlements. The list of the Olympians closes with Demeter or Gaia. She is the goddess of agriculture, and, consequently, of settled institutions and laws.

An indefinite number of other gods followed, some of them little inferior in power and dignity to the 12, and who sometimes, like Dionysus, the god of goat-herds and wine growers, and others, acted as the special deities of certain classes. We may mention here Hades, Helios, Hecate, Leto, Dione, Persephone, Themis, Eos; the Charities, the Muses, the Moeræ, Proteus, the Nymphs, and other *daimons*—partly primeval local

deities, partly deified powers of nature; river, mountain, and forest gods; or personified abstract notions—such as Tyche, Psyche, Hebe, Thanatos, Phobos, Hypnos, Kratos, Bia, and the like conscious or unconscious allegories. Besides these, there is a mob of deities, or rather monsters, begotten by gods—the Harpies, the Gorgons, Pegasus, Chimæra, Cerberus, Scylla and Charybdis, the Centaurs, the Sphinx, etc.

A palpable link between gods and men is found in the heroes or demigods—i.e., men deified after death—a race sprung from the embraces of gods and the beautiful daughters of man. They became either, like Heracles (the Phenician Melkarth), founders of races, who were thus considered the sons of gods, or patrons of special trades and professions, like Dædalus, the *heros* of artificers and others. The entire absence of that dark and terrible, essentially eastern, notion of an evil principle, co-existent with the good, between which two rival powers the world is divided; the undaunted geniality of the Greek nature; the tendency towards humanizing the whole universe and its gods, who, again, had not disdained to ally themselves with mankind; and above all, the emancipation from an all-ruling hierarchy such as swayed the east, made the Greek religion dogmatically, as well as practically, one of the brightest and most joyous, no less than the mildest and most tolerant, of ancient creeds. The outward as well as the inward worship of the gods was with them purely a personal affair. No mediator stood between the individual and the deity; every freeborn man, woman, and child had the undisputed right to pray and to sacrifice when and where the heart prompted. The only office of the priests consisted in the care of certain sacred property, in providing for the service of the temple, in the performance of certain traditional rites, the recitation of certain ancient formulas handed down in the priestly families, and the expounding of the divine will expressed by oracles. The sacrifices (q.v.), which in earlier days had consisted in the votive offering of a lock, a garland, a tablet, or such simple fruits as were yielded by the soil, gradually, as hills and groves no longer sufficed, and temples, stately and sumptuous, adorned with gorgeous statues, had been erected, grew into splendid feasts, of which the gods were invited to partake, together with those who sacrificed. Of the periodical festivals held in honor of special deities, the games and sports, the scenic representations and musical contests connected with them, and of their peculiar influence in raising the literature, arts, and philosophy of the Greeks above that of all mankind, we have spoken under FESTIVALS, and we may further refer for particulars to such articles as DIONYSIA, PANATHENEIA, THESMOPHORIA, ELEUSINIAN MYSTERIES (where also the subject of the Mysteries is touched upon), as also to the headings OLYMPIAN, PYTHIAN, NEMEAN, and other GAMES.

One of the most characteristic provinces of the Greek cult was that belonging to the mantics or diviners. The Greek, looking upon the gods as his omnipresent friends, who were anxious to caution him against threatening dangers, or, in other words, firmly convinced by his own strong sympathy with nature, that a derangement of his own affairs, however unknown to himself, must produce a corresponding derangement in nature, could not but give some credence to the foreboding significance of natural or "supernatural" prodigies or signs. The ether or space between heaven and earth, would be the principal scene of these revelations; the storms that swept through it, the thunder that rolled around it, and the birds that floated in the blue abyss, were all so many divine omens. No less would the gods speak in the offerings immediately addressed to them—in the innermost entrails of the sacrificial animal—in the flame that rose from their altar—in dreams of the night, and strange sounds and portents by day; thus, in the midst of the assembled people, an ominous animal appeared, they speedily dispersed. Yet the free and clear Greek mind could hardly be suspected to have more than tolerated such practices, much less could it be supposed that it ever sank to the low level of groveling imbecility, as was the case in this matter of augury with the Etruscans (q.v.); and Homer—though to the astonishment of Xenophon—puts into the mouth of Hector the momentous words: "One omen only is significant—to fight for one's country!"

The growth of culture did indeed early free the Greeks from the vague awe of every-day phenomena, and the science of manticism fell accordingly into the hands of the lowest jugglers and soothsayers, believed in only by the herd. But in the same degree, there rose into highest importance another and exalted kind of prophecy—the oracles (q.v.). In this, the god Jupiter—afterwards principally Apollo, his son, the partaker in his counsels—spoke himself; first, in the rustling of leaves, in the clangor of brass basins, later, in distinct human words. He chose the weakest vessels—women, girls, to whom the divine gift was a burden and a pain. The Sibyl herself does not understand what the god says through her mouth; she is unconscious—in a state of somnambulism—of mania. But here the priests step in; they act as interpreters, as prophets, as *evangelides* (the progeny of some *evangelos*), "bringers of good tidings." Their influence, socially and politically, increased with that of the oracles themselves, especially when these latter, by degrees, from being casual and unforeseen, became frequent and regular. The richest gifts poured in from all parts, as it grew matter of piety to have recourse to them as means of grace. They thus rose into an institution, the importance of which, principally for the unity and consequent rise of Greece as a political power, cannot well be overrated. Besides the oldest oracle—that of Jupiter at Dodona—we may mention, out of the 260 which were counted throughout Greece,

those of Didyma, Delos, Abæ, Klaros, Larissa, Tegyra, of Trophonius—in a subterranean cavern—and of Amphiareus, near Oropus, in Attica, where the answers were revealed in dreams. But by far the most famous, and of highest import for the whole nation as such, was that of Delphi (q.v.), where the Amphictyonic council was held; where everything connected with the public worship throughout the country was settled; where the calendar itself was regulated; where, in fact, for a very long time was the real central power of Greece.—Its voice ceased under Julian the apostate.

GREEK WINES. The mountain ranges of Greece offer many declivities; sloping towards the south, most favorable to viticulture; but its vineyards have for centuries been much neglected, and the production of wine in Greece, which was considerable at the time of the Venetian supremacy, has sunk to a relatively insignificant amount. The production of currants, however, is still a highly important branch of Greek agriculture. The principal vines cultivated in Greece are the *vitis corinthiaca* or *apyrena*, the *Greco*, the *cipro*, the white and black *moscada*, the *malvasia*, the *sultana*, and the *assyrticon*. The vinification is very imperfect, and many wines contain so much acetic acid that they only last through the winter, and in summer turn into vinegar. To avoid this result the proprietors resort to smoking with wood smoke, or vapor of resins, which greatly injures their wine for foreign use. All provinces produce wine, but the best is that of Santorin, which is shipped largely to Russia. There is still a Malvoisie wine, though it is no longer that which was once so celebrated under the name of Malmsey; and the *Kephissia* wine of Attica and the red wine of Zante are in good repute. There has been a large increase in the number of vineyards since the kingdom began, and since 1858 a number of Greek wines have become of commercial importance. The best vineyards of Livadia are near Lepanto, Chæronea, Megara, and on the slopes of mount Poligouna. Achaia, the northern part of the peninsula Morea, has extensive vineyards near Patras, Blattero, Voltizza, and Kalavrito. Near the latter town is the convent of Megaspileon, where the monks make and keep wines in large quantities. The best wine of the Morea is made near Pergos. The volcanic island Santorin, ancient Thera, produces from 9,000 to 11,000 pipes annually. The best red growth is called *Santorin*, and among the white wines, *Thera*, *Calliste* and *St. Elie* are the best known. Besides these, there is a muscadine wine, named *Vin Santo*, made of two colors. Among the islands of the Archipelago producing wines or raisins are: Skopelos, Skiatho, Skyro, Mykonos, Negropont, Andro, Tino, Thermia, Naxia, and Amorgo. A considerable quantity of wine is produced by the Turkish islands, Candia and Rhodes, and by Cyprus which is now governed by Great Britain.

GREELEY, a co. in e. Dakotah, formed after the census of 1870; 750 sq.m. It is very little settled. It is mostly prairie, and the soil is fertile.

GREELEY, a co. in w. Kansas on the Colorado border; organized after 1870; about 700 sq.m. It is level and with very little woodland.

GREELEY, a co. in central Nebraska formed after the census of 1870: on the Loup, a branch of the Platte river; 576 sq.m.; pop. '76, 194. It has a prairie surface, and the soil is fertile. Co. seat, Lamartine.

GREELEY, a t. in Weld co., Col., on Cache river, and the Denver and Pacific railroad, 52 m. n.e. of Denver; pop. about 2,000. It is in a valley of rare fertility, and enjoys a very pleasant climate. The schools of the town are of a superior order, and there are many important manufactories. It was founded in 1870 by a colony mainly from New York, and every care was taken to prepare for a large city in the future.

GREELEY, HORACE, American journalist, was b. at Amherst, N. H., Feb. 3, 1811. His father was a farmer of small means: and Horace, after acquiring the rudiments of education at a common school, entered a printing-office as an apprentice, 1825, at Poultney, Vermont. On the completion of his apprenticeship, he worked for some time as a journeyman printer, and in 1834 commenced the *New Yorker*, a literary weekly paper, for which he wrote essays, poetry, and other articles. After one or two other essays at editorship, he began in 1841 the *New York Tribune*, of which he has ever since been the leading editor. As Mr. Greeley had adopted, to some extent, the social theories of Fourier, he was joined by the most able writers of that school of socialism, and the paper is published as a joint-stock concern, being held in shares by its writers and others engaged in its publication. The *Tribune* has also been an earnest advocate of temperance, women's rights, the abolition of slavery and capital punishment, and other reforms, and is recognized as the organ of the extreme or radical republican party. In 1848 Mr. Greeley was elected to congress from one of the districts of New York, for the short term, but failed in his congressional career by agitating an unwelcome reform in the mileage payments to members. In 1851 he visited Europe, and was chairman of one of the committees of the great exhibition. His aspirations to political position were defeated by the more conservative party leaders, and he, in turn, is supposed to have secured the election of Mr. Lincoln, instead of Mr. Seward, in 1860. On the secession of several of the southern states from the union, Mr. Greeley at first advocated their right to secede, in accordance with the principles of the Declaration of Independence: but when the war began, he became one of its most zealous advocates, and is supposed to have caused the premature advance that resulted in the defeat of

Bull's Run, July 21, 1861. In 1872 he was an unsuccessful candidate for the presidentship, and died the same year.

GREELEY, HORACE (*ante*), the eminent American journalist, never enjoyed the advantages of collegiate education, but he was an apt scholar and made the most of such opportunities for acquiring knowledge as were within his reach. His father was a poor, unprosperous farmer, and the boy, in his earliest years, was put to hard work. But he had an insatiable fondness for books, and every minute that he could spare from work or sleep was devoted to reading, and what he read he remembered. He neither shirked nor slighted any task, but did properly and well whatever the needs of the family required at his hands, the hope of finding time for reading acting as a constant stimulus to his fidelity. He made more of the scanty advantages of an ill-furnished country printing-office than some young men do of the opportunities afforded by a richly endowed college. The offer of "leading men in the neighborhood" to bear his expenses in a college course was doubtless declined by his parents not from any lack of appreciation of the advantages of such an education, but partly because they needed his services at home and partly on account of the pride which would not permit them to receive such a boon as an act of charity. However this may be, it is to be lamented that a man so richly endowed by nature did not receive the best education the country could furnish. His early interest in political, industrial, and social questions was fortunate, for it was this that led him to qualify himself for a career of eminent usefulness. He brought to the discussion of such topics not the ambition of an office-seeker or the arts of the demagogue, but a strong desire and purpose to secure the highest welfare of the whole people. If he was not always right on current questions, nor always free from the impetuosity which too often mars the efforts of reformers, he discussed those questions with a vigor and intelligence not often exhibited by the conductors of political journals in his day. A high moral purpose was at the bottom of every form of political and social activity to which he lent his support. He was a partisan, with many of the faults which must ever spring from that bitter root, but few men have ever enjoyed in a higher degree than himself the respect and confidence of his political opponents. When he came to New York in 1831, a boy of 20 years, poorly clad, with only $10 in his pocket, his aspirations were of the noblest sort, his character unsullied, his mind well informed upon many subjects of the highest interest. Every step from the obscurity of that period to the eminence he afterwards attained was perfectly natural. The *Morning Post*, the first penny daily ever published, was marked by that genius for editorship which he possessed in so high a degree. It failed not for lack of intellectual strength. *The New Yorker*, which lived for seven years and was finally merged in the *Weekly Tribune*, was confessedly the best literary newspaper in America at that period. The *Log Cabin* showed for the first time how a campaign paper may be made a vehicle of instruction as well as a means of political excitement. These all, naturally enough, prepared the way for *The Tribune*, which was founded in 1841, and which is the noblest monument to his fame. In his *Recollections of a Busy Life* he says: "Fame is a vapor; popularity an accident; riches take wings; the only earthly certainty is oblivion; no man can foresee what a day may bring forth, while those who cheer to-day will often curse to-morrow: and yet I cherish the hope that the journal I projected and established will live and flourish long after I shall have molded into forgotten dust, being guided by a higher wisdom, a more unerring sagacity to discern the right, though not by a more unfaltering readiness to embrace and defend it at whatever personal cost; and that the stone which covers my ashes may bear to future eyes the still intelligible inscription, Founder of the *New York Tribune*." In 1848 he was elected to congress to fill a vacancy, serving from Dec. 1 of that year to March 4, 1849. He distinguished himself by an uncompromising but unpopular war against the abuses of the mileage system, thereby incurring the bitter hostility of not a few of his own party. In this as in many other instances he was careless of his own popularity and bent only upon promoting the public welfare. He was warmly interested in every movement which seemed to him likely to improve the condition and enlarge the opportunities of the toiling poor, and his paper was ever open to the consideration of such themes. When the North American Phalanx was organized, in 1843, near Red Bank, N. J., in part upon the principles of Charles Fourier, the French socialistic reformer, he gave it such aid as lay in his power. He opened the columns of *The Tribune*, to a limited extent, to an exposition and defense of Fourier's general plan, though dissenting very earnestly from some of his doctrines. He was intolerant of every assault upon the institution of the family, prompt to denounce every sentiment and practice inconsistent with the highest standard of social purity. He was quick to discern and point out the evils and abuses of existing institutions, but he was neither a revolutionist nor an iconoclast. He recognized the law of growth and development in human society, and, having done what he could to diffuse right principles, awaited the result with a cheerful confidence in the Providence that watches over human affairs. He lectured much in different parts of the country, generally upon topics of social and political reform; and, though utterly destitute of the qualities of an orator, the respect entertained for his character and opinions was always sure to command for him a wide and favorable hearing. Agricultural and manufacturing industries engaged much of his attention, and few men in his day did

more than he to promote their development. He served as one of the American jurymen at the great London exposition of 1851, and before returning home traveled through France, Italy, and Great Britain. In 1855 he went to Europe for the second time, spending six weeks in Paris, where he was imprisoned for two days, being prosecuted by a French sculptor, to recover compensation for damages done to a statue in the New York world's fair of 1853, of which he was a director. He was liberated in the regular course of judicial proceedings. If he had depended for his freedom upon the clemency of the emperor, his imprisonment would in all probability have been prolonged; for that monarch could hardly have been expected either to forget or forgive the American editor who had so conspicuously and persistently denounced as an indescribable infamy the *coup d'état* of 1851. Though not in the technical sense of the word an abolitionist, Mr. Greeley was an opponent of slavery, and foremost among those who sought to resist its extension to the territory acquired from Mexico. From 1850 to the end of the conflict, *The Tribune*, under his direction, did much to inform and invigorate the anti-slavery sentiment of the northern people, and to prepare them for the great struggle that ensued. When, after the election of Lincoln in 1860, the south threatened to secede from the union, he frankly declared that if a majority of the people of any state, after full and free discussion, should sincerely and deliberately vote to withdraw, he was willing they should do so. But he held that the votes actually taken at the south did not express the real convictions of the majority, but were the result of terrorism and panic; and when the rebellion broke out, he lent his voice and influence to the support of the government in its efforts to suppress it by force. He had a keen sense of the horrors of a civil war, and was willing to adopt any reasonable and rational plan to avert them. His belief was that if any of the states should deliberately decide to secede, they would soon come to their senses and return to the union, and that this would be better than war. But when nearly the whole south gave itself up to the frenzy of secession and rebellion, he saw at once that the north had no other honorable alternative than a prompt and forceful resistance. The war once begun, he was in favor of its vigorous prosecution, and impatient with what seemed to him unreasonable slowness on the part of the government. At times he was much discouraged, and disposed to think that, to avoid worse calamities, the war should be ended by some compromise short of the result most to be desired. It was this feeling that made him willing to go to Canada, in 1864, with the unofficial sanction of Lincoln, to hold a fruitless conference with George N. Sanders, Jacob Thompson, and Beverly Tucker, the confederate agents on the subject of peace. At the close of the war he advocated the doctrine of universal amnesty and universal suffrage. In other words, he held that there should be no civil penalties inflicted upon those who had taken part in the rebellion, and that negroes should be admitted to vote on equal terms with the whites. He held that the prolonged imprisonment of Jefferson Davis, without indictment or trial for any offense, was a palpable infraction of the sixth amendment of the constitution, which declares that "in all criminal prosecutions the accused shall enjoy the right to a speedy and public trial by an impartial jury of the state and district wherein the crime shall have been committed;" that the government was bound either to try or release him at once; and that to make a martyr of him by an imprisonment not warranted by law was a gratuitous aggravation of the obstacles to reconstruction, and a stigma upon the character of the republic. He therefore joined with Gerrit Smith and others in signing the bail-bond of Mr. Davis, whereby he and they became responsible to the government for his appearance to answer any indictment that might be found against him. This act, in the then state of public sentiment at the north, brought upon him much odium, but he was always proud of it as right in itself and calculated to promote the best interests of the country. It certainly was an act which demanded a high degree of moral courage for its performance. In 1861, not by any agency of his own, but doubtless with his own consent, he was a candidate for the republican nomination for U. S. senator, but was defeated by Ira Harris. In 1864 he served as a presidential elector, voting for the re-election of Lincoln. In 1869 he was the republican candidate for comptroller of the state of New York, but was defeated, the democrats being then in power in the state. In 1870 he was a candidate for congress in the 6th New York district, but without any chance of success, the district being overwhelmingly democratic. He ran 300 votes ahead of the republican state ticket. It is said by men who shared his confidence, that while he was too proud to be an applicant for any office or to take any step to secure a nomination, he yet very keenly felt the neglect of others to recognize his honorable claims for promotion upon the parties he served so faithfully and well. This view of his character finds striking confirmation in a private letter addressed by him, Nov. 11, 1854, to gov. Seward. When, in 1860, Mr. Seward, largely no doubt through Mr. Greeley's influence, failed of a nomination for the presidency, he permitted his friends to make public allusions to the contents of this letter as affording evidence that Mr. Greeley's opposition to himself was of a selfish and personal character. Mr. Greeley thereupon demanded the publication of the letter, in which, under the seal of privacy, he reminded gov. Seward of what he had done for the whig cause in 1838, and then said: "I was a poor young printer. . . . I did the work required to the best of my ability, and I did it well. When it was done, you were governor, dispensing offices worth $3,000 to $20,000 per year to your friends and compatriots. I

returned to my garret and my crust, and my desperate battle with the pecuniary obligations heaped upon me by bad partners in business and the disastrous events of 1837. I believe it did not then occur to me that some one of those abundant places might have been offered to me without injustice; I now think it should have occurred to you." And then he referred to his services for the party in the Harrison campaign of 1840, which had been requited after the same fashion. After the election was over, he says, "came the great scramble of the swell mob of corn minstrels and cider-suckers at Washington, I not being counted in. . . . I asked nothing, expected nothing; but you, governor Seward, ought to have asked that I be postmaster of New York." It was for reasons such as these that he notified gov. Seward of "the dissolution of the political firm of Seward, Weed, and Greeley, by the withdrawal of the junior partner," and the breach thus made was never healed. In 1872 Mr. Greeley was opposed to the renomination of gen. Grant for a second term, and co-operated with a body of "liberal republicans," who held a convention in Cincinnati, on the 1st of May, in advance of the regular republican convention, to nominate another candidate. On the 6th ballot the nomination fell to Mr. Greeley, and was by him accepted. The platform of the "liberal republicans" affirmed in their entirety and in vigorous terms the cardinal principles of the republican party itself. It recognized the equality before the law of all men, of whatever nativity, race, color, or persuasion; it pledged its supporters to maintain the union, emancipation, and enfranchisement, and to oppose any re-opening of the questions settled by the latest amendment to the constitution; it demanded the immediate and absolute removal of all disabilities imposed on account of the rebellion, in the belief that universal amnesty would result in the complete pacification of all sections of the country; it declared that local self-government, with impartial suffrage, would guard the rights of all citizens more securely than any centralized power; it declared that the public welfare required the supremacy of the civil over the military authority; freedom of persons under the protection of habeas corpus, and a return to the methods of peace and the constitutional limitations of power; it demanded a thorough reform of the civil service, which had become a scandal and reproach upon free institutions, and a source of demoralization dangerous to the perpetuity of republican government; and, finally, it declared that the public credit must be sacredly maintained, denounced repudiation in every form and guise, and demanded a speedy return to specie payment, as demanded alike by the highest considerations of commercial morality and honest government. Upon this basis the convention invited the co-operation of all patriotic citizens without regard to previous affiliations. Whatever may be the judgment of posterity as to the wisdom of Mr. Greeley in allowing himself under the circumstances to be made a candidate for president upon such a platform, it is only just to say that he understood himself to have reaffirmed the very principles for which he had contended as a republican, and to have neither made nor proposed any concession whatever to those who had opposed and resisted them. When the democratic party adopted that platform in its entirety and without qualification, and nominated him as their candidate for president, he accepted their action as the sign and pledge of a new departure, and believed that if he should be elected there would be an end of all political schemes having their root in the spirit of slavery and calculated to array the south against the north. Whether he was or was not deluded in this regard, there is no reason to doubt his entire sincerity and good faith in the course he pursued. Nor is there any reason to wonder that he was deeply wounded, disappointed, and mortified in finding himself accused by many of his old friends of having thrown away his principles and entered into a foul conspiracy to turn over the government of the country to the control of the men who had instigated the rebellion. It may be said that this accusation was alike natural and plausible, and that it was a weakness on his part not to have anticipated it; and perhaps this is all true. But those who stood near him in that conflict affirm that it was not his defeat as a presidential candidate, but the cruel impeachment of his integrity by old friends, that wounded his spirit past all healing. The popular vote cast for him amounted to 2,834,079, against 3,597,070 for gen. Grant; but the only states carried by him were Georgia, Kentucky, Maryland, Missouri, Tennessee, and Texas.

He had overtasked his powers for many years. Near the close of the campaign he was required to watch at the bedside of his dying wife. During the whole contest his powers of endurance were strained to the utmost, and when it was at last over, he was prostrated by a disorder of the brain and sank rapidly into the arms of death. The sad event made a very profound impression upon the country, and showed how deeply he was admired and loved by good men of all parties and every variety of opinion. His body lay in state in the city hall for one day, where it was visited by a vast multitude of people, many of whom lingered for hours in the slow-moving procession for an opportunity to look upon his dead face. His funeral was simple but very impressive, and was attended by the president and vice-president of the United States, and many other persons of distinction. He died as he had lived, in the faith of Universalism. His published volumes are as follows: *Hints Toward Reforms* (1850); *Glances at Europe* (1851); *History of the Struggle for Slavery Extension* (1856); *Overland Journey to San Francisco* (1860); *The American Conflict* (2 vols., 1864–66); *Recollections of a Busy Life* (1868); *Essays Designed to Elucidate the Science of Political Economy* (1870); and *What I*

Know of Farming (1871). His life was written by James Parton in 1855, and a new edition appeared in 1868.

GREEN, a co. in s. central Kentucky on Green river; 525 sq.m.; pop. '70, 9,379—1937 colored. It has a hilly surface, and is largely covered with forests. The main productions are tobacco. wheat, corn, oats, and butter. Co. seat, Greensburg.

GREEN, a co. in s. Wisconsin, on the Illinois border, drained by Sugar and Pecatonica rivers, and reached by a branch of the Milwaukee and St. Paul railroad; 576 sq.m.; pop. '70, 23,611. The surface is diversified with hills and prairies, and timber is plenty. The main productions are wheat, corn, oats, hay, butter, and pork. Co. seat, Monroe.

GREEN, ASHBEL, D.D., LL.D., 1762–1848; b. N. J.; educated in the college of New Jersey. He was tutor and professor of mathematics and natural philosophy at Princeton; Presbyterian pastor in Philadelphia; member of the general assembly; chaplain to congress, and one of the founders of the first Bible society in the country—in Philadelphia. From 1812 to 1822 he presided over the college of New Jersey, and for 12 years afterwards was editor of the *Christian Advocate*. He and others originated the now famous theological seminary in connection with the college at Princeton. Besides these he filled several other important offices, and had great influence in the affairs of his denomination. He published a history of Princeton college, and a few lectures.

GREEN, BARTHOLOMEW, 1666–1732; b. Mass.; the first printer of a regular newspaper in North America (see AMERICAN JOURNALISM). In 1704 he started a small weekly, the *Boston News-Letter*, which he continued as long as he lived.

GREEN, DUFF, d. 1875; long known in Washington as the editor of democratic newspapers. He was a warm supporter of president Jackson, and so extreme in his methods of expression that he became involved in a number of duels, one of which was with James Watson Webb, editor of the *New York Courier and Enquirer*. None of Green's duels had any very serious results.

GREEN, HENRY WOODHULL, LL.D., b. N. J., 1804; graduated at Princeton, and soon became an eminent lawyer. In 1846 he was made chief justice of the state supreme court, and in 1860 chancellor. In 1867 he was on a commission to codify the laws of the state. He was at one time president of the board of trustees of Princeton theological seminary.

GREEN, HORACE, LL.D., 1802–66; b. Vt., and educated at Middlebury college; studied medicine and practiced in his state; finally settled in New York, and completed his medical studies in Paris. He was professor in a medical college at Castleton, Vt. In 1850 he was one of the founders of the New York medical college, became one of the faculty, and was professor of the theory and practice of medicine. He published a number of works chiefly on diseases of the air passages and lungs, and *Selections from the Favorite Prescriptions of Living American Physicians.*

GREEN, JACOB, 1722–90; b. Mass.; educated at Harvard and Princeton, and in 1745 licensed to preach by the New York presbytery. In 1757 he was vice-president of Princeton college. In 1775 he was a member of the provincial congress, and chairman of the committee that drew up the state constitution. Among his works are *A View of the Constitution of the Jewish Church*, and *A View of a Christian Church and Church Government.* His autobiography was published by his son.

GREEN, SAMUEL, 1615–1702; b. England; one of the first printers in the English American colonies, succeeding Stephen Day at Cambridge, Mass., in 1648. He printed the Bible, the colonial laws, Baxter's *Call*, and several other works in the Indian language for John Eliot, the missionary.

GREEN, SETH, b. New York, 1817; especially noted for his efforts in fish culture. He entertained the idea of cultivating or breeding the better kinds of fish to stock lakes and streams then barren. After many experiments he succeeded in hatching enormous numbers from the spawn of shad, trout, and other kinds, with which he stocked the Connecticut, the Hudson, the Potomac, the Susquehanna, and a great number of less important streams. His work became so popular that state associations were formed to further his purpose, and honors from France and other countries were awarded to the originator. He has published one or more works on the subject of fish culture. For several years he has been commissioner of fisheries of the state of New York.

GREEN, WILLIAM HENRY, D.D., LL.D., b. N. J., 1825; graduated at Lafayette college, Penn., and studied at Princeton theological seminary, where he was teacher of Hebrew. In 1848 he became a Presbyterian minister, and pastor of the Central church in Philadelphia the next year. In 1851 he became professor of Hebrew and Old Testament literature in Princeton theological seminary. In 1868 he was elected president of the college of New Jersey, but declined the office. He is one of the committee on the new English translation of the Bible. His publications are *Hebrew Grammar; Hebrew Chrestomathy; The Pentateuch Vindicated;* and *The Argument of the Book of Job Unfolded.*

GREEN, WILLIAM MERCER, D.D., LL.D., b. N. C., 1798; graduated at the state university, and was ordained in the ministry in 1820. In 1849 he was chosen bishop of Mississippi (Prot. Epis.). He was one of the promoters and founders of the university of the south at Suwanee, Tenn., and chancellor thereof. His main work is *Sermons on Apostolic Succession and Baptismal Regeneration.*

GREEN'BACKS. During the civil war in America from 1861 to 1865, the immense expenditure of the U. S. government led to the printing of an unprecedented number of bank-notes, bonds, and currency papers of various kinds. These documents, from the color presented by them, or some of them, obtained the name of *greenbacks*, a designation which became almost as familiarly used in congress as among the general public. At first, the manufacture of these notes taxed the resources of the government in a very embarrassing way; and there was ample reason to suspect that forged notes and bonds were abundantly in circulation; but, by degrees, a fine and large establishment was organized at Washington, under the immediate control of the secretary of the treasury. In this establishment, everything was conducted from first to last; rags, fibers, plates of steel, and colors were taken in, and finished notes were sent out. It was only under very rare circumstances that strangers were admitted to view the operations; but one such occasion, in 1864, led to a general description of the place being given in most of the newspapers, from which it was copied into some of the English scientific journals.

Speaking of the establishment as it was in 1864, and not touching upon any of the modifications which may since have been introduced, there were distinct and separate departments for mechanical repairs, paper-making, ink-making, paper-wetting, plate-engraving, printing, numbering and denominating, and cutting. In the paper-mill, all the paper for the greenbacks was made, with a degree of scrupulous attention and uniformity that cannot always be insured in a private establishment. It was necessary to have a paper that would wear well, would not split easily, and would be sufficiently non-photographic to baffle a forger. Dr. Gwynn made many experiments, with a view to attain excellence on these points; and at length he produced a kind of paper nearly as strong as parchment and as smooth as satin. The nature of the material was known only to himself and the government. There was a fiber in the paper, quite molded or felted into its substance, which could not be photographed without discoloring the sheet to which it was transferred, giving it the appearance of a coarse, black spider-web, which would instantly have betrayed the forgery. In another department, the ink was made by means of grinding-machines, one for each of the several colors used in the various kinds of notes and bonds. While these operations of paper-making and ink-making were in progress, the engraving of the plates was conducted in another department. The steel-plates were engraved with the most minute and intricate devices which the hand and the eye of the artist could execute: it mattered little what device was selected, provided it were difficult for a forger to imitate. One particular note was, in its main features, an engraved copy of a picture in the rotunda of the capitol at Washington; and the engraving is said to have occupied a whole year to execute. All the devices, of whatever kind, were made to co-operate with delicate water-lines in the paper, to render forgery difficult. As the plates were costly to engrave, and fitted to yield only a certain (though large) number of impressions each, a mode of multiplication was adopted which had for many years been largely used in England. The processes were thus connected: 1. The engraver executed the design on a smooth plate of soft steel. 2. The plate was hardened by well-known processes of heating and cooling. 3. A roller of soft steel was pressed with immense force over the hardened plate, and took upon its surface the device in *relief:* as the roller was equal in length to the length of the plate, and equal in circumference to its breadth, the curved surface exactly took in the whole of the device. 4. The roller was hardened. 5. The hardened roller was used as a matrix to produce any number of plates in soft steel, which had the device in *intaglio*, like the original plate. 6. These plates, when hardened, were used to print from.

The paper, the ink, and the plates being thus prepared, all was ready for the printing. In the earlier period of the working of the establishment, presses were used such as are generally employed by copperplate printers; each press attended by a woman to place and remove the paper, and a man to manage the inking and the pressure; but afterwards, a large room was filled with hydraulic printing-presses, which conducted the operations much more rapidly. The notes, as fast as printed, were interleaved with sheets of thin brown paper, to prevent blurring. In numbering and denominating the notes, a yellow mordant was employed, of such kind that the note could not be photographed without producing a black impression from the yellow portion. The numbering-machine was worked by a treadle; there were six disks with figures on their edges, and they so acted on each other by means of ratchets, that they could print any number from 1 to 999,999. For consecutive numbering, the machine adjusted its own figures after each printing. The notes were usually printed four on a sheet, and were afterwards severed and trimmed by a cutting-machine, which made them all precisely equal in size and shape. So complete was the check established in all the operations, that "not even a blank sheet," said a narrator, "much less a printed one, is passed from one hand to another without being counted and receipted for; and unless there is collusion from one to another in every process through which the paper has to pass before it is finished, there cannot be an over-issue. The paper is issued from one room, and is re-issued from that room sixteen or eighteen times before it is put into circulation; being counted, charged, and receipted for each time, and recounted, recharged, and re-receipted for through each process that it passes after leaving that room." For the English system, see BANK-NOTES.

GREEN BAY, a branch of lake Michigan running s.s.w. into Wisconsin nearly 100 m. having a breadth of 10 to 20 miles. The largest stream falling into the bay is Fox river at the extreme s. end.

GREEN BAY, a city in Brown co., Wis., on Fox river and Green bay, on the Chicago and Northwestern, the Wisconsin Central, and the Green Bay and Minnesota railroads; pop. '75, 8,037. There is a good harbor, a bridge over the river, a court house, a high school, a Roman Catholic academy and convent, and residence of a bishop of that church; many iron works, mills, and factories. Lumber is one of the great articles of trade, and the grain traffic is also large. The French settled here in 1745; the city was incorporated in 1854.

GREENBRIER, a co. in s.e. West Virginia, on Meadow and Greenbrier rivers, and the Chesapeake and Ohio railroad, n.w of the Alleghany mountains; 880 sq.m.; pop. '70, 11,417—1103 colored. The surface is rough with good timber. Corn, wheat, oats, and hay, are the main products. White Sulphur Springs in this co. is a favorite resort in the summer season. The co. is crossed by Greenbrier river, the chief tributary of the Great Kanawha, and by sections of the Greenbrier mountains. Co. seat, Louisburg.

GREENBUSH, or EAST ALBANY, a village in Rensselaer co., N. Y., on the Hudson river opposite Albany, to which city there is the bridge of the New York Central railroad; pop. of township '75, 7,066. The Boston and Albany, and the Troy and Greenbush railroads terminate here. The main business is with railroad affairs, such as freight depots, machine shops, etc. There are some other manufactories.

GREENCASTLE, a city in Putman co., Ind., on the Louisville, New Albany and Chicago railroad, at the junction of St. Louis and Terre Haute, and Indianapolis roads, 38 m. w. of Indianapolis; pop. (with township) '70, 3,227. There are some important manufactories in the village, and it is the seat of the Indiana Asbury university (Meth. Epis.), the Indiana female college, and a Presbyterian educational institute. There are manufactures of iron, pumps, machinery, etc.

GREEN CLOTH, BOARD OF; a board connected with the royal household, consisting of the lord steward and inferior officers, which has power to correct offenders within the verge of the palace, and two hundred yards beyond the gates. A warrant must be obtained from this board to enable a servant of the palace to be arrested for debt.

GREEN COLORS. Although every shade of green can be produced both in oil and water-colors, and also in dyeing, most of them are made by mixing the various yellow and blue materials in different proportions. The following are the green paints in use:

Arsenical green, or Scheele's green, is an arsenite of copper, made by dissolving arsenious acid in a solution of potash, and adding it to a solution of sulphate of copper. A precipitate is formed, which is *Scheele's green*, or *Mitis green*.

Brunswick green.—The best is crude oxychloride of copper, but the kind commonly sold is a mixture of carbonate of copper and chalk, or pipe-clay. One shade of this mixture is sometimes called *Bremen green*.

Chrome green is a mixture of Prussian blue and chrome yellow.

Copper green is sometimes a natural product, but is more generally manufactured; it is the oxide or the carbonate of copper, and is sometimes called *green bice* or *mountain green*.

Emerald green is an arsenite of copper, prepared by a slightly different process to *Scheele's green*.

Frise or *Friesland green* is made with sulphate of copper and sal-ammoniac.

Gellart's or *Gellert's green* is amixture of *cobalt blue*, flowers of zinc, and *chrome yellow*.

Sap green—the juice of buck-thorn berries fermented for seven or eight days, after which a little alum is added; and when evaporated to a thick consistency, it is pressed into bladders, and hung up until entirely dry. It is chiefly employed in water-colors.

Schweinfurth green is another form of the arsenite of copper produced by dissolving separately equal parts of acetate of copper and arsenious acid. The solutions are then added together quite hot, and the precipitate formed is the beautiful but highly dangerous pigment. Its great beauty has led to its frequent employment in coloring wall-papers, artificial flowers, and even in some cases, it is to be feared, in coloring sugar-confections.

All of these colors, with the exception of sap green are dangerously poisonous.

Green, in dyeing, is always understood to be a mixture of the two colors blue and yellow. The materials are generally mixed first with blue, and afterwards with yellow, proportioning the intensity of each to the shade of color required.

The Chinese have a vegetable green color called *luh-kao*, or green indigo, but it is exceedingly costly, and is only obtainable in very small quantities.

GREENE, a co. in n.w. Alabama between the Tombigbee and black Warrior rivers, crossed by the Alabama and Chattanooga railroad; 750 sq.m.; pop. '70, 18,399—14,541 colored. The surface is generally level, with a large proportion of woodland; soil fertile, and chief productions corn and cotton. Co. seat, Eutaw.

GREENE, a co. in n.e. Arkansas on the border of Missouri, between the Cache and St. Francis rivers; reached by the Cairo and Fulton railroad; 950 sq.m.; pop. '70, 7,573

—156 colored. The surface is low and level, producing corn and cotton. Co. seat, Gainesville.

GREENE, a co. in n. Georgia on the Appalachee and Oconee rivers, crossed by the Georgia railroad; 374 sq.m.; pop. '80, 17,547—11,969 colored. The surface is hilly, and the soil is much worn from long cultivation. The main products are cotton and corn. Co. seat, Greensborough.

GREENE, a co. in w. Illinois, e. of Illinois river, intersected by the St. Louis, Rock Island and Chicago, and the Chicago and Alton railroads; 500 sq.m.; pop. '80, 23,014. The surface is varied, and in some parts hilly, with forests of oak, hickory, and other valuable trees. Corn, wheat, and pork are the principal products. There are good beds of soft coal, and fine limestone for building. Co. seat, Carrollton.

GREENE, a co. in s.w. Indiana on the w. fork of White river, crossed by the Indiana and Vincennes, and the Bedford, Springfield, Owensburg and Bloomfield railroads; 540 sq.m.; pop. '70, 19,514. The surface is generally level and covered to a large extent with forests. The soil is fertile, producing wheat, corn, oats, etc. There are some coal mines. Co. seat, Bloomfield.

GREENE, a co. in w. central Iowa on Raccoon river, crossed by the Chicago and Northwestern, and the Des Moines and Ft. Dodge railroads; 576 sq.m.; pop. '75, 7,028. It has a prairie surface partially covered with forests, and a fertile soil. Chief productions corn, wheat, oats, and hay. Co. seat, Jefferson.

GREENE, a co. in s.e. Mississippi, on the Alabama border, drained by the Leaf and Chicasaw rivers; 825 sq.m.; pop. '70, 2,038—372 colored. The surface is for the most part covered with forests, and the soil is poor. Co. seat, Leakesville.

GREENE, a co. in s.w. Missouri on James and Sac rivers, crossed by the St. Louis and San Francisco railroad; 660 sq.m.; pop. '70, 21,549—2,156 colored. It has an undulating and hilly surface, to a considerable extent covered with forests. The soil is good, producing corn, oats, wheat, etc. Co. seat, Springfield.

GREENE, a co. in e. New York on the n. side of the Hudson river, drained by the Schoharie and Catskill creeks; area 600 sq.m.; partially crossed by a branch of the New York Central railroad; pop. '75, 31,832; in '80, 34,625. The surface is tolerably level near the river, but further w. rises into the Catskill range of mountains, some of which are 2,000 to 3,000 ft. above tide. (See CATSKILL MOUNTAINS.) Some cereals are raised, but the land is better adapted to pasturage. Geologically the rocks in this co. are especially interesting. Co. seat, Catskill.

GREENE, a co. in e. central North Carolina, drained by stream running into Neuse river; 300 sq.m.; pop, '70, 8,687—4,521 colored. It has a level surface partially covered with forests, and the soil is in some parts fertile. Corn and pork are the chief productions. Co. seat, Snow Hill.

GREENE, a co. in s.w. Ohio on Little Miami and Mad river, crossed by the Pittsburgh, Cincinnati and St. Louis railroad; 430 sq.m.; pop. '70, 28,038. The surface is undulating or hilly, and forests are abundant. The soil is good; chief productions, corn, wheat, oats, and pork. Co. seat, Xenia.

GREENE, a co. in s.w. Pennsylvania on the West Virginia border, w. of the Monongahela river and drained by the Wheeling and Ten Mile creeks; 620 sq.m.; pop. '70, 25,887. It has a rough and hilly surface with considerable forests. The soil is good; corn, wheat, hay, oats, and pork are the staple products. Co. seat, Waynesburg.

GREENE, a co. in e. Tennessee on the North Carolina border, drained by affluents of French Broad river, and crossed by the East Tennessee, Virginia and Georgia railroad; 750 sq.m.; pop. '70, 21,688—2,064 colored. The surface is in part mountainous but the valleys are fertile, producing corn, wheat, oats, etc. There are iron mines, and beds of limestone. Co. seat, Greenville.

GREENE, a co. in n. central Virginia between the Blue Ridge and the Rapidan river; 220 sq.m.; pop. '70, 4,634—1,452 colored. Surface is rough, with fertile valleys; chief products, corn, wheat, and oats. Co. seat, Stanardsville.

GREENE, CHARLES GORDON, b. N. H. 1804; apprentice to his brother Nathaniel. In 1825 he published at Taunton, Mass., the *Free Press;* in 1826, the *Boston Spectator;* then returned to the *Boston Statesman;* in 1828, was one of the editors of Duff Green's paper, the *Telegraph* of Philadelphia; succeeded his brother as editor of the *Boston Statesman;* and in 1831 began the *Boston Post,* a strongly democratic daily and weekly, which he edited until his death.

GREENE, CHRISTOPHER, 1737-81; b. R. I.; an officer in the revolutionary army rising to lieut.col. He went with Arnold through the wilderness and was taken prisoner at Quebec, but was soon exchanged. He defended Fort Mercer (at Red Bank on the Delaware) Oct. 21, 1777, against the Hessians who were repulsed and their commander killed. In May, 1781, he was surprised in his quarters on Croton river by a force of refugees and killed.

GREENE, GEORGE WASHINGTON, b. R. I., 1811; studied at Brown university, and resided for some time in Europe. In 1837–45 he was U. S. consul at Rome, and in 1872 he was made professor (non-resident) of American history in Cornell university. His principal works are *Ancient Geography; History and Geography of the Middle Ages; Life of Gen. Nathaniel Greene* (his grandfather); *Historical View of the American Revolution;* and *Biographical Studies.*

GREENE, NATHANIEL, an American revolutionary gen., b. May 27, 1742, at Potowhommet, Warwick co., R. I. His father was a leading preacher among the Quakers, and educated his son very simply, training him from childhood to work on his farm, and at his anchor-forge and grist-mill. By his own perseverance, however, he acquired considerable knowledge of ancient and English history, geometry, law, and moral and political science; he was also fond of reading books upon war. In 1770, he was chosen a member of the Rhode Island assembly, and, to the great scandal of his fellow Quakers, was among the first to engage in the military exercises preparatory to resisting the mother-country. In 1774 he enlisted as private, and in 1775 was appointed to the command of the Rhode Island contingent to the army at Boston, with the rank of brig.gen. He was promoted to be maj. gen. in 1775, and distinguished himself at the engagements of Trenton and Princeton. At the battle of Brandywine, he commanded a division, and by his skillful movements saved the American army from utter destruction; and at Germantown he commanded the left wing. In 1778 he accepted the office of quartermaster-gen. In 1780 he succeeded Gates (q.v.) in the command of the army of the south. Gates had just been completely defeated by Cornwallis, and Greene found the army in a wretched state, without discipline, clothing, arms, or spirit. By dint of great activity, he got his army into better condition, and remained on the defensive for the remainder of the year. In 1781 he had a successful skirmish with an English detachment, but drawing upon himself the whole army of Cornwallis, much his superior in numbers, he made a masterly and successful retreat. With 5,000 new recruits he entered upon more active operations, and finally defeated the English at Eutaw Springs, the hardest fought field of the revolution, which put an end to the war in South Carolina. Congress struck, and presented to him, a medal in honor of this battle, and the Carolinas and Georgia made him valuable grants of land. When peace was restored in 1783 Greene returned to Rhode Island, where he received numerous testimonials of the public admiration. In 1785 he retired with his family to his estate in Georgia, where he died of sun-stroke in 1786.

Greene was one of the very best generals of the war of independence, second, perhaps, only to Washington, whose intimate friend he was.

GREENE, NATHANIEL, b. N. H., 1797; was apprentice in the office of the *New Hampshire Patriot*, and at the age of 17 edited the *New Hampshire Gazette;* afterwards the *Gazette* at Haverhill, N. H., and the *Essex Patriot.* In 1821 he started the *Boston Statesman*, a prominent democratic organ. He has published *Tales and Sketches from the German and French*, and *Improvisations and Translations.*

GREENE, ROBERT, an English poet and dramatist, was b. at Norwich about 1560, or, as stated by some of his biographers, in 1550. He was placed at St. John's college, Cambridge, and took out his degree of A.B. there in 1578. He afterwards traveled in Spain and Italy. On his return, he re-entered the university, and took his degree of A.M. at Clare Hall in 1583. He also appears to have studied at Oxford in 1588. On leaving Cambridge, he proceeded to London, where he supported himself by writing plays and romances. He poured out plays, poems, and novels, ruffled about in silks, wore long hair, and haunted taverns and places of questionable resort with such wild and profane geniuses as Marlowe and Peele. He died of the consequences of a debauch, Sept. 3, 1592, and was buried next day in the New church-yard, near Bedlam. After his death appeared the singular pamphlet entitled *The Repentance of Robert Greene, Master of Arts*, in which he lays bare the wickedness of his former life. It is perhaps the most valuable of his prose writings. Greene's poems possess considerable grace and tenderness, but his plays have almost perished from human memory. His *Groat's Worth of Wit bought with a Million of Repentance* contains one of the few authentic contemporary allusions to Shakespeare; and when his writings are forgotten, he will be remembered for it, and for being one of the knot of young men who came up to London when the English drama was creating itself, and who burned themselves out in fierce labor and fiercer dissipation. See Dyce's ed. of Greene (1861).

GREENE, S. DANA, b. Md., 1840; graduated at the U. S. naval academy, and rose to the rank of commander in 1872. In the battle between the *Monitor* and the confederate iron clad *Merrimack* he succeeded to the command when capt. Worden was wounded, and drove the *Merrimack* into Norfolk harbor.

GREEN EARTH, a mineral of a green color and earthy character, often found filling the cavities of amygdaloid, or incrusting agates in that rock, sometimes also massive or disseminated, chiefly in trap rocks. It consists principally of silica, alumina, and protoxide of iron, the silica constituting about one-half. It is used as a pigment by painters in water-colors, who know it by the name of *Mountain Green.* For their use, it is mostly brought from Monte Boldo, near Verona, and from Cyprus. In New Jersey, green earth is used as a manure, and is said to be very beneficial.

GREEN EBONY, a dyewood imported in considerable quantities into Britain from South America. It is the wood of the *jacaranda ovalifolia*, a tree of the natural order *bignoniaceæ*. It yields olive-green, brown, and yellow colors. It is generally imported in pieces about 3 ft. in length; it is a hard wood of an olive-green color, and is sometimes used for purposes of carpentry and by turners. The tree has showy, panicled flowers.

GREENFIELD, a t. in Franklin co., Mass., near the Connecticut river, about 2 m. above the junction of the Deerfield, on the Connecticut river, and the Vermont and Massachusetts railroads; pop '80 (with township), 3,903. The Green and Fall rivers afford ample water-power, and there are several important manufactories, particularly of fine cutlery. In the village are a court-house, several churches, and many excellent schools.

GREENFINCH, *Coccothraustes chloris*, a bird of the family *fringillidæ*, common in most parts of Britain, frequenting gardens, orchards, shrubberies, small plantations, tall hedges, and cultivated lands. It is found even in Scandinavia, but is more common in the s. of Europe; its range extends throughout Asia to the Pacific ocean, and westward as far as Madeira. It is sometimes called *green grosbeak* and *green linnet* (Scot. *green lintie*). The bill is much thicker than that of the true linnets, to which, however, it is nearly allied. A prevailing green tint, mingling with gray and brown, characterizes the plumage, and gives the bird its name. The whole length is little more than six inches. The tail is a little forked. The proper song of the Greenfinch is not very sweet, but in confinement it readily imitates the song of other birds, and in consequence of this and of its very easy domestication, it is rather a favorite cage-bird.

GREENGAGE, a variety of plum, of a green color and roundish shape, the *Reine Claude* of the French, generally esteemed as one of the finest varieties in cultivation, if not certainly superior to all others. It is not of the largest size, but in delicacy and richness of flavor it is unsurpassed.

GREENHEART, or BEBEERU, *Nectandra Rodiæi*, a tree of the natural order *lauraceæ*, a native of Guiana, of great value as a timber-tree, and also yielding a valuable medicinal bark. The timber is commonly called *greenheart;* the bark is better known as *bebeeru* (otherwise *beebeeru*, *bibiru*, *bibiri*, etc., and *sipiri* or *sipeira*), and the alkaloid to which it chiefly owes its properties is called *bebeerine* (q. v.). The tree grows chiefly in British Guiana, and in the greatest perfection on the low hills immediately behind the alluvial lands; it rises with an erect, slightly tapering trunk to a height of 40 or 50 ft. without a branch, attaining a height of 80 or 90 ft. in all, and a diameter of 3 or even 4 feet. The wood is extremely strong and hard, and is imported into Britain, to be used chiefly by turners for the same purposes as lignum vitæ, which it much resembles. It takes a high polish. It is so heavy as to sink in water. It is remarkable for its durability, and for being almost exempt from the attacks of the white ants on land, and of the teredo in water. It is used in Guiana for ship-building, and for all the most important purposes for which timber is required.—The bark is hard, heavy, and brittle, with a fracture resembling that of sandstone, has a white epidermis, and is of a bright cinnamon color within. It has a very bitter, somewhat astringent taste. Its tonic and febrifugal properties resemble those of cinchona bark. Instead of the bark itself, the sulphate of bebeerine is generally used in medicine.

South America produces a number of species of *nectandra*. *N. puchury* yields the seeds called *pitchurim beans*, which are astringent, are regarded as febrifugal, and are prescribed in dysentery, diarrhea, etc., and the oil of which is used as a substitute for chocolate.

GREEN-HOUSE, a building appropriated to the cultivation of such exotic plants as do not require much artificial heat, but cannot endure the open air, at least in the colder part of the year. The name is derived from the original use of such buildings for the preservation of oranges, myrtles, and other evergreens; the cultivation of heaths, pelargoniums, fuchsias, and the many other flowers now familiar to everybody, not having been then introduced. The first green-house of which there is any record was erected about 1619, by Solomon De Caus, at Heidelberg, to shelter orange-trees. The Chinese, however, are not unacquainted with green-houses, and it is not known how long this has been the case. The earlier green-houses were glazed only on the sides; glass roofs were introduced in the beginning of the 18th c., and the arched or curvilinear glass roof, still more favorable to the proper admission of the sun's rays, is an improvement which dates from the early part of the 19th. Heat was at first supplied, when necessary, by hot embers put in a hole in the floor, afterwards by furnaces in the green-house; flues, steam, and hot-water pipes, etc., are more recent inventions. See HOTHOUSE. As a green-house does not require artificial heat during summer, the roof is sometimes made capable of being then removed; more generally, many of the plants are carried out into the open garden. Air is freely admitted into the green-house in fine weather, even in winter, during the warmest part of the day, care being taken that the plants are not exposed to frost, nor to ungenial and chilling winds. Green-houses are sometimes appropriated chiefly to particular genera of plants, under such names as *heathery*, *camellia-house*, etc. According to the present use of the term, a green-house differs from a

conservatory only in the plants being in pots, which are very generally placed on the shelves of *stages*, having a slope not very different from that of the roof.

GREEN ISLAND, a village in Albany co., N. Y., on an island in the Hudson opposite Troy; pop. about 5,000. It connects with both shores by bridges, and has important manufactories for railway cars and machinery, foundries, and a large trade in lumber.

GREEN LAKE, a co. in central Wisconsin, on Fox, Grand, and White rivers, reached by the Milwaukee and St. Paul, and the Sheboygan and Fond-du-Lac railroads; 370 sq.m.; pop. '75, 15,274. The surface is undulating and to a large extent covered with forests. Wheat, corn, oats, hay, and butter are the chief products. Co. seat, Dathford.

GREENLAND, a region of unknown extent northwards, stretches from its southern extremity, cape Farewell (q.v.), along the Atlantic and Arctic oceans on the e., and Davis' strait, Baffin's bay, and Smith's sound on the west. The w. coast pursues a n.n.w. direction as far as cape Alexander, in 78° 10′ n. lat. It then has a general north-easterly direction, gradually changing to easterly beyond 82° 30′. Lieut. Beaumont, of the British Arctic expedition of 1875–76, followed the line of the coast with a sledge-party to 82° 54′ n. lat., and 48° 33′ w. long., when the land was beginning to trend southward. It is thus almost conclusively proved that Greenland is entirely distinct from the land on the w. side of Smith's sound—that in fact Greenland is an island. Previously our knowledge of the western coast was chiefly derived from Dr. Kane, who had assigned cape Alexander, in about lat. 78° 10′ n., as its termination. Greenland is said to have been first discovered about the close of the 9th c. by an Icelander named Gunbiörn, who named it Hvidsaerk (White Shirt), from its snowy headlands. It first obtained the name Greenland from another Icelander, Eric Rauöi (the Red), who led hither an expedition in 985 or 986, and founded two settlements on the w. coast, called the Oestre and Westre Bygd (the e. and w. colonies). About four centuries afterwards, the Westre Bygd was destroyed by the pestilence called the "black death," combined with the attacks of the aborigines; and a century after this, the Oestre Bygd suffered the same fate. Greenland was visited, and its w. coast explored, successively by Frobisher, Davis, and Baffin, the latter having advanced as far as lat. 78° n. (the limit of the inhabited country). In our own times Dr. Kane has extended his explorations as far as lat. 82° 30′, or within 520 m. of the north pole. The eastern and southern coasts appear to be so beset with ice as to be practically inaccessible. The former was explored by Dr. Scoresby as far as lat. 74° 30′ n., and two inlets, Scoresby's sound and Davy's sound, were discovered running far into the interior. This coast-land is called by the inhabitants of the other districts Lost Greenland. Owing to the great extent of land towards the pole, the climate of Greenland is colder than that of corresponding latitudes further e.—so much so, that in Lapland, lat. 72° n., the temperature is as high as in Greenland, lat. 60° north. From observations made by Dr. Kane between Sept., 1853, and April, 1855, in lat. 78° 37′ n., long. 70° 40′ w., the average temperature throughout the year is — 3.22°; from Oct. to April inclusive, — 23.43°; from May to Sept. inclusive, + 25.07°. The greatest degree of cold was — 68° in Feb., and the greatest heat was + 53.9° in July, the only month in which the average temperature was above the freezing-point. During the short summer, which in few places exceeds four months (during two of which, June and July, the sun is always above the horizon), vegetation is very rapid, the plants being for the most part the same as those indigenous to the n. of Scotland, but of a more dwarfish character, the tallest trees not exceeding 18 feet. The inclemency of these regions does not affect the animal kingdom (man excepted). The walrus, seal, polar bear, arctic fox, dog, and reindeer abound, and supply the inhabitants with almost all the necessaries of life. Black cattle and sheep have been introduced by the missionaries. The sea swarms with different species of cetacea, such as the rorqual, mysticetus, narwhal, porpoise, etc., and of fish, as the cod, salmon, and herring. Sea-fowl are also very abundant during the summer season, while guillemots, sandpipers, plovers, and grouse are also found. The only mineral which has been found in sufficient quantity for exportation is cryolite (q.v.), which is found at Arksut, and is largely exported. Near the same locality are found veins of tin associated with ores of lead, copper, zinc, iron, molybdenum, and with cryolite, fluor-spar, zircon, and other minerals. Copper-ore is said to be abundant in various parts, and gadolinite, sodalite, tourmaline, along with garnets, iolite, rock-crystal, etc., are often found. Good coal is found in abundance on the island of Disco.

There are now 13 different Danish colonies along the w. coast of Greenland—7 in north Greenland (n. of lat. 67° n.), and 6 in south Greenland, with a pop. of about 10,000, inclusive of from 200 to 300 Danes. The first settlement was made in 1721, by Hans Egede (q.v.) a Norwegian clergyman at Godthaab, who, with 43 colonists, planted a missionary station in this bleak region. This mission is supported by the Danish government. It now possesses 8 missionary stations, and the Moravians 5; from Julianehaab, the most southern, to Upernavik, at the very verge of human existence. In May, 1874, the first native pastor was ordained. The population depends chiefly on the fisheries—the same which have so long attracted so many vessels from Great Britain. The exports are whale and seal oil, and cryolite; the skins of the seal, reindeer, and

fox; and eider-down. The imports are wheat, brandy, coffee, sugar, tobacco, and firewood. About 10,000 or 12,000 tons of cryolite are annually exported, half going to Denmark and half to the United States. The trade to Greenland has always been a monopoly in the hands of the Danish government. Each settlement is managed by a trader and his assistant, who are paid by government. The whale-fisheries, which are carried on by the settlers, are also for the behoof of the Danish crown.

GREENLEAF, BENJAMIN, 1786–1864; b. Mass.; graduated at Dartmouth, and became principal of Bradford academy and of the teachers' seminary at the same place. He was a member of the legislature in 1837–9. He is best known through his text books on arithmetic, algebra, and surveying.

GREENLEAF, SIMON, 1783–1853; b. Mass.; graduated at Harvard; was admitted to the bar in 1806, and became distinguished as an advocate and jurist. When Maine was separated from Massachusetts he was made reporter of the supreme court of the new state, and 9 vols. of his reports were published. In 1833 he became professor of law in Harvard, and resigned in 1848. Among his works are *Origin and Principles of Freemasonry; Examination of the Testimony of the Four Evangelists by the Rules of Evidence as Administered in Courts of Justice, with an Account of the Trial of Jesus; Treatise on the Law of Evidence;* and *Overruled, Denied, and Doubted Decisions and Dicta.*

GREEN MOUNTAINS, a portion of the Appalachian range. See APPALACHIANS.

GREEN MOUNTAINS (*ante*), the n. extension of the great Appalachian system, covering a large portion of Vermont. Reaching the state near the s.w. corner they form almost an unbroken line through the w. section in the direction e.n.e. They form a continous water-shed, streams from the w. slope going into lake Champlain and those from the e. side into Connecticut river. The Lamoille, Missisquoi, and Winooski rivers make their way through the range and reach the lake. The more important of the peaks and their height above tide are: Mansfield, 4,279 ft.; Camel's Hump, 4,188; Killington, 3,984; and Ascutney, 3,320. The ascent of Killington peak is not difficult, and from the top there is a magnificent view. The mountain is 9 m. from Rutland.

GREE'NOCK, a parliamentary burgh, market-town, and important seaport of Scotland, in the co. of Renfrew, is situated on the southern bank of the Firth of Clyde, on a narrow strip of shore, and on the slopes of the hills which form its background, 22 m. w.n.w. of Glasgow. It extends upwards of 2 m. along the shore, and at one place it climbs to a considerable elevation up the face of the hills, which here rapidly attain an elevation of 800 ft.; while toward the w., and all over the front of the hills, new and elegant villas are continually being erected. From the rising grounds behind the town, and from the western shore, the view of the opposite coasts of Argyle and Dumbarton shires, fringed with white gleaming villages and of the firth stretching away into narrow lochs, and dotted over, especially in summer, with every variety of craft, is exceedingly picturesque and beautiful. The most important buildings are the custom-house, the exchange, the Watt monument containing a statue of Watt by Chantrey, a museum, a lecture-room, and a library, the mechanics' institute, etc. The harbors of Greenock have been constructed upon a large scale—the Albert in 1866; and from it extends westward the fine Princes pier, opened in 1370. Its quays can be approached by steamers, and its harbors entered by vessels at any state of the tide. The commerce of the town is chiefly with North America, and the West and East Indies. The trade is mainly in sugar-refining, for which it has 15 establishments, turning out refined sugars to the value of upwards of £4,500,000 annually. In ship-building, about 20 iron vessels are turned off the stocks annually. There are, besides, manufactures of steam-engines, chain-cables, anchors; and rope and sail making. Greenock has almost constant intercourse with Glasgow by river or railway, and is the general starting-point for tourists *en route* for the western Highlands and isles. It sends one member to parliament. The number and tonnage of vessels which entered and cleared at the port of Greenock for the following two years are returned as follows: In 1871, 3,246 vessels, of 738,231, tons, entered and cleared the port; in 1875, 7,134 vessels, of 1,706,547 tons. The sugar imported in 1830 was 18,357 tons; in 1840, 22,872 tons; in 1850, 45,815 tons; in 1860, 74,289 tons; in 1871, it was 213,090 tons; in 1877, 236,699 tons. The globe sugar-refining company turns out 720 tons a week. The value of foreign and colonial merchandise imported in 1876 was £5,278,155. Pop. '71, 57,821.

Originally consisting of only a few thatched houses, Greenock was created a burgh of barony in 1635 (having then a population of less than 2,000), and a parliamentary burgh after the passing of the reform act in 1832. The prosperity of the town dates from the union in 1707, when free commerce to America and the West Indies was opened up.

GREENOUGH, HORATIO, 1805–52; b. Boston; a self-taught sculptor, befriended by Washington Allston. He was in Italy in 1825; returned in 1826, made some creditable work, and again went to Italy, fixing upon Florence as his abode. Here he worked with great assiduity, producing a vast number of pieces, of which a few are a statue of "Abel;" Byron's "Medora;" "Genius of America;" a statue of "Washington;" the "Angel Abdiel;" the "Graces;" "Savior Crucified;" and busts of John and John Quincy Adams, Henry Clay, Josiah Quincy, Samuel Appleton, Jonathan Mason,

Thomas Colen, John Jacob Astor, John Marshall, and others. The large group of "The Rescue" in the capitol took eight years of his time. It had been brought by him from Italy, and he was preparing to set it in its place, when he died suddenly of brain fever. He was the author of several essays on esthetics, and was perhaps more eminent as a critic of art than as an artist. His work has doubtless been surpassed by that of later sculptors, but he may fairly be called the father of American sculpture.

GREENOUGH, RICHARD S., brother of Horatio, and also a sculptor, b. Mass., 1819. He had the advantage of study under Clevinger, and in 1840–41, was among the artists and galleries of Europe. Some of his works are a "Head of Christ;" "Moses and Pharaoh's Daughter;" "Night Watching a Young Mother;" "Cupid Warming an Icicle;" "The Shepherd Boy and the Eagle;" "Victory;" with various busts and ideal heads.

GREENPOINT. See BROOKLYN.

GREENPORT, a t. in Suffolk co., N. Y., on the n. shore and near the e. end of Long Island, at the terminus of the Long Island railroad, 95 m. e.n.e. of New York. It is a port of entry and was once the starting point of an important whale-fishing business. There is still considerable local business and trade by sea. The town and neighborhood are much frequented by summer pleasure-seekers.

GREEN RIVER, a river of North America, and tributary of the Ohio, rises near the center of the state of Kentucky, and flows through it; first in a westward direction for about 150 m., passing the Mammoth cave, then north-westward for the remainder of its course. It joins the Ohio 9 m. above Evansville, in Indiana, and at its mouth is about 600 ft. in breadth. It is upwards of 300 m. in length, and is navigable for small steamers for 200 miles. The lower course of the Green river abounds in coal.

GREEN RIVER, the name of two considerable streams in Massachusetts; one comes from Windham co., Vt., and falls into Deerfield river at Greenfield. The other, starting from the boundaries of Massachusetts and New York, runs s. through West Stockbridge, Alford, Great Barrington, etc., to the Housatonic. Both streams afford valuable water-power.

GREEN RIVER, rising in Wyoming, flows s. through about two thirds of Utah; unites with Grand river and forms the great Colorado. The Green is 750 to 800 m. long, and runs through many deep gorges and cañons in a mountainous region, and is for the most part too rough or shallow for navigation.

GREENS, the common name of all those varieties of kale or cabbage (*brassica oleracea*) which do not boll, and of which the leaves are used for the table as boiled vegetables; some of which are also called colewort, etc., whilst others, particularly those with curled leaves, as German greens, have no other name than greens or kale. Young unbolled cabbages, and shoots from the stocks of cabbages, are often also called greens, as well as turnip-tops, and other leaves of plants used in the same manner.—The leaves of GERMAN GREENS are very much waved or curled. It is one of the best kinds of *open* greens. It is either sown in spring, and planted out soon after; or it is sown in autumn, and planted out in spring.

GREEN'SAND, the name given to two divisions of the cretaceous measures (q.v.). They are so called from the occurrence in some of their beds of numerous small green specks of silicate of iron, sometimes so abundant as to give a green color to them. The term is, however, far from being descriptive of the various included strata; it must be considered simply as a name. In some districts, especially on the continent, the green particles are entirely absent from the strata. On this account it has been proposed that the lower greensand should be called Neocomian, because strata of this period are well-developed at Neufchâtel (Neocomum), in Switzerland. The mineral structure or lithological character of the upper greensand is so like that of the lower, that it is scarcely possible to separate them when the intermediate gault is absent, except by their organic remains, which are very distinct; so much so, indeed, as to have caused the placing of the one series in the lower cretaceous group, and the other in the upper. It should also be noticed that the relative importance of the two divisions is very different; the lower greensand includes a series of strata that are of a value nearly equal to the whole upper cretaceous group, of which the upper greensand is but a subordinate member.

The *upper greensand* consists of beds of sand, generally of a green color, with beds and concretionary masses of calcareous grit, called firestone. The strata on the cliffs of the isle of Wight are 100 ft. in thickness. This formation is supposed to have been a littoral deposit on the shore of the cretaceous seas. While the chalk was being deposited out at sea, these sands were being laid down along the shore, contemporaneous with the chalk, although they appear inferior to it. Their position would necessarily result from the cretaceous sea widening its area, and as the shore submerged, the greensand would be covered with the chalk, and would appear as an older and underlying deposit. The beds of this period are rich in fossils, abounding especially in the remains of sponges, mollusca, and echinodermata.

The *lower greensand* consists of a large series of more or less indurated sandstones and clays, with occasional calcareous beds. They attain a thickness of 850 feet. The sands preponderate in the upper, and the clays in the lower portion of the formation.

Some beds of clay of considerable thickness, sometimes as much as 60 ft., are used as fullers' earth. The calcareous stone is a highly fossiliferous band of limestone, locally called Kentish rag, much used for building in Kent and Sussex. The formation was formerly known as the iron sand, because of the sands being cemented together by an abundance of oxide of iron; this gives them a reddish color. The lower greensand contains numerous fossil mollusca and other marine remains. It is a sea deposit resting on the fresh-water wealden strata, and showing that at this period the sea made considerable encroachments on the dry land.

GREENSBORO, the seat of justice of Hale co., Ala., on the Selma, Marion, and Memphis railroad, 5 m. n.w. of Selma: pop. '70, 1760. The village is the seat of the Southern university of the M. E. church (founded in 1859), and has a female seminary and other schools.

GREENSBURG, the seat of justice of Decatur co., Ind., on the Indianapolis, Cincinnati, and Lafayette railroad, 68 m. w.n.w. of Cincinnati; population estimated at 3,700. The place has a considerable number of manufactories, a court-house, and high school.

GREENSHANK, *Totanus glottis*, a bird of the same genus with the redshank and some of those known as sandpipers, but differing from them in the stronger and slightly recurved bill. It is about the size of a woodcock, but has much longer legs. The bill is about 2 in. long. The tail is short. The lower part of the tibiæ is naked. The plumage is mostly dusky brown on the upper parts, the feathers edged with yellowish white; the under parts are white. Small flocks of this bird are seen on the British coasts in the winter months, and sometimes near inland lakes and marshes. A few remain to breed in the Hebrides and n. of Scotland, but the greater number repair to more northern regions. The geographic distribution of the species is extremely wide even for a bird of passage; from the arctic parts of Europe, Asia, and America, it extends southward as far as Java and Jamaica.

GREEN SNAKE, a serpent common through most of the United States, especially in grassy places; long, slender, and entirely harmless.

GREENSTONE, a variety of trap rock (q.v.), composed of feldspar and hornblende, and having generally a greenish color, hence its name. It has a more or less compact structure—the component crystals in one specimen being scarcely discernible with a pocket-lens, while in another they form a coarse aggregate, and specimens exhibiting all the intermediate stages may be found. In the finest they are not so small and compact as in basalt. Its crystalline structure separates greenstone equally from the earthy tufts and the glassy pitchstones. It may become porphyritic from a portion of the feldspar forming into larger distinct crystals. In weathering, the disintegrating greenstone assumes a dark-brown color, and exfoliates round limited centers, giving the rock an appearance as if it were composed of a number of large bowlders.

GREENUP, a co. in n.e. Kentucky, on the Ohio river, crossed by the Eastern Kentucky railroad; 480 sq.m.; pop. '70, 11,463—461 colored. The surface is hilly. Chief productions, corn, wheat, and oats. Co. seat, Greenup.

GREENVILLE, a co. in n. South Carolina, on the North Carolina border, n.e. of Saluda river, intersected by the Atlantic and Richmond railroad; 800 sq.m.; pop. '80, 37,494—14,511 colored. The surface is diversified by mountains, hills, and valleys, and much of it is yet forest land. Wheat, corn, and pork are the main products. Co. seat, Greenville Court House.

GREENVILLE, a co. in s.e. Virginia on the North Carolina border s. of Nottaway river; crossed by the Petersburg and Weldon railroad; 300 sq.m.; pop. '70, 6,362—4,207 colored. The surface is level and largely covered with forests. Corn, oats, and tobacco are the main products. Co. seat, Hicksford.

GREENVILLE, the seat of justice of Butler co., Ala., on the Mobile and Montgomery railroad, 34 m. n.n.e. of Mobile; pop. '70, 2,856. The village has a court-house, several churches, and some manufactures.

GREENVILLE, the seat of justice of Darke co., Ohio, on the Dayton and Union railroad at the junction of the Columbus, Chicago and Indiana Central, 94 m. w. of Columbus; pop. 2,520.

GREENVILLE, or GREENVILLE COURT-HOUSE, the seat of justice of Greenville co., S. C., on the Atlanta and Richmond, at the terminus of the Greenville and Columbia railroad; pop. '80, 6,159. It is pleasantly situated, and is the seat of the southern Baptist theological seminary, and of the Farman university, also Baptist. There are some manufactories.

GREEN VITRIOL, a popular name for sulphate of iron. It sometimes occurs as an efflorescence resulting from a chemical change in *iron pyrites* or sulphuret of iron, but its quantity is generally small. It crystallizes in acute oblique rhombic prisms.

GREENWEED, a name given to certain half-shrubby species of *genista*. See GENISTA and BROOM.—DYERS' G. (*G. tinctoria*), a species about one or two feet high, with lanceolate leaves, and terminal spiked racemes of pale-yellow flowers, is frequent in woods,

meadows, and hilly pastures in most parts of Europe, and in the temperate parts of Asia; and is common in many parts of England, but rare in Scotland and Ireland. Its branches, leaves, and flowers—particularly the flowers—yield a fine yellow dye, chiefly used for wool; its flowers mixed with woad yield a fine green dye. It was formerly in great esteem as a dye-stuff, but others have now almost entirely supplanted it. The leaves and seeds were also formerly used in medicine; the former as a diuretic, the latter as a mild purgative.—HAIRY G. (*G. pilosa*), a rare native of Britain, but abundant in some parts of Europe, is cultivated in some places, especially in France, as food for sheep, which are very fond of it. It is particularly adapted for light and sandy soils. It is a slender, branched, tortuous, and procumbent plant, with small pale-yellow flowers.

GREENWICH, a t. in Fairfield co., Conn., on Long Island sound, and the New York and New Haven railroad, 30 m. n.e. of New York, near the boundary of New York state. It is a handsome village and a favorite place of residence for business men of the metropolis. The place was settled about 1640, and ten years later was agreed upon by a Dutch and English commission as the w. boundary of Connecticut. The present village is on a rolling hill half a mile from the railway station. A short walk to the e. brings one to a stately Congregational church built of gray marble with high pointed roof and a fine stone spire visible for many miles along the sound. A few yards to the e., where a church stood in 1779, gen. Putnam with 60 raw militiamen fought to the last moment a large force of English dragoons, and then galloped his horse down a declivity where no enemy dared to follow. Most of his men escaped by hiding in a swamp.

GREENWICH, a parliamentary borough of England, in the co. of Kent, is situated on the right bank of the Thames, at a distance of 5 m. s.e. of London. It stands partly on an acclivity, but for the most part on low marshy ground, portions of which are said to be below the level of the Thames. The older streets are in general narrow and irregular, but those more recently built are spacious and handsome. By far the most interesting institution in Greenwich is the hospital. See GREENWICH HOSPITAL. Among the other more important buildings are the Norfolk college, which supports 22 poor inmates and a warden, and of which the Mercers' company are the trustees; and the royal observatory (see OBSERVATORIES), situated in the midst of Greenwich park, a finely-kept extent of public grounds comprising nearly 200 acres. Greenwich abounds in taverns, and is always a favorite resort of Londoners, but especially so in the "whitebait" season—from April to Aug. The town contains extensive engineering establishments, iron steamboat-yards, rope-works, and several factories. Greenwich, which is also connected with London by railway, is touched at by all the river steamers. Pop. '71, 169,361.

GREENWICH HOSPITAL, formerly a home for superannuated sailors, was a royal foundation, erected by the munificence of William and Mary, under their letters patent of 1694. For many generations a royal palace had occupied the site, and had always been a favorite resort of the sovereign. The buildings were sufficiently completed by 1705 (at a cost of £50,000) to admit 100 disabled seamen. By July 1, 1708, 350 had been admitted; and the income derived from bequests, the original royal grant, and from contributions made under coercion by sailors, amounted to £12,000 a year, half of which was expended in maintaining the seamen, and the remainder in completion of the building. In the reign of George II., the forfeited estates of the earl of Derwentwater, who had been attainted of high treason, were granted to the hospital, were granted to the hospital, and were computed at £6,000 a year. Up to 1834 a compulsory contribution of 6*d.* a month was exacted from all seamen, whether of the navy or merchant service, towards the funds of the hospital; but in that year an annual grant of £20,000 from the consolidated fund was substituted.

The income from all sources afterwards reached nearly £150,000 a year, out of which the following officers and pensioners were maintained: 1 governor, £1500 per annum; lieutenant-governor, £800; 4 captains, 4 commanders, 8 lieutenants, 2 masters, 2 chaplains, a considerable staff of naval medical officers and nurses, and 1600 pensioners. The pensioners were lodged, clothed, and fed at the expense of the hospital, and in addition had the following pecuniary allowance as tobacco and pocket-money: warrant-officers, 5*s.* a week; petty-officers, 4*s.*; seamen, 3*s.* The nurses were usually the widows of sailors who had lost their lives in the service.

The question had been frequently raised of late years, whether this superb charity was not, after all, a mistake, and whether the vast revenues would not be bestowed to better advantage in pensions to seamen, who might still find employment in aid of their subsistence, and who would have the happiness of passing the last days of their lives among their descendants and relatives. Under the old rules, the hospital was, so far as the pensioners were concerned, a monastery in which hundreds of men lived together, without any of the soul-sustaining inducements of monasticism. The old men were, on the whole, painful objects to contemplate, wrecks from whom no further good of any description was to be expected. Leading lives useless to themselves and to others, their best occupation was to recount, with the garrulity of age and the boastfulness of self-absorption, the exploits of long ago. Many would have preferred to see them in happy country-homes, kept by pensions from absolute want, teaching their grandchildren to

delight in the country's glory, and spreading throughout the land, instead of concentrating in one parish, a knowledge of how England can provide in their old age for those among her sons who serve her faithfully in their prime.

The authorities were convinced at last that this semi-monastic inclosed life was not good for the old salts, who much preferred being with their children and friends in country villages or at seaports. Accordingly, in 1865, by the 28 and 29 Vict. c. 89, the institution ceased to exist as an asylum for aged sailors. The funds were converted into *out*-pensions, providing for a larger number than were maintained in the hospital; the old men were relegated to their friends; and the truly noble buildings, after lying vacant for some five years, became a royal naval college for officers to acquire naval science.

Attached to the hospital is a school for the gratuitous education of 800 sons of seamen. This establishment is under the superintendence of the same commissioners as the hospital, and with regard to funds, is consolidated with it. The education given is such as to fit the recipients for service in the royal or merchant navy; and the period during which boys are permitted to participate in its advantages extends to from three to four years.

In addition to the in-pensioners alluded to above, about 12,000 old or disabled seamen were assisted in their old age by what was called the *Greenwich out-pension*. This, however, is now styled a *naval pension*. It varies from £3 to £57 a year. These men, distributed throughout the country, receive their pensions from the staff-officers of military pensioners, in their respective districts.

The buildings of Greenwich hospital and schools occupy the whole space, with the exception of a roadway, between the Thames and Greenwich park; and taken together, they constitute a magnificent series of buildings, those composing the hospital being among the finest in the whole kingdom.

GREENWICH OBSERVATORY. See OBSERVATORY.

GREENWOOD, a co. in s.e. Kansas, on the headwaters of Verdigris river; 1155 sq.m.; pop. '70, 3,484. The surface is generally level; productions agricultural. Co. seat, Eureka.

GREENWOOD, FRANCIS WILLIAM PITT, 1797–1843; b. Boston, graduated at Harvard, studied theology, and became prominent among those known as liberal Christians. For a year he was pastor of the new South church, Boston, but resigned in consequence of poor health. He was afterwards pastor of King's chapel. Among his literary labors were editing the *Unitarian Miscellany*, revising the *Book of Common Prayer*, *Sermons of Consolation*, *History of King's Chapel*, *Lives of the Twelve Apostles*, *Sermons to Children*, and many smaller publications.

GREENWOOD CEMETERY. See CEMETERIES.

GREER, a co. in the n.w. corner of Texas, according to the state claim, lying between the forks of the Red river; but considered by U. S. surveyors as lying within the Indian territory; area 3,480 sq. miles. It contains good land, but little timber. It is unsettled, and as yet unorganized.

GREG, WILLIAM RATHBONE, b. England 1809. In 1856 he was commissioner of customs. He has published *Essays on Political and Social Science; Enigmas of Life; Literary and Social Judgments; Political Problems; Creeds of Christendom; Rocks Ahead, or the Warnings of Cassandra; Mistaken Aims and Attainments of the Artisan Class*, and many short papers in the British journals. He is a trenchant writer, with a strong skeptical habit of thought.

GREGARINES (GREGARINIDÆ *ante*), animals which form the principal genus (*Gregarina*), of the family *gregarinidæ* of that branch of the animal kingdom called *protozoa*. The principal form is an oval sac without mouth or intestines, but filled with a granular matter. They are sometimes of considerable length, said to be owing to linear aggregation for purposes of reproduction. Whatever fructification is the result of this intercourse is cast forth by the bursting of the cell in the form of vesicles called pseudo-navicula, which, by the process of alternate generation, produce pseudo-amœbæ, these latter passing on into the condition of developed gregarines, to pass again through the different stages of the simple metamorphosis. One of the largest inhabits the intestines of the lobster, and is called *G. gigantea*, being nearly two-thirds of an inch long and nearly as wide. The gregarina infest the intestines of various articulates, as the lobster, crab, cockroach and various beetles. A small insect which infests the false hair which fashion often prescribes as a part of the head dress of women, has also been called a gregarine.

GREGARI'NIDÆ. This term was applied by Leon Dufour to designate a group of microscopic organisms belonging to the sub-kingdom *protozoa*, which have been discovered as parasites in the intestinal canal in various invertebrate animals, especially insects, araehnidans and certain chætopodous worms. They seem to have been first observed by Cavolini in the last century, but the earliest systematic notice of them is that of Dufour in 1828, who gave them their name from the groups in which they occurred.

The form of the body varies: it may be cylindrical, ovate, fusiform, or threadlike.

It is often marked by indentations or strictures corresponding to the spot where an internal septum divides the organism into two or more segments. In some, a process projects from one end of the body, or there may be two lateral processes, and to these prolongations minute hooks are attached by which it is supposed that these animals attach themselves to the surfaces on which they are generally found. Anatomically, the gregarinidæ consist of an extensible transparent membrane inclosing a granular mass, in which we observe a nucleus surrounded by a clear space. See CELLS. These organisms are colorless; their locomotive powers seem very limited; and they have neither mouth nor feet.

On carefully watching them under the microscope, we observe two of them to come in contact. The surfaces in contact become flattened, and a cyst or capsule soon forms around them and incloses them. Numerous globular vesicles are then produced in the interior, and these become ultimately metamorphosed into peculiar bodies, which are termed *pseudo-naviculæ*. The septum by which the two gregarinidæ were at first divided, finally disappears; the cysts bursts, and the pseudo-naviculæ escape, and in due time bursts also; and thus gives rise to bodies closely resembling amœbæ, minute animals belonging to the rhizopoda (q.v.), which at length develop themselves into young gregarinidæ. The coalescence or conjugation of the gregarinidæ is not positively essential to the formation of pseudo-naviculæ, since they are sometimes seen to occur within the bodies of single animals.

We have followed, as we believe, the best authorities in placing the gregarinidæ as adult forms of the group of the protozoa. There is, however, considerable difference of opinion regarding the position they ought to occupy. Stein places them among the infusoria, Leon Dufour, Leidig, Vogt, and others, place them under various divisions of the worms, while some have even held that they are vegetable forms.

It is exceedingly probable that certain minute parasitic organisms, occurring both on and within the bodies of fishes, and to which the term *psorospermiæ* has been applied, are identical with the pseudo-naviculæ, which we have already described.

The gregarinidæ have been divided into (1) the *monocystidæ*, when the animals are solitary; and (2) the *Zygocystidæ*, when two animals are conjoined.

Numerous memoirs have been written on the gregarinidæ. We may especially refer to Kölliker's memoir in the *Zeitsch. f. wissen. Zoologie* (1848), and the Lieberkühn's memoir on their development in the *Memoires Couronnés des Savants Etrang.*, published by the Brussels royal academy in 1855.

GREGG, a co. in n.e. Texas, on Sabine river, and the Texas and Pacific railroad; formed after the census of 1870. The surface is varied; chief productions corn and cotton. Co. seat, Longview.

GREGG, DAVID MCM., b. Penn., 1833; graduated at West Point, and served chiefly on the western borders. In the war of the rebellion he served on the union side, and was in a number of engagements. He resigned two months before the close of the war, holding the rank of brevet maj.gen. of volunteers.

GREGG, JOHN I., b. Penn., went into the army and served in the Mexican war. He served also in the war of the rebellion, and was engaged at Gettysburg, Cold Harbor, and other places. For good conduct he was made brevet brig.gen. in the regular army, and in 1866 was appointed col. of the 8th cavalry.

GREGOIRE, HENRI, the most remarkable among the so-called "constitutional" bishops of France, was born of poor parents at Vebo, near Luneville, Dec. 4, 1750. Having received his education from the Jesuits at Nancy, he entered into orders, and for some time held a professorship at the Jesuit college of Point-à-Mousson. A work of his, published in 1778, on the *Amelioration of the Condition of the Jews*, attracted considerable notice. It was translated into English, and crowned by the royal society of Metz. Gregoire, soon after his ordination, was appointed curé of Embermesnil, in Lorraine; and at the election for the states-general in 1789, he was chosen one of the deputies of the clergy. An ardent democrat in all his views, he attached himself from the first to the Tiers-état party, and acted a prominent part in the subsequent drama; he was one of the chief advisers of the secession, took the oath of the Tennis court with the rest, and supported the abbé Sieyes in the proposal for constituting the seceders into the national assembly, of which he became one of the secretaries. From that time forward, Gregoire pursued his course without hesitation. He was one of the most enthusiastic on occasion of the famous session of the night of Aug. 4, in the abolition and renunciation of the privileges of the nobles and clergy. Gregoire carried into every department the stern democracy to which he was devoted, and which he identified with the Christian brotherhood of the gospel. Upon the fundamental doctrine of the revolution—the "rights of man" he sought to ingraft his own early advocacy of the Jews and of the negroes. Carrying the same views into questions of church-polity, he was a zealous supporter of the civil constitution of the clergy. was the first of his order to take the oaths, and was elected the first "constitutional bishop" of the department of Loir-et-Cher. He was chosen for two places, but accepted this, although the old and legitimate bishop, Monseigneur de Themines, was still alive. When at the blasphemous feast of reason, the miserable Gobel, constitutional bishop of Paris, having publicly renounced Christianity, a similar renunciation was demanded from Gregoire by the infuriated

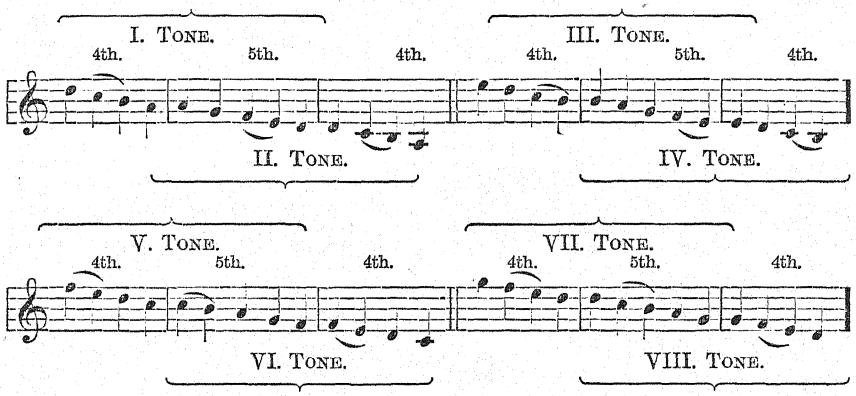
rabble, he firmly confronted the danger, and refused. Through the later phases of the revolution, under the directory, Gregoire continued to take a part in public affairs; and to his interference are due many of the measures connected with the public organization of literature and science, which still bear their fruits in the French system of administration. After the 18th Brumaire, he became a member of the corps legislatif. His extreme republicanism was highly distasteful to Bonaparte, and it was only after a third attempt that he was appointed member of the senate. On the conclusion of the concordat between Pius VII. and Bonaparte, he ceased to exercise ecclesiastical functions, as he could not be induced to give the retractations which the church authorities required. True to his old principles, he resisted every step towards the establishment of the absolute authority of Napoleon; and, in 1814, he was one of the first to pronounce against the empire. On the restoration, he was one of the most earnest in demanding from the king the acceptance of the constitution. During the "hundred days," he attracted no notice; but after the return of the king, he was excluded from the senate, and ceased thenceforth to hold any public place. During this enforced retirement, and in the intervals of leisure in his earlier political life, he published several works, literary, religious, political, historical, and polemical, the most voluminous of which are a *Chronique Religieuse*, in 6 volumes, and a *Histoire des Sectes Religieuses*, also in 6 volumes, but incomplete. When upon his death-bed, an effort was made by the archbishop of Paris to induce him to express his regret for the uncanonical and schismatical proceedings of his earlier career; but he persistently declined to make any retractation. In consequence of his refusal, the archbishop directed that the last rites of the church should be withheld. Notwithstanding this prohibition, the last sacraments were administered to Gregoire by the abbé Guillon, and he died May 23, 1831.

GREGORAS, NICEPHORAS, b. about 1295; a priest in Constantinople, who proposed a reformation in the calendar in a plan which came very near exactness. He was a theological controversialist, and was much involved in the disputes between the eastern and western branches of the church, and was in trouble about the teachings of Barlaam. He wrote a Byzantine history.

GREGO'RIAN CALENDAR AND YEAR. See CALENDAR.

GREGORIAN CHANT OR TONES, the name given to certain choral melodies introduced into the service of the early Christian church by pope Gregory the great, who flourished towards the end of the 6th century. The music of the church in earlier times was founded on the Greek system, as far as it could be used, which was improved from time to time, until St. Ambrose, bishop of Milan, in the 4th c. invented the Ambrosian chant. See AMBROSIAN CHANT. In 599 pope Gregory began to reform and improve the music of the church at Rome, by discarding the Greek tetrachord, or scale, on the basis of a fourth, and in its place substituting the scale of the octave, which some writers say he named by the letters of the alphabet, while others say he had a pecular set of signs called *nota Romana*, consisting partly of words with points, strokes, and other marks, which sufficiently served his purpose. To the authentic modes of Ambrosius, Gregory added the plagal, which began with the fourth below, and thus he completed the octave. He retained the four most useful modes of the Ambrosian chant, termed the *Dorian*, *Phrygian*, *Lydian*, and *Mixolydian*, which are supposed to have been obtained from the ancient Greeks. At first Gregory's improvement was called the *Roman chant*, but later it got the name of *cantum planum* or *firmum*, as it was originally sung in unison, and in notes all of the same length. At a later period the letters of the Roman, as well as of the Greek alphabet, were used to express the notes of the Gregorian chant, but without any general fixed order or rule. In the course of time, the system of notation on lines and spaces came into use; but at first only four lines were used, on which we find all the old examples of the Gregorian chant written. By the Gregorian tones, or modes (*toni*, *modi*) of Gregory, must be understood in certain melodious formula, made out of the union of a perfect fifth and a perfect fourth, or their inversion, to give the church-song greater variety. All the old writers agree as to the diatonic genus of the Gregorian tones, but they do not all agree as to the number of the tones; some counting fourteen, others twelve, while in some old Roman choral-books we find only eleven. The foundation of the system of the Gregorian tones may be explained thus: As there are seven notes from *a* to *g*, there should be at least seven different modes, or tone-systems, varying from each other according to the position of the semitones; but as the final or key-note of each mode might be the first note, or might be in the middle, the same scale could therefore, as it were, be viewed from two sides, which gave rise to the fourteen system of tones. It was, however, found that two of those were at variance with a fundamental rule of church-song—viz., that every mode or scale must possess a perfect fifth or perfect fourth; and that the modes containing a false fifth from *b* natural to *f* natural, or a false fourth from *f* to *b*, could not be used, and on account of the dissonant character of these intervals must be rejected. This reduced the number of tones to twelve. It was further found, that as four of the twelve were merely transpositions of some of the others, there were really only eight, and that they were in every respect sufficient for all the purposes of church-song. The eight Gregorian tones, as they are handed down to us, were in time fixed by a royal mandate of Charles the great—*octo*

toni sufficere videntur. The following example in modern notation in the G clef will show the position of the eight Gregorian tones:



There cannot be little doubt that pope Gregory greatly improved the church-music at the time, and that the eight tones have always been ascribed to him. That they are of great antiquity is certain, for we find them mentioned in a treatise on choral singing by one Aurelian in the 9th century. The different character of the Gregorian tones depends entirely on the places of the semitones, which in the above example are marked with a ⌒. Several of the tones have various endings, some as many as four, while the second, fifth, and sixth tones have each only one ending. For a full and interesting account of the Gregorian church-music, see N. A. Janssen's *Grundregeln des Gregorianschen Kirchengesanges*, published by Schott in Mainz, 1846.

GREGOROVIUS, Ferdinand, b. Prussia 1821; educated at Konigsberg, and devoted himself to poetry and history. He has published a learned review of Goethe's *Wihelm Meister; Death of Tiberius* (a tragedy), etc. After sojourning in Italy he published *Corsica; Life and Scenery in Italy; The Latin Summer*, and *Sicily*. His more important works are *History of Rome in the Middle Ages*, and *History of Lucretia Borgia*.

GREGORY, a co. in n. Dakotah bordering on Nebraska and bounded in part by the Missouri river, formed since the census of 1870; about 1150 sq. miles. Surface for the most part level.

GREGORY, the name of a Scotch family remarkably distinguished, like that of the Bernouillis, in the history of science. Its history goes back to the union in marriage of the rev. John Gregory, minister of Drumoak, Aberdeenshire, to a daughter of a David Anderson, who is described by Dr. Hutton in his *Philosophical and Mathematical Dictionary*, as "of Finzaugh, a gentleman who possessed a singular turn for mathematical and mechanical knowledge." The most distinguished offspring of this marriage was:

James Gregory, b. at Aberdeen in Nov., 1638 or 1639. He studied at Marischal college, after leaving which, he betook himself to optical science, in which he made his first discoveries. At the age of 24, he invented the reflecting-telescope known by his name, and which he described in a work, entitled *Optica Promota*. In 1664 or 1665, he went to London with a view to the construction of his telescope; but finding the artists he employed wanting in the skill necessary for grinding the metal for the object-speculum, he passed on to the university of Padua, where he devoted himself to study; and in the year 1667, produced his *Vera circuli et Hyperbolæ Quadratura*, followed, in 1668, by two other works, *Geometriæ Pars Universalis*, and *Exercitationes Geometricæ*. These works led him into correspondence with the greatest mathematicians of the age—Newton, Huyghens, Wallis, etc. He was immediately, on his return to London, elected a fellow of the royal society, and in 1669 he obtained the professorship of mathematics at St. Andrews, a chair which he filled for about six years. Here, in 1672, he produced *The Great and New Art of Weighing Vanity*, etc., which bore to be the work of M. Patrick Mathers, archbeadle to the university of St. Andrews, the object of which was to expose the ignorance of a prof. Sinclair of Glasgow, who had put a slight on one of the St. Andrews professors. In 1674 Gregory, who had in the meanwhile married Mary, daughter of Mr. George Jamieson, a distinguished painter, was called to Edinburgh to fill the mathematical chair, which he did for little more than a year. In Oct., 1675, when showing the satellites of Jupiter to some of his pupils, he was struck with total blindness,and a few days after died at the age of 36. For a particular list and account of his works and discoveries, see Hutton's *Philosophical and Mathematical Dictionary*. Dr. Hutton describes him as a man of very acute and penetrating genius, possessing an inventive mathematical genius of the first order; somewhat irritable in temper; but exhibiting one of the most amiable characters of a true philosopher—that of being content with his fortune.

By his marriage with Mary Jamieson, James Gregory had a son of the same name, JAMES GREGORY, M.D., born in 1674, who became professor of medicine in King's college, Aberdeen, where he founded the school of medicine. This James Gregory had two sons, JAMES GREGORY, M.D. (the second), who succeeded his father in the Aberdeen professorship; and JOHN GREGORY, M.D., who merits particular notice. He was born at Aberdeen in 1724, where he received his early education; afterwards he studied medicine at Edinburgh, Leyden, and Paris. After filling in succession the chairs of philosophy and medicine at Aberdeen, he was appointed, in 1766, professor of the practice of medicine in Edinburgh, where he long enjoyed high reputation as a teacher and practicing physician, along with the greatest personal popularity. He was the intimate friend of the most eminent men of Edinburgh in its most brilliant period. He died Feb. 9, 1773. Among his works are—*Elements of the Practice of Physic*, 1772; *A Comparative View of the State and Faculties of Man with those of the Animal World*, 1765; and *A Father's Legacy to his Daughters* (published after his death), 1793. In 1788 his works were collected in 4 vols. 12mo, by Mr. Tytler (lord Woodhouselee), who prefaced them by a life of the author. A life of him was also written by Mr. Smellie. His son, Dr. JAMES GREGORY (the third), became distinguished as professor of the practice of medicine at Edinburgh, and a leading man in his profession. He was the author of *Philosophical and Literary Essays*, 2 vols. 8vo, Edin. 1792. The son of this Dr. James was the late WILLIAM GREGORY, professor, at one time, of chemistry in King's college, Aberdeen, and who died April, 1858, as professor of chemistry in the university of Edinburgh. William Gregory was well known by his works on chemistry, and his edition of the inorganic part of Turner's *Elements of Chemistry;* the organic part of which was edited by Liebig. He also translated, 1855, Liebig's *Principles of Agricultural Chemistry.* Amongst his contributions to chemistry may be noticed his improved processes for the preparation of hydrochloric acid, muriate of morphia, and oxide of silver, and his memoirs on the preparation of sulphuric acid, on the preparation of creatine, on the decomposition products of uric acid, on the spontaneous decomposition of alloxan, on the purification of chloroform, etc.

We have now to revert to the original stock—the family of the rev. John Gregory and Jane Anderson. James Gregory, inventor of the telescope, and founder of the line of distinguished men which we have just followed, had an elder brother of the name of DAVID—a remarkable man, skilled in medicine, philosophy, and mathematics, and known as DAVID GREGORY of Kinardie—the first man in Scotland who kept a barometer, a circumstance which, according to Dr. Hutton, nearly led to his being tried by presbytery as a wizard. This David had three sons, named respectively, DAVID, JAMES, and CHARLES. The first of these became Savilian professor of astronomy, Oxford. He was born at Aberdeen in 1661, and there received the early part of his education, which was completed at Edinburgh. He is supposed to have been disposed to mathematical studies, by having been appointed literary executor of his uncle James—of the telescope—more likely it is that he was so appointed because he had already manifested an aptitude for such studies. With the executry, at any rate, his uncle's "mantle" descended upon him. In his 22d year he was appointed professor of mathematics in the university of Edinburgh, and by his lectures in this chair, he had the honor of being the first to introduce the Newtonian philosophy into the schools. In 1691, through the friendship of Newton and Flamsteed, he obtained the vacant Savilian professorship of astronomy at Oxford, for which the illustrious Halley was a competitor. Halley, however, soon after abtained the professorship of geometry in the same university, and became a great friend and fellow-worker of Gregory's. Dr. David died at Maidenhead in 1710, in his 49th year.

Among the works of Dr. David Gregory may be mentioned, *Exercitatio Geometrica de Dimensione Figurarum* (Edin. 1684); *Catoptricæ et Dioptricæ Sphæricæ Elementa* (Oxford, 1695), which contained the substance of his Edinburgh lectures, and in which, among other ingenious matters, Dr. Hutton thinks there is an anticipation of Dolland's achromatic telescope. *Astronomiæ Physicæ et Geometricæ Elementa*, Oxford, 1792. An edition of Euclid in Greek and Latin, which is highly valued, 1703. Towards the end of his life he worked with Dr. Halley on an edition of the *Conics of Apollonius*, but did not live to see it finished. He was the first who considered the Catenary, on which he left a paper in MS., besides a short treatise on the *Nature and Arithmetic of Logarithms;* a treatise on *Practical Geometry*, published in 1745 by Maclaurin; and many memoirs which were published in the *Phil. Trans.*, vols. xviii.—xxv. Of his four sons, the eldest, David Gregory, became regius professor of modern history at Oxford, and dean of Christ's church. On Dr. David Gregory removing to Oxford, he was succeeded, in 1691, in the Edinburgh chair, by his brother James, who filled it for 33 years, when he retired, and gave place, in 1725, to Maclaurin. His brother Charles, in 1707, became professor of mathematics at St. Andrews, an office which he held for 32 years, when he resigned it, and was succeeded by his son, another DAVID, who died 1763.—The three sons of David of Kinardie were thus, at the same time, professors of mathematics in three universities, while two of them left sons who obtained professorships. Dr. Thomas Reid of Glasgow, it may be mentioned, was a nephew, through his mother, of these illustrious brothers. Altogether, it is said (Chalmer's *Biographical Dictionary*, p. 289) that no less than 16 members of this family have held British professorships.—Mention

must be made, in conclusion, of R. F. GREGORY, late fellow of Trinity college, Cambridge, author of *Examples in Differential and Integral Calculus*, and other valuable works, who died before bearing the full fruits of his genius, and who is understood to have belonged to the family of the Scottish Gregories.

GREGORY, the name of sixteen popes, of whom the most important, historically, are treated in separate articles.

GREGORY I., THE GREAT, a father and saint of the Roman Catholic church, was born in Rome about the middle of the 6th c. of an illustrious Roman family. His father, Gordianus, was a senator, and one of the earlier pontiffs; Felix III. had belonged to the same family. At a comparatively early age Gregory was named by the emperor Justin II. to the important charge of prætor of Rome; but he voluntarily relinquished this office, and withdrew altogether from the world into the monastery which he had founded in Rome, under the title of St. Andrew's. This was but one of many such acts of religious munificence. "He founded and endowed," says Dean Milman, "six monasteries in Sicily." Before entering the Roman convent, equally founded by himself, which he chose for his own retreat, "he lavished on the poor all his costly robes, his silk, his gold, his jewels, his furniture, and not even assuming to himself the abbacy of his convent, but beginning with the lowest monastic duties, he devoted himself altogether to God." This was probably about 575. He was elected abbot of his monastery, and it was while he was still in this office that the well-known incident befell of his meeting the Anglo-Saxon youths in the slave-market, and on being struck by their beauty, and learning that they came from a pagan land, resolving to devote himself to the conversion of that land to Christianity. He set forth on his journey, but the clamor of the Romans at his loss led the pope Benedict to compel his return, and eventually to enroll him in the secular ministry by ordaining him one of the seven regionary deacons of Rome. Benedict's successor, Pelagius II., sent Gregory as nuncio to Constantinople, to implore the emperor's aid against the Lombards. He resided three years in Constantinople, during which time he commenced, and perhaps completed, his great work, the *Exposition of Job*. On his return to Rome he resumed his place as abbot, and on the death of Pelagius, in a plague which laid waste the city, Gregory was unanimously called by the clergy, the senate, and the people to succeed him. He used every means even to a petition to the emperor Maurice to withhold his consent, to evade the dignity; but he was forced to yield, and was consecrated Sept. 3, 590. Few pontiffs have equaled, hardly one has surpassed, Gregory as the administrator of the multiplied concerns of the vast charge thus assigned to him. "Nothing," says Dean Milman, "seems too great, nothing too insignificant for his earnest personal solicitude; from the most minute point in the ritual, or regulations about the papal farms in Sicily, he passes to the conversion of Britain, the extirpation of simony among the clergy of Gaul, negotiations with the armed conquerors of Italy, the revolutions of the eastern empire, the title of universal bishop usurped by John of Constantinople" (*Latin Christianity*, i. 439). There is no department of ecclesiastical administration in which he has not left marks of his energy and his greatness. To him the Roman church is indebted for the complete and consistent organization of her public services and the details of her ritual, for the regulation and systematization of her sacred chants. The mission to England, which he was not permitted to undertake in person, was intrusted by him, with all the zeal of a personal obligation, to Augustine; and, under his auspices, Britain was brought within the pale of Christian Europe. Under him the Gothic kingdom of Spain, long Arian, was united to the church. Nor was his zeal for the reformation of the clergy, and in purifying of the morality of the church, inferior to his ardor for its diffusion. His letters, which are numerous and most interesting, are full of evidences of the universality of his vigilance. On occasion of the threatened invasion of Rome by the Lombards, Gregory is declared by Milman to have "exercised the real power by performing the protecting part of a sovereign;" and in his general administration, to have been "in act and in influence, if not as yet in avowed authority, a temporal sovereign." Against the memory of his administration of Rome a charge was formerly made, that in his zeal against paganism he destroyed the ancient temples and other buildings of the pagan city; but Gibbon confesses that the evidence "is recent and uncertain;" and, indeed, the only authority to which Gibbon himself refers, Platina, simply mentions the charge in order to repudiate it. The same, according to Milman, may be said of "the fable of his having burned the Palatine library in his hatred of pagan literature, which is now rejected." As regards the general government of the church, Gregory reprobates very strongly the assumption by John, patriarch of Constantinople, of the title of ecumenical or universal bishop; the more especially, as the object of John in assuming this title was to justify an exercise of jurisdiction outside of the limits of his own patriarchate. In his writings, too, the details of the whole dogmatical system of the modern church are very fully developed. His works fill four folio volumes. His *Letters*, and, still more, his *Dialogues*, abound with miraculous and legendary narratives, which, however uncritical in their character, are most interesting as illustrating the manners and habits of thought of that age. Gregory, with all his zeal for the diffusion of Christianity, was most gentle in his treatment of heathens and Jews, and he used all his efforts to repress slave-dealing, and to mitigate the severity of slavery. He died March 12, 604.

GREGORY II., by birth a Roman, was elected bishop of that see in 715. His pontificate is specially noticeable as forming an epoch in the progress of the territorial pre-eminence of the Roman see in Italy. The Eastern emperors having almost utterly abandoned the government, and, still more, the defense of Italy, and the aggressions of the Lombards becoming every year more formidable, the imperial authority in the west sunk into little more than a name; and the tyrannical and barbarous measures by which the emperor Leo, the Isaurian, attempted to enforce his degrees against image-worship, weakened still more the tie which bound Italy to the eastern emperors. The natural result of the diminution of the imperial authority in Italy was the growth of that of the pope, to whom the deserted Italian provinces looked, partly as their spiritual counselor and head, partly as their mediator with the barbarous enemy, partly as the center of the political federation for self-defense which their very isolation necessitated. Gregory convened a council in Rome on the subject of the honor due to images, and addressed a very energetic letter to the emperor, protesting against the sacrilegous outrages of which he had been guilty, explaining and defending the Catholic doctrine on image-worship, and warning the emperor that the feelings of his subjects were so completely alienated by his conduct, that it was only the pope's influence which prevented them from throwing off all allegiance. Gregory has been accused of himself fomenting this disaffection. The contrary, however, is attested, not only by Gregory's own letters, but also by Paul the deacon, in his *History of the Lombards* (book vi. c. 39); and it is quite certain that the circumstances themselves, and the well-known character of the emperor, would sufficiently explain any degree of discontent in Italy. At all events, the result of the contest was a most notable aggrandizement of the political authority and influence of the popes in Italy. Gregory II. died in 731.

GREGORY III., a native of Syria, succeeded Gregory II. in 731. The encroachments of the Lombards in Italy during his pontificate became so formidable, that as the eastern emperors still remained powerless or indifferent to the protection of the Italian provinces, the Romans charged Gregory to send a deputation to Charles Martel soliciting his succor against the enemy, and proposing, upon that condition, to recognize him as their protector, and to confer on him the title of consul and patrician of Rome. This offer was made by the pope "in virtue of a decree of the Roman primus," and is of great historical importance in the consideration of the nature and origin of the papal power in Italy. The embassy failed, owing to the pressure of his war with the Saracens, to enlist the aid of Charles; but it was a step towards the consummation of the independence of the west. Gregory III. died in 741.

GREGORY IV., d. 844. He was a native of Rome, and was raised to the chair of St. Peter in 827. He is remembered for re-building Ostia as a defense for the mouth of the Tiber.

GREGORY V. (BRUNO), d. 999. He was a relative of the emperor Otho II., and was pope from May 996 until his death. His authority was disputed by an antipope, John XVI.

GREGORY VI., JOHN GRATIANUS, a priest in Rome, chosen pope in 1045. He resigned the next year, and a year afterwards died in the monastery of Cluny.

GREGORY VII., pre-eminently the historical representative of the temporal claims of the mediæval papacy, was b., about 1020, at Saona, a village in the southern border of Tuscany. Whether his family belonged to the burgher or the noble class, is disputed by his biographers. His family name, Hildebrand, would imply a Teutonic descent; but by birth and education, at least, he was Italian. His youth was passed at Rome, in the monastery of St. Mary on the Aventine, of which his uncle, Laurence (afterwards bishop of Amalfi), was abbot. From Rome he passed into France, where he entered the celebrated monastery of Cluny, in the schools of which he completed his education; and from the strict ascetic observances there practiced by him, he acquired those habits of austerity which distinguished his entire life. He visited the court of Henry III., and obtained by his preaching the reputation of great eloquence. On his return to Rome, he became the chaplain of Gregory VI., but after the death of that pontiff, he again withdrew to his former retreat at Cluny, from which he was only recalled by the earnest appeal of the new and zealous pope, Leo IX., whom he accompanied to Rome, in 1049. Under this active and devoted pontiff, Hildebrand exercised great influence. He now, for the first time, entered into holy orders, and was eventually created cardinal. Besides the important domestic employments which were assigned to him, he was sent as legate to the important council of Tours, in which the cause of Berengar was examined. Under all the short but important pontificates of the successors of Leo IX., who are known in history as the German popes—Victor II., Stephen IX., Benedict X., and Alexander II.—Hildebrand continued to exercise the same influence, and by inspiring into their government of the church the great principles to which his life was vowed, he prepared the way for the full development of his own theory of the papacy. He was unanimously elected at Rome, without awaiting the imperial authorization, three days after the death of Alexander II. The German bishops, who feared the strong arm of those reforms of which his name was a guarantee, endeavored to prevent the emperor Henry IV. from assenting to the election; but Henry gave his approval,

and the new pope was crowned, July 10, 1073. From the date of his election, the pontificate of Gregory was one life-long struggle for the assertion of the principles with which he believed the welfare of the church and the regeneration of society itself to be inseparably bound up. Regarding as the great evil of his time the thoroughly secularized condition of the church in a great part of Europe, and especially in Germany and northern Italy, he directed against this all his efforts. The position occupied by the higher clergy as feudal proprietors, the right of investiture with the temporalities of benefices claimed by the crown, the consequent dependence of the clergy upon the sovereign, and the temptation to simony (see SIMONY) which it involved, were, in the mind of Gregory, the cause of all the evils under which Europe was groaning; and of all these he regarded investiture (see INVESTITURE) as the fountain and the source. While, therefore, he labored by every species of enactment, by visitations, by encyclical letters, and by personal exhortations, precepts, and censures, to enforce the observance of all the details of discipline—celibacy, the residence of the clergy, the instruction of the people—and to repress simony and pluralism, it was against the fundamental abuse of investiture that his main efforts were directed. In the year after his election he prohibited this practice, under pain of excommunication both for the investor and the invested, and in the following year he actually issued that sentence against several bishops and councilors of the empire. The emperor Henry IV. (see HENRY IV.), disregarding these menaces, and taking the offending bishops under his protection, Gregory cited him to Rome, to answer for his conduct. Henry's sole reply was a haughty defiance; and in a diet at Worms, in 1076, he formally declared Gregory deposed from the pontificate. Gregory was not slow to retaliate by a sentence of excommunication; and in this sentence, unless revoked or removed by absolution in twelve months, by the law of the empire at the time, was involved the forfeiture of all civil rights, and deposition from every civil and political office. Henry's Saxon subjects appealing to this law against him he was compelled to yield, and, by a humiliating penance, to which he submitted at Canossa, in Jan., 1077, he obtained absolution from the pope in person. This submission, however, was but feigned; and on his subsequent triumph over his rival, Rudolf of Swabia, Henry resumed hostilities with the pope, and in 1080 again declared him deposed, and caused to be appointed in his place the anti-pope Guibert, archbishop of Ravenna, under the name of Clement III. After a protracted siege of three years, Henry, in the year 1084, took possession of Rome. Gregory shut himself up in the castle of St. Angelo. Just, however, as Gregory was on the point of falling into his enemy's hands, Robert Guiscard, the Norman duke of Apulia, entered the city, set Gregory free, and compelled Henry to return to Germany; but the wretched condition to which Rome was reduced obliged Gregory to withdraw first to Monte Cassino, and ultimately to Salerno, where he died, May 25, 1085. His dying words are a deeply affecting, but yet a stern and unbending profession of the faith of his whole life, and of the profound convictions under which even his enemies acknowledge him to have acted. "I have loved justice and hated iniquity; therefore I die an exile." The character of Gregory VII., and the theory of church-polity which he represents, are differently judged by the different religious schools; but his theory is confessed by all, even those who most strongly reprobate it as an excess, to have been grand in its conception, and unselfish in its object. "The theory of Augustine's city of God," says Milman, "no doubt swam before his mind, on which a new Rome was to rise, and rule the world by religion." In his conception of the constitution of Christian society, the spiritual power was the first and highest element. It was to direct, to command the temporal, and, in a certain sense, to compel its obedience; but as the theory is explained by Fenelon, by Gosselin, and other modern Catholics, the arms which it was authorized to use for the purpose of coercion were the arms of the spirit only. It could compel by penalties, but these penalties were only the censures of the church; and if, in certain circumstances, temporal forfeitures (as in the case of Henry IV.) were annexed to these censures, this, it is argued, was the result of the civil legislation of the particular country not of any general ecclesiastical law. Thus, in the case of Henry, the imperial crown was forfeited, according to the Swabian code, by the mere fact of the emperor's remaining for twelve months under excommunication without obtaining absolution from the sentence. Moreover, whatever may be said of the power in itself, or of the lengths to which it has at times extended, the occasion and the object of its exercise in the hands of Gregory were always such as to command the sympathy of the philosophical student of the history of the middle age. By his firm and unbending efforts to suppress the unchristian vices which deformed society, and to restrain the tyranny which oppressed the subject as much as it enslaved the church, he taught his age "that there was a being on earth whose special duty it was to defend the defenseless, to succor the succorless, to afford a refuge to the widow and orphan, and to be the guardian of the poor." Dean Milman sums up his history of Gregory as of one who is to be contemplated not merely with awe, but in some respects, and with some great drawbacks, as a benefactor of mankind.—See Milman's *Latin Christianity*, vol. iii.; Bowden's *Life of Gregory VII.* (1840); Voigt's *Hildebrand als Papst;* Villemain's (1872) and Langeron's (1874) lives of Gregory.

GREGORY VIII., ALBERTO DE MORA, succeeded pope Urban III., Oct. 21, 1187. Eight weeks afterwards he died.

GREGORY IX., UGOLINO, became pope in 1227, and died 1241. He had a long dispute with the emperor Frederick II., whom he twice excommunicated. The emperor marched upon the papal territories, took Ravenna, and intercepted a fleet from Genoa which was conveying a hundred church dignitaries to Rome. Gregory died before the trouble was settled, and his successor made haste to become the friend of the emperor.

GREGORY X., TEBALDO VISCONTI, 1209–76; canon, archdeacon, cardinal, and pope, Sept. 1, 1271. He held the second general council of Lyons, and was one of the last church leaders to urge crusades for the recovery of the holy land where he had once been papal legate.

GREGORY XI., PIERRE ROGER, 1329–78; the last of the French popes, having been chosen in 1370. He was the last pope to reside in Avignon, and himself removed thence to Rome. The works of Wycliffe came under his censure.

GREGORY XII., ANGELO CORARIO, 1325–1417; a Venetian, chosen pope, in 1406. He pledged himself (to the council of Constance) to abdicate the moment other contestants for the chair of St. Peter did so, and finally abdicated.

GREGORY XIII., HUGH BUONCOMPAGNO, was b. at Bologna, Jan. 7, 1502. He was educated in his native city, where he held the professorship of law for several years. Having settled at Rome, in 1539, he was distinguished by several important employments, and was one of the theologians of the council of Trent, on his return whence, he was created cardinal in 1564, and sent as legate to Spain. On the death of Pius V., Gregory was elected pope in 1572. Not one among the post-reformation pontiffs has surpassed Gregory in zeal for the promotion and improvement of education; a large proportion of the colleges in Rome were wholly or in part endowed by him; and his expenditure for educational purposes is said to have exceeded 2,000,000 Roman crowns. The most interesting event of his pontificate, in a scientific point of view, is the correction of the calendar (see CALENDAR), which was the result of long consideration, and was finally made public in 1582. A grievous imputation rests on the memory of Gregory from the fact of his having ordered a *Te Deum* in Rome on occasion of the massacre of St. Bartholomew (see ST. BARTHOLOMEW); but in justice it must be said, that this was done on the report of the French ambassador, which represented that bloody event, not as a deliberate aggression on the part of the Catholics, but simply as the suppression of a baffled Huguenot conspiracy. Gregory published a valuable edition of the *Decretum Gratiani* with learned notes. He died in 1585, in the 83d year of his age.

GREGORY XIV., NICOLO SFONDRATI, d. 1591; a native of Cremona. He was elected to the papacy in 1590, and died the next year.

GREGORY XV., ALESSANDRO LUDOVISIO, 1554–1623; a native of Bologna, chosen pope in 1621. The congregation for the propagation of the faith was established by him; and to him is due the secret balloting for new popes.

GREGORY XVI., BARTOLOMMEO ALBERTO CAPELLARI, 1765–1846; a Venetian who became a monk, was learned in eastern languages, and a teacher of theology. When Napoleon carried Pius VII. away as a prisoner in 1809, Capellari left Rome for his native place and remained in quiet for three years. On the return of the pope he was promoted to various important positions, and in 1826 was a cardinal and the prefect of the propaganda. In this capacity he was practically minister of foreign affairs. He made an agreement with the Netherlands touching Roman Catholic citizens, regulated church matters in the United States, and from the sultan got emancipation for the Catholics in Armenia. He was elected to the papacy Feb. 2, 1831, and for 15 years was zealous and energetic in promoting the interests and expanding the power and influence of the church.

GREGORY OF ARMENIA, commonly called THE ILLUMINATOR, was the apostle of Christianity among the Armenians. Like the majority of the bishops of the primitive church, little is known of his early history. He is said to have been educated at Cæsarea, in Cappadocia, where, at the same time, he was instructed in the Christian religion. He afterwards entered into the service of Tiridates, king of Armenia, by whom he was subjected to severe persecution on account of his refusal to worship idols. Some severe public calamity which succeeded, being looked upon as a proof of divine wrath, the king immediately put himself and his subjects under Gregory's instructions. The people were converted in great numbers, and churches immediately erected throughout the country; and Gregory, after receiving ordination at Cæsarea, returned as metropolitan of Armenia, and baptized his converts. This took place about the beginning of the 4th century. Many authors have given in their works discourses professedly by Gregory, but now believed to be spurious. The memory of Gregory is held in great reverence in the Greek, Coptic, Abyssinian, and Armenian churches, and he is one of the saints of the Roman calendar.

GREGORY, FRANCIS H., 1789–1866; b. Conn.; from merchant service he went into the navy in 1809, and rose through all grades to rear-admiral. His first work was in capturing vessels running slaves into southern ports, and suppressing piracy. In the war of 1812 he was captured and kept in England a prisoner for a year and a half. In

the war with Mexico he took an active part. When the rebellion began he was too old for active sea service, and was made superintendent of the construction of iron-clad vessels.

GREGORY OF NYSSA, SAINT, a Greek church-father, and the younger brother of Basil the great, born about 332 at Sebaste, devoted himself at an early age to the study of sciences and philosophy, and subsequently married a pious and honorable lady. In consequence of a dream, however, he separated from her, and abjuring the world, entered upon the duties of an ecclesiastic. After a short relapse into his old profane studies, he renounced this "apostasy" forever, and in 372 was made bishop of Nyssa, a city in Cappadocia, in Lesser Armenia, much to the dismay of the Arians, who knew him to be a zealous defender of the Nicene creed. They at once commenced an opposition to him. Gregory was deposed by the emperor, and compelled to flee. He lived for some years in seclusion, until, at the death of Valens (378), Gratianus restored him to his see. In 379 he was charged by the council at Antioch, to visit the churches in Arabia and Palestine, in order to restore them to their pristine orthodoxy and peace, the many years of heresy and dissension that had preceded having created a sad confusion among the flock of the faithful. In 381 he was chosen by the council of Constantinople to be one of the "centers" of faith for the Catholic communion, i.e., an arbiter of orthodoxy for his and other congregations, principally in Pontus. He further assisted at the council held in that city in 382 and 383, and played so prominent a part in both, that shortly afterwards the honorable title of metropolitan was unanimously conferred upon him. The last time Gregory seems to have appeared publicly, was at the council of Constantinople in 394; and he seems to have died shortly afterwards. The second Nicæan council conferred upon him the pre-eminent title of "Pater Patrum."

His writings are extremely numerous. Although not fraught with the glowing eloquence and penetrating acumen of a Gregory Nazianzen, or a Basil, they exhibit a greater depth of poetical feeling and philosophical thought, while, at the same time, they abound in practical teachings and wise counsels for every stage of life. The fanciful, often puerile subtleties and conceits which occur no less frequently, are rather to be put to the account of the times in which Gregory lived, when symbolism and allegory reigned supreme. On the other hand, Gregory cannot be praised too highly for having been one of the first who manfully stood out for the ancient Greek—albeit heathen—philosophy. His writings are indeed fully imbued with Platonism and Aristotelianism, and he went as far as to borrow the technical terms of these masters for his theological investigations. "As the Israelites borrowed from the Egyptians," he said, "so Christianity must carry along with it all that is costly out of the pagan camp;" a saying which, however, has been attributed to some other fathers of the early church. His orthodoxy has been questioned in later times; chiefly on account of his strongly condemning as heathenish, the view that religion was mostly dependent on the dogma: according to him, religion was more a matter of the heart and of feeling. The council of Ephesus solemnly and most energetically declared for the soundness of his teaching, refuting the heretics out of his own writings. Of his Christology—in the main that of Origen—viz., that the Logos had penetrated all parts of the human nature, and thus elevated it to himself, we will treat under this latter. The Latins celebrate the day of Gregory on Jan. 10, the Greeks on Mar. 9. His most celebrated works are a catechetic treatise; a dialogue of the Soul and Resurrection, called *Macrinia*, after his sister (supposed to have been held at her death-bed); a treatise on *The Holy Trinity and the Deity of the Holy Ghost*, besides a number of homilies. The first complete Latin edition of his writings, comprising dissertations on the Old and New Testament, dogmatical and controversial treatises, discourses, sermons, panegyrics, biographies, letters, etc., appeared at Cologne in 1537 (folio), and was followed by others at Basel (1562 and 1571), and Paris (1573 and 1603). The first Greek and Latin editions by the Jesuit Gretier appeared in Paris (1615–18), 2 vols., fol., and was reprinted there in 1638. Separate works of Gregory have been edited repeatedly, but next to none have appeared in any modern translation.

GREGORY, OLINTHUS GILBERT, LL.D., 1774–1841; b. England; a mathematician; author of *Use of the Sliding Rule*, and *Treatise on Astronomy;* prof. at Woolwich. Among his works are a *Treatise on Mechanics, Evidences of Christianity*, and lives of Robert Hall and Mason Good.

GREGORY, SAINT, the "Illuminator;" b. 257 A.D.; founder and patron saint of the Armenian church. He belonged to the royal race of the Arsacides, being the son of a certain prince Anak, who assassinated Chosroes of Armenia, and thus brought ruin on himself and his family. His mother's name was Okohe, and the Armenian biographers tell that at the time of his conception he came under the holy influence of the apostle Thaddeus. Educated by a Christian nobleman, Euthalius, in Cæsarea in Cappadocia, Gregory sought, when he came to man's estate, to introduce the Christian doctrine into his native land. At that time Tiridates I., a son of Chosroes, sat on the throne, and, influenced partly it may be by the fact that Gregory was the son of his father's enemy, he subjected him to much cruel usage, and imprisoned him for fourteen years. But vengeance and madness fell on the king, and at length Gregory was called forth from

his pit to restore his royal persecutor to reason by virtue of his saintly intercession. The cause of Christianity was now secured; king and princes and people vied with each other in obedience to Gregory's instructions, and convents, churches, and schools were established. Gregory in 302 received consecration as patriarch of Armenia from Leontius of Cæsarea, and in 318 he appointed his son Aristax to be his successor. About 331 he withdrew to a cave in the mountain Sebuh in the province of Daranalia in upper Armenia, and there he died a few years afterwards unattended and unobserved. When it was discovered that he was dead his corpse was removed to the village of Thordanum or Thortan. The remains of the saint were scattered far and near in the reign of Zeno. His head is said to be now in Italy, his right hand at Etchmiadzin, and his left at Sis.

GREGORY, OF TOURS, originally called GEORGIUS FLORENTINUS, b. 544 at Auvergne, in a family exalted by rank as well as by piety. On the paternal side, he traced his descent from Vallius Epagatus, the martyr of Lyons; on the maternal, from St. Gregory, Bishop of Langres. St. Gallus, Bishop of Clermont, Gregory's uncle, undertook his early education, and, after his death, Gregory continued his studies under St. Avitus, the successor of Gallus in the bishopric. Ordained deacon, Gregory left Auvergne, and went to the court of Siegbert, king of Austrasia. Still very young, he was elected to the see of Tours, and he was consecrated by Giles, Archbishop of Rheims. The first years of his episcopacy were a season of great perplexity, owing to the constant contentions of the first Merovingian kings. His courage and firmness, however, were equal to any of the severe tests to which they were exposed, and by openly resisting even royal authority on some occasions, he drew upon himself the hatred of Queen Fredegunda, and the ire of her husband, King Chilperich, who seems to have been a mere tool in her hands. Gregory was accused of seditious and other treasonable actions, and summoned before a council of bishops in 580. Here, however, he defended himself with such clearness and vigor, that Chilperich himself, strange to say, from that moment ceased to be his foe, and becoming even his warm admirer and friend, charged him afterwards with many important political missions. This royal partiality, however, does not seem to have prevented Gregory from occasionally calling the king a Herod and a Nero. No less favored by the king's successors, Gontram and Childebert II., Gregory did not fail to use all his influence with the court for the amelioration of the position of the church, and the general condition of his flock. His travels had, apart from their political purposes at the same time the object of everywhere restoring peace and piety, so much needed in those days in convents and churches, among the clergy and the laity. Of his journey to Rome in 590, the circumstances of which are related with a minuteness of itself surprising; of the pope's wonder at finding in Gregory, instead of the imposing man he had expected to behold, a *homuncio*, or manikin, and of his answer, that "we all are as God had made us," we can only say, that according to the lucid investigations of Dr. Kries (*De Greg. Tur. Vita et Scriptis*, p. 16) it never can have taken place. His last journey seems to have been to Orleans, whither he accompanied the king in 593. He died shortly after, in 594 or 595 at Tours, where he had been a bishop for twenty-three years. His works comprise, in the first place, his ten books of Frankish history, *Gesta, Chronicon Francorum*—the first attempt at French historiography—and have earned for Gregory the name of "Father of Frankish History," although its crudity of style, and indiscriminate mixing up of everything important and otherwise, make it partake much more of the nature of a chronicle than of a history properly so-called. Gregory's other works are: *A Book of the Glory of the Martyrs; Of the Miracles of St. Julian* (304); *Of the Glory or Miracles of the Confessors; Of the Miracles of St. Martin;* and a book of the lives of the Fathers, consisting of 23 biographies of Frankish ecclesiastics, and many other minor writings. Much more, however, is generally attributed to Gregory than is in reality his. The first critical edition of his works, by Ruinard, appeared in Paris, 1699, fol.; the latest, by Guadet and Taranne, Paris, 1836 and 1837, with a French translation. Of monographies on Gregory, we may mention *De Greg. Tur. Episc. Vita et Scriptis*, by C. G. Kries and Löbell; *Gregor von Tours und Seine Zeit* (Leip. 1835, 8vo).

GREGORY, NAZIANZEN—from his erudition in sacred literature also called the THEOLOGIAN—was b. about 329 at Arianzum, a village near Nazianzus, in Cappadocia, not far from Cæsarea. His father, whose name also was Gregory, and who had originally belonged to the heathen sect of Hypsistatics, i.e., worshipers of the Most High, but also of the fire, like the Persians, and the keepers of the Jewish Sabbath and the law of the purity of meats, had, chiefly at the instigation of his pious wife Nonna, become a convert to Christianity about the time of the great Nicæan council (325), and four years later was raised to the dignity of Bishop of Nazianzus. Formed to piety by domestic example, Gregory was at an early age sent, for the purpose of finishing his education, to Cæsarea, in Palestine, where the study of eloquence then flourished. He then visited the schools of Alexandria, and subsequently of Athens, where he met Basil the great, then also a young student, and became his most intimate friend. At the same time, there studied at Athens, Julian, later emperor and apostate, and there is no doubt that the three often met and had friendly discussions on the subjects of their common studies; although Gregory, even at that time, augured no good for Julian, who

exhibited signs of "an unsettled and arrogant mind." Gregory having made brilliant progress in eloquence, philosophy, and sacred literature, returned to Nazianzus, and here first received baptism at the hands of his own father, consecrating to God, at the same time, all "his goods, his glory, his health, his tongue, and his talents;" and, in order to be still more able to pursue a life of austere devotion, he retired into solitude, and took up his abode with Basil in the desert near the river Iris, in Pontus. Recalled by his father, Gregory was ordained priest, and afterwards fled; and being recalled a second time, he returned to Nazianzus, assisted his father in the ministry, and preached to the people. In 371 or 372 St. Basil, who in the meantime had become Bishop of Cæsarea, prevailed upon him to accept the see of Sasime, a small town in Cappadocia. But he had scarcely taken possession of his new dignity, when, overcome again by his innate repugnance of public life, he retired, a bishop without a bishopric, to Nanianzus, where he stayed until the death of his father in 373. He then went into a monastery at Seleucia, which, however, after the death of the Emperor Valen (378), he was induced to leave, in order to undertake the charge of a small Nicæan congregation in Constantinople, where, until then, Arianism had held undisputed sway. Gregory was after a short time, when his erudition and eloquence became conspicuous, elected archbishop, upon which the Arians became so exasperated that his very life was in danger. Gregory, although upheld by the Pope Damasus and the Emperor Theodosius, preferred resigning his see voluntarily, "in order to lay the storm, like another Jonah, although he had not excited it." He went back to Nazianzus, and took up his solitary abode near Arianzus, where, after some years of a most ascetic life, he died in 389. His ashes were conveyed to Constantinople, and thence, during the Crusades, to Rome. His day is, with the Latins, May 9. His character and temper, ardent and enthusiastic, but at the same time dreamy and melancholy, hard, but also tender, ambitious and yet humble, all his instability and vacillation between a life of contemplation and of action, are vividly depicted in his writings, which mostly serve the great aim of his life—to uphold the integrity of the Nicæan orthodoxy against the heresies of the Arians and Apollinarists. The merits of his writings—which vividly portray the instability and vacillation of his life—are very unequal; sometimes not inferior to the sublimest flights of poetical genius, and withal of a classical elegance and refinement, they at other times become redundant, pedantic, and heavy with far-fetched similes. Notwithstanding all this, Gregory may fairly be pronounced one of the first orators, and most accomplished and thoughtful writers of all times. His surviving works consist chiefly of about 53 orations, 242 letters, and 156 poems—meditations, descriptions, acrostics, epigrams, etc.—to which Tollius (Utrecht, 1696) has added 20 more, which he called *Carmina Cygnea*. Muratori published (Padua, 1709) 228 other unedited epigrams. The first edition of his complete works appeared at Basel in 1550, folio. Another edition appeared in Paris 1609—1611 (2 vols. fol.), by Morel, which was reprinted in Paris in 1630; Leipsic (or rather Cologne), 1690, and Venice, 1753; but none of these is sufficiently accurate. The last edition, but little improved, under the auspices of the Benedictines, appeared in 2 vols. (Paris, 1760—1840). His separate works have frequently been edited, and partly translated into different tongues.

GREGORY THAUMATUR'GUS, Wonder-worker, originally called THEODORUS, SAINT, b. at Neocæsarea, in Pontus, between 210 and 215. Sprung from an illustrious and wealthy heathen family, he was educated for a rhetorician or advocate; but an acquaintance which he formed with Origen at Cæsarea, in Palestine, allured him to the field of sacred science. Gregory forgot Roman law, applying himself instead, under his new master, with zeal and fervor to the study of the Holy Scriptures and of profane philosophy. Several years had thus passed, when Maximin's persecutions forced Origen to leave Cæsarea. Gregory then went to Alexandria, and stayed there for three years (235–238). Gordian having succeeded Maximin, Origen returned to Cæsarea, and Gregory went to join him there, and to renew his former studies under him. Most probably it was at that period also that he was baptized, and changed his heathen name of Theodorus. Recalled to his family, Gregory, instead of striving for those posts of honor for which he had been destined, retired into solitude; but was so often besought to return and labor for the church, that he allowed himself to be consecrated about 240. Installed as bishop at Neocæsarea, a wealthy and populous, but utterly unchristian city, Gregory applied himself to his holy work with the utmost zeal. He wrought, according to ancient testimony, many miracles, such as recalling devils, whom he had frightened out of a heathen temple, at his will, and thereby converting its chief functionary to Christianity; moving a stone, staying a river, killing a Jew by his mere wish, changing a lake—a matter of contest between two brothers—into solid earth, and thus contrived to change the unbelieving population of his see into devout Christians.

During the persecution of Decius, which broke out in 250, Gregory fled with a great part of his flock, whom he would not see exposed to the danger of having either to change their faith, or to die the death of martyrs, and during this flight, he, once when hard pressed by his pursuers, transformed himself and his deacon—the heathen priest whom he had converted by recalling the devils—into trees. In 251 the emperor Decius died, and Gregory returned to Neocæsarea. He now instituted a general festival for those Christians who had fallen during the persecution, and permitted the faithful to

celebrate it with banquets and sports like those which accompanied heathen festivals—a proceeding by which he intended to draw over the pagan multitude to Christianity, but which has been severely blamed, and which, indeed, was fraught with great mischief for the church in later times.

In 264 we find him, together with his brother Anthenodorus, at the council of Antioch, which had been convoked for the purpose of condemning the heresies of Paul, bishop of Samosata, their signatures occurring first in the acts of the council. Whether or not Gregory also took part in the second council (269), necessitated by Paul's refusal to abdicate, is very uncertain. Of his own extraordinary piety, devotion, truthfulness, and modesty, of his "prophetic and apostolic temper," the best testimony lies in the fact that St. Basil, St. Maximus, and other great luminaries of the church, call him a second Moses or Paul.

The only genuine works of Gregory are a panegyrical discourse on Origen, which he delivered in public before his return to his native place; the above-mentioned creed; a metaphrasis on Ecclesiastes, often and wrongly attributed to Gregory of Nazianzus, in twelve chapters; and a canonical Epistle, setting forth the punishments and penances to be undergone by such Christians as had bought booty from pagan soldiers, a practice very common in those times of constant invasions of Goths and Scythians in Asia, principally in Pontus. All other writings shown under his name are spurious. The first collected edition of his works was published by Ger. Vossius at Mayence in 1604; a more complete edition appeared in Paris, 1622, in folio.

GREIFENBERG, a small manufacturing t. of Prussia, in the province of Pomerania, is situated on the left bank of the Rega, 40 m. n.e. of Stettin. It is a decayed place, but has still some manufactures of stoves and of linen. Pop. '75, 5,630.

GREIFENHAGEN, a t. of Prussia, in the province of Pomerania, is situated on the right bank of the Reglitz, 13 m. s.s.w. of Stettin. The t. has two churches, and is the seat of considerable industry. Pop. '75, 6,759.

GREIFSWALD, a t. of Prussia, in the province of Pomerania, is situated on the Rick, about 3 m. from its mouth, and 20 m. s.e. of Stralsund. It is regularly built, and is surrounded by promenades, into which the former ramparts have been converted. Among its houses are several curious brick structures, dating from the 14th and 15th centuries. Greifswald contains, besides other public institutions, a gymnasium and a university (founded in 1456), attended by about 500 students. The university library contains about 130,000 volumes. Weaving, machine-making, salt-works, and manufactures of paper, tobacco, soap, leather, and oil are carried on, as well as commerce. Greifswald possesses some 60 ships of about 16,000 tons. Pop. '75, 18,016.

Greifswald was founded in the 13th c., before the close of which it made one in a union of Wendish Hansetowns, comprising Stralsund, Rostock, Weimar, and Lubeck. At the peace of Westphalia (1648), the town came into the possession of Sweden; but, together with the whole of Swedish Pomerania, it was conceded to Prussia in 1815.

GREINER, JOHN, 1810–71; b. Penn., but early removed to Ohio, where he was conspicuous as a whig leader. He was the first to introduce popular songs in campaign work, and wrote a large number. He was governor of New Mexico in 1852. Afterwards he edited the *Columbus Gazette* and the *Zanesville Times*. His last public position was sub-treasurer in Santa Fé.

GREIZ, a t. of central Germany, capital of the principality of Reuss-Greiz, and seat of the sovereign prince, is charmingly situated on the right bank of the White Elster, 49 m. s.s.w. of Leipzig. It is well-built, is surrounded by walls, and contains three castles, one for winter, another for summer occupation, with beautiful gardens and park; the third, which is built on an isolated rock, is used for public offices. The town-house, a handsome specimen of Gothic, was built in 1841. Nearly 3,000 hand-looms are here employed in the manufacture of woolen and half-woolen goods; one factory contains 500 looms. Pop. '75, 12,657.

GRELLET, STEPHEN, 1773–1855; b. France. He was one of the body guard of Louis XVI.; but after the king's execution fled to Demerara. He was in New York in 1795, and there abjured the Roman Catholic religion and joined the Friends. During the yellow fever in Philadelphia in 1798, he was untiring in attentions to the sick and the dying. Subsequently he traveled over the union, Canada, England, France, Germany, and the Scandanavian kingdoms as a missionary. He also visited Russia, Greece, and Italy; and held audiences with the czar and pope, delivering a sermon before his holiness. A few years afterwards he made another tour in Europe, when he settled in Burlington, N. J., where he died.

GRENADA, an island of volcanic origin in the British West Indies, is said to be the most beautiful of the Caribbees. With an area of 133 sq.m., it contained in 1871, 37,684 inhabitants, mostly of African descent. Of these only 400 or 500 are whites, the rest are people of color. Very considerable importations of coolies have taken place. On the coast are several good harbors; while a central ridge of mountains here and there presenting an elevation of 3,000 ft., possesses various extinct craters, some of them transformed into considerable lakes. The chief towns are St. George, St. Mark, St. Patrick, St. Andrew, and Charlotte Town. The first of these, which is the seat of

government, stands in lat. 12° 2′ n., and in long. 61° 48′ west. In 1866 there were 27 schools, consisting of the normal and grammar school, the central schools, and parish schools, with an attendance of 1418. The public revenue amounted in 1875 to £26,570. The imports and exports were respectively represented by £118,385 and £171,332; the corresponding results in 1833, virtually the last year of unmitigated slavery, having been £73,846 and £288,683. Among the exports are sugar, cotton, and cocoa; the last of which seems likely to become the staple.—The island was discovered by Columbus on his third voyage in 1498, at which time it was inhabited by Caribs, who were subsequently exterminated by the French, into whose hands Grenada came about the middle of the 17th century. It finally fell into possession of the British in 1783.

GRENADA, a co. in n. central Mississippi on Yellabusha river, and the New Orleans, St. Louis and Chicago railroad; 450 sq.m.; pop. '70, 10,751—6,642 colored. The surface is level, and about half is covered with forests. The soil is good; chief productions: cotton, corn, and pork. Co. seat, Grenada.

GRENADE', a small shell, about three in. in diameter, of iron or annealed glass, filled with powder, and thrown from the hand. Hurled among dense masses of troops, as those assembled in the ditch of a fortress during an assault, grenades are particularly embarrassing, the splinters inflicting deep wounds and causing great confusion. The discharge is effected by means of a small time-fuse. Grenades are occasionally rolled over the parapet, through wooden troughs, into the trench below; there is also a species of hand-gun fired from a rest, called "musketon," from which grenades may be projected to a short distance. These missiles are said to have been first used in the year 1594.

GRENADIER', originally a soldier who was employed in throwing hand-grenades, but in modern parlance a member of the first company of every battalion on foot, in which the tallest and finest men of the regiment are placed. This company used to be distinguished from the rest by tall bear-skin caps; it holds the place of honor, viz., the right, when in line, and the front when in column of attack.

GRENADIER GUARDS, the first regiment of foot guards in the British household brigade of guards, and generally considered the finest corps in the army. It comprises 2,540 officers and men, divided into three battalions. The officers of this fashionable corps are usually from the families of the nobility or more distinguished landed gentry. The first foot guards, under which name the regiment was originally known, was first raised in 1660; since then it has ever borne an honorable position in all the wars of the country, and especially in the Peninsula, at Waterloo, and in the Crimea.

GRENADINES', a chain of islets in the West Indies, extending between Grenada, on which they are chiefly dependent, and St. Vincent, from lat. 12° 30′ to 13° north. They vary in size from about 7,000 acres downwards. The largest is Carriacou. Much inconvenience is caused by their deficiency in streams and springs, an evil which, of late years, has been increasingly felt, from the injudicious destruction of the timber.

GRENELLE, a suburb of Paris (q.v.).

GRENO'BLE (a corruption of the Lat. *Gratianopolis*, or City of Gratian), an important town and strong fortress of France, with double inclosures, capital of the department of Isère, is pleasantly situated on both banks of the river of that name, in a beautiful and fertile district, surrounded by high mountains, and about 58 m. s.e. of Lyon. It is divided by the Isère, which is here confined within handsome quays, into two unequal portions: the one, narrow and contracted, and consisting of only two streets, situated on the right bank of the river at the foot of a hill, is called Saint Laurent; the other, a much more important quarter, containing all the public buildings, and consisting of spacious and well-lighted streets, on the left bank, is called Bonne. Among the public buildings are the Palais de Justice, with a Gothic oriel, originally the palace of the Dauphin, and the most interesting old building in the town; the Académie Universitaire; the town-hall; the public library, containing 100,000 volumes and 1500 MSS.; and the picture-gallery. Grenoble has gained a reputation for its manufactures of gloves (in making which above 20,000 persons are employed at more than 100 factories), leather goods, watches, liquors, perfumes, chemicals, and silk. There is besides a brisk trade in hemp, iron, wood, and cheese. Pop. '76, 43,054.—Grenoble, originally a city of the Allobroges, was fortified by the Romans. It was Burgundian in the 5th c., and later belonged to Dauphiné.

GRENVILLE, a co. in Ontario, Canada, on the St. Lawrence and Rideau rivers, and traversed by the Grand Trunk and the St. Lawrence and Ottawa railroads; 464 sq.m.; pop. '71, 22,616. Chief town, Prescott.

GRENVILLE, GEORGE, an English statesman and reputed author of the stamp act, which first drove the American colonies into resistance, was born in Oct., 1712. He was brother to Richard Grenville, lord Temple, and brother-in-law of the earl of Chatham. He entered parliament in 1741, and from 1744 to 1762 filled several minor government offices. In 1757 he introduced a bill for the regulation of the payment of the navy. In 1762 he became secretary of state, and then first lord of the admiralty; and in the following year he succeeded lord Bute as prime minister, uniting in himself the offices of chancellor of the exchequer and first lord of the treasury. He resigned the premiership

in 1765, and died in 1770. Grenville was distinguished for eloquence, public spirit, business qualities, and extensive knowledge; but his imperious nature made him an unpopular minister, alike with the king, the parliament, and the people.

GRENVILLE, RICHARD TEMPLE. See TEMPLE, EARL.

GRENVILLE, WILLIAM WYNDHAM, Lord, third son of the preceding, was b. in Oct., 1759. After studying at Eton and Oxford with brilliant success, he became a member of the house of commons in 1782, and attended his eldest brother, lord lieutenant of Ireland, in the character of secretary. Soon after he became paymaster-general of the army, and in 1789 was chosen speaker of the house of commons. In 1790 he was appointed secretary of state for the home department, and was raised to the peerage with the title of baron Grenville. He became foreign secretary in the ensuing year. He resigned office, along with Pitt, in 1801, on the refusal of George III. to give his assent to the Catholic emancipation bill. He was premier in 1806–07. In 1809 he was chosen chancellor of the university of Oxford. From 1809 to 1815 he acted along with earl Grey, and he generally supported Mr. Canning. Lord Grenville was an able speaker, with much influence among the peers, and an excellent scholar. He died in 1834.

GRENVILLE, GREENVILLE, or GRANVILLE, Sir RICHARD, 1540–91; a relative of sir Walter Raleigh. While a boy he served against the Turks in a German corps. Returning home, he was given a command in Ireland, and became sheriff of Cork. In 1571 he was in parliament; subsequently, sheriff of Cornwall; again in parliament, and knighted by queen Elizabeth. He was enthusiastic in Raleigh's projects for founding colonies in America, and in 1585 was chief officer of a fleet carrying 108 settlers to Carolina. On the way he captured two Spanish frigates, and finally landed at Roanoke. Leaving the settlers in charge of Ralph Lane, he returned to England, and on the way took a Spanish ship with a rich cargo. He returned the next year with supplies, but found the colony scattered, the people having been taken away by sir Francis Drake. In 1591 he was made rear-admiral, and sent with a small fleet against the Spaniards to the West Indies. Off the Azores he had a hard fight, sinking four of the enemy's ships, and killing, it is supposed, 1000 men. He was wounded, but refused to leave the deck. Finally, he was shot through and died three days afterwards.

GRESHAM, Sir THOMAS, founder of the London royal exchange, descended from an ancient Norfolk family, was the second son of sir Richard Gresham, an opulent merchant, elected in 1537 lord mayor of London. Born in 1519, he was first apprenticed to his uncle, sir John Gresham, a wealthy London mercer, and then sent to study at Gonville hall, now Caius college, Cambridge. In 1543 he was admitted a member of the Mercers' company. His father, who died in Feb., 1548, had been one of Henry VIII.'s domestic financial agents; and in 1552 Gresham was sent to Antwerp, as king's factor there, in consequence of the mismanagement of the person previously in charge. In two years he paid off a heavy loan, entirely restored the king's credit, and introduced a new system of finance. The principal duty of the royal agent was the negotiation of foreign loans; and during the long period he held the office, he was successfully employed in many most important and difficult money transactions. As he was a Protestant, queen Mary, on her accession, sent him his dismissal; but on presenting a memorial of his past services, he was soon reinstated. By queen Elizabeth, he was, in 1559, knighted, and appointed, for a short time, English ambassador at the court of the king of Spain's regent at Brussels. The troubles in the Netherlands compelled him, in 1568, to withdraw finally from Antwerp, to which city he had made more than forty journeys on the service of the state, in one of which, in 1560, he was thrown from his horse, and rendered lame for life. In 1569 by his advice, the plan of borrowing money from the London merchants, instead of from foreigners, was adopted, to the great advantage of the mercantile body. Having, in 1564, lost his only son, Richard, he resolved upon devoting a portion of his great wealth to the erection of a bourse or exchange, in imitation of the one at Antwerp, for the London merchants, who were wont to meet in the open air—a project which had originated with his father. It was formally opened, in 1570, by queen Elizabeth in person, on which occasion she dined with the founder, and named it the royal exchange. Renowned for his hospitality and liberality, he frequently entertained foreign personages of distinction, and erected a magnificent mansion at Osterly park, near Brentford, where he was visited by queen Elizabeth. For the endowment of a college in London, he directed by his will that his town-mansion in Bishopsgate street should be converted into a residence and lecture-rooms for seven professors, to be salaried out of the royal exchange revenues. Gresham college was taken down in 1768, and the ground on which it stood—now occupied by the excise office—was transferred to government. The lectures are now delivered in a lecture-hall built at the corner of Basinghall and Gresham streets, out of the accumulated fund. The subjects of lecture are divinity, physic, astronomy, geometry, law, rhetoric, and music. Gresham also provided for the erection and support of eight almshouses, and made many other charitable bequests. He died suddenly, Nov. 21, 1579.

GRESLON, ADRIEN, 1618–97; b. France. He was a Roman Catholic missionary in the Huron country, and some time later in China. There is a story that he met an

American Indian woman in Tartary who had been sold from one tribe to another. It was discovered from this that there was ready communication between Asia and western America.

GRESSET, JEAN BAPTISTE LOUIS, 1709–77; a French poet, author of *Vert Vert; Le Carême Impromptu; Le Lutrin Vivant; La Chartreuse; Les Ombres;* and other works in verse, and dramatic pieces. In 1748 he was made a member of the Academy. Later in life he became subject to deep religious impressions, and publicly regretted the frivolous nature of some of his writings, for which he was sharply censured by Voltaire.

GRESWELL, EDWARD, 1797–1869; b. England, graduated at Oxford, and turned his attention to theological writing. Among his works are *Exposition of the Parables and Parts of the Gospels; Dissertation upon the Principles and Arrangement of a Harmony of the Gospels,* and a dissertation on the calendar, besides some books in Latin.

GRETA, a river in Yorkshire, Eng., running e. and n. to the Tees. Another of the name is in Cumberland, and empties into the Derwent.

GRETNA GREEN, originally the name of a farmstead in the vicinity of the village of Springfield, in the parish of Graitney, in Dumfriesshire, Scotland, but frequently applied to the village of Springfield itself, which is situated about a mile and a half n. of the north-eastern extremity of the Solway Firth. The village was long the center of extensive smuggling operations, and more recently it became famous (or infamous) for its irregular marriages. See next article.

GRETNA GREEN MARRIAGES, the name given to marriages of English persons contracted at Gretna Green. This spot being the first convenient halting-place for runaway couples from England, gave the name to this kind of marriage, originally an easy mode of evading the English marriage act, which required the consent of parents and guardians, publication of bans, and the presence of a priest—all of which involved considerable publicity and an inconvenient delay, but which were got rid of by the parties passing the English border into Scottish ground. The rule being, that a marriage is valid if contracted according to the law of the place where the parties enter into the contract, it was easy for English couples to avail themselves of the mode of contracting marriage allowed by the law of Scotland, which required nothing but a mutual declaration of marriage to be exchanged in presence of witnesses—a ceremony which could be performed instantly—and it was immaterial whether the parties were minors or not. This declaration generally took place in presence of a blacksmith, who in reality was no more necessary than any other witness, but who gradually assumed an authority which imposed on the credulity of the English strangers, and thereby profited by the liberality usually dispensed on such auspicious occasions for his trifling services. The declaration of marriage being exchanged, the parties could return at once to England, and their marriage was held ever after to be valid there and all the world over.

These marriages have received much discouragement of late. Not only has the strictness of the English law of marriage been dispensed with, by allowing marriages to be contracted in England in comparative secrecy before the superintendent registrar, without going before a priest, but the Scotch law has also been altered, with a view of checking this evasion of English law. By 19 and 20 Vict. c. 96, no irregular marriage of that kind in Scotland is now valid unless one of the parties had at the date thereof his or her usual place of residence there, or had lived in Scotland for 21 days next preceding such marriage. The effect of this statute is, therefore, an obstacle to runaway marriages from England so far that one of the parties must at least have resided in Scotland 21 days.

GRÉTRY, ANDRÉ ERNEST MODESTE, 1741–1813; b. France. He studied music under many disadvantages, but his composition for Marmontel's *Le Huron* brought him at once into notice. After this came *Lucile; Zémire et Azor; Céphale et Procris; Richard Cœur de Lion; Barbe-Bleue,* and many other operas, both comic and serious. He had been 16 years dead when his *William Tell* was produced. Grétry was one of the founders of French comic opera.

GREUZE, JEAN BAPTISTE, 1726–1805; a painter, b. France. Having no success at portraits he undertook compositions on natural subjects and current life, though much preferring allegorical, scriptural, and historical work. Among his best achievements are "The Blind Man Cheated;" "The Village Bride;" "The Broken Pitcher;" "The Unnatural Father," and "The Little Girl and the Dog." Many of his productions have been issued in engravings. He was remarkable as a colorist, particularly for flesh-tints, and for his originality in genre painting.

GREVILLE, CHARLES CAVENDISH FULKE, 1794–1865; great-grandson of the fifth earl of Warwick. He was educated at Eton and Oxford, and became clerk of the council in 1821, which office he held nearly 40 years, serving under three sovereigns. Well-born, well-bred, handsome, and accomplished, Greville led the easy life of a man of fashion, taking an occasional part in the transactions of his day, and much consulted in the affairs of private life. But the celebrity which now attaches to his name is entirely due to the posthumous publications of a portion of a journal or diary which it was his practice to keep during the greater part of his life. These papers were given by him to his friend Mr. Reeve, a short time before his death, with an injunction that

they should be published, as far as feasible, at not too remote a period after the writer's death. The journals of the reign of George IV. and William IV. (extending from 1820 to 1837), were accordingly so published about 10 years after the event. Few publications have been received with greater interest by the public; five large editions were sold in little more than a year, and the demand in America was as great as in England. These journals were regarded as a faithful record of the impressions made on the mind of a competent observer, at the time, by the events he witnessed and the persons with whom he associated. Their characteristic is the love of truth, of justice, and of sincerity. The court was irritated at the scornful disclosure of the vices and follies of former sovereigns, and fashionable society was annoyed at the writer's absolute indifference to its pretensions. But Greville did not stoop to collect or record private scandal. His object appears to have been to leave behind him some of the materials of history, by which the men and actions of his own time would be judged. He records not so much public events as the private causes which led to them; and perhaps no English memoir-writer has left behind him a more valuable contribution to the history of this century. Greville published anonymously, in 1845, a volume on the policy of England to Ireland, in which he advocated the payment of the Roman Catholic clergy; he was also the author of several pamphlets on the events of his day. [*Encyc. Brit.*, 9th ed.]

GREVILLE, Sir FULKE, Lord BROOKE, 1544—1628; an English poet, educated with his cousin, sir Philip Sidney. He traveled abroad and became acquainted with some continental languages. In 1620 he was made a peer. Eight years afterwards he was murdered by a servant who was so stricken with horror at the deed that he killed himself with the same sword. Among Greville's works are a biography of Sidney, a treatise on human learning, another of fame and honor, and one on war, besides poems.

GRÉVY, FRANÇOIS PAUL JULES, the president of the French republic, was b. Aug. 15, 1813, at Vandrez in the Jura, studied law, and became an advocate at Paris. He took part in the revolution of 1830, and in 1848 was returned to the constituent assembly. There he held an independent position, but was generally ranked with the extreme left. After Louis Napoleon's *coup d'état*, Grévy withdrew from politics and devoted himself to his professional work. He returned to political life in 1868. After the Franco-German war he was appointed president of the national assembly, a post he resigned in 1873; and after the general election of 1876 he again became president of the chamber. When in Jan., 1879, Marshal MacMahon resigned the presidency of the republic, Grévy, who is a thorough-going but not extreme republican, was by a large majority elected his successor. Grévy has never been a blind partisan, and he enjoys the respect and even the confidence of all parties.

GREW, MARY, b. Conn., 1813; daughter of Henry Grew, a Baptist clergyman; educated in Catherine E. Beecher's seminary in Hartford. In her youth, when New England was greatly agitated by the controversy between the old-school and new-school theology, she received a training in metaphysics which made her a skillful logician. In childhood she was deeply interested in the condition of the colored people, both free and slave, and was therefore prepared to adopt the fundamental principle of immediate emancipation of slaves as the duty of the master and the right of the slave. Her public addresses combined the skill of the trained logician with the warmth of womanly sympathy, and she was therefore highly popular as a speaker. She was not less skillful with the pen. As corresponding secretary of the Philadelphia female anti-slavery society, she wrote its annual reports for nearly or quite 30 years in succession, and so unique were they in their impressiveness that they excited a degree of public attention rarely awarded to such documents. At different times also, she was the editor of the *Pennsylvania Freeman*, the organ of the Pennsylvania anti-slavery society. She was educated a Baptist, but is now connected with the Unitarians, in whose pulpits she occasionally preaches. She is an earnest advocate of woman suffrage. She has resided in Philadelphia since 1834.

GREWIA, a genus of trees belonging to the natural order *tiliaceæ*, having simple and more or less ovate leaves, and a drupaceous fruit containing four 2-celled and 2-seeded nuts. They are African and Asiatic, mostly tropical and subtropical. Some species, as *G. sapida* and *G. Asiatica*, natives of the warmer parts of India, yield pleasant fruits, much used in the manufacture of sherbet. By the inhabitants of the Himalaya, the inner bark or bast of *G. oppositifolia* is used for the same purpose as that of the lime tree in Europe; and the leaves of *G. didyma* and other species are given as fodder to cattle, and dried and stacked for winter use. The wood of *G. didyma* is used for boats. That of *G. elastica* is much valued for purposes requiring strength and elasticity, as for making bows and the shafts of carriages.

GREY, a co. in n.w. Ontario, Canada, on Georgian bay; 1,800 sq.m.; pop. '71, 59,395. The land is good for all ordinary agricultural uses. Chief town, Owen Sound.

GREY, CHARLES, Earl, K.G., head of the government which carried the reform bill, was b. Mar. 13, 1764, at Fallowden, near Alnwick. The Greys are a Northumberland family of great antiquity, celebrated for military achievements, and first ennobled in the time of Edward IV. The first earl was sir C. Grey, K.B., a distinguished soldier, who held commands in the first American war, and in the war against the French republic.

His son was sent to Eton, and thence to Cambridge. He then visited the continent; and in his 22d year entered the house of commons as M.P. for his native county. He became a follower of Mr. Fox, and his maiden speech was in opposition to the address of thanks to the king for negotiating the commercial treaty with France. He soon obtained a leading position in the house of commons, and was one of the managers of the impeachment of Warren Hastings. He was also one of the founders of the society of friends of the people. In 1793 he was selected to present a petition from this society, in which the defects and abuses of the representative system were forcibly exposed. He was outvoted on this occasion, and again in 1797. In 1799 he opposed the proposal for the Irish union, but recommended the abolition of forty rotten boroughs in Ireland as a means of securing the independence of Irish members. When the whig administration of lord Grenville came into office in 1806, Grey, now lord Howick, became first lord of the admiralty. Mr. Fox died in Sept., and was succeeded by Grey as secretary of state for foreign affairs, and leader of the house of commons. The cabinet was broken up in 1807, but not before it had carried the abolition of the slave trade, and the enlistment of soldiers for a limited period instead of for life. It was unfortunate, both for Grey and the whigs, that he was, by the decease of his father in 1807, removed from the house of commons, where he might have led the opposition to the upper house, where his advocacy of measures of progress and amendment found little response. Grey and lord Grenville, as the leaders of the whig opposition, were more than once desired by the prince of Wales, after he became regent, to coalesce with the tory ministry, but these overtures were firmly rejected. Grey actively opposed the bill of pains and penalties against queen Caroline. During the long period in which he remained in opposition, from 1807 to 1830, he gave a strenuous support to the abolition of religious tests, the removal of Roman Catholic disabilities, and the amelioration of the criminal code. The year 1830 was a period of great political disorder and discontent. The French revolution had familiarized the bolder and more ardent spirits with the idea of resistance to the government. Nightly conflagrations in the agricultural districts alarmed the timid. When parliament met in Nov. Grey gave warning of the approaching hurricane, and again urged the adoption of measures of temperate reform. It was in answer to this speech that the duke of Wellington made his memorable declaration against reform, and expressed his admiration of the existing system of representation. This was the death-blow to the duke's government. Being outvoted on a motion of sir H. Parnell on the civil list, the cabinet resigned, and William IV. sent for Grey, who formed a whig government, of which he was of course premier. The whigs set to work in good earnest to clear away the gross abuses and nests of corruption which had accumulated during nearly seventy years of toryism; above all, a great comprehensive, and searching measure of parliamentary reform was prepared by a subcommittee of the cabinet, consisting of lord J. Russell, lord Durham, lord Duncannon, and sir J. Graham. The bill was brought into the house of commons, Mar. 1, 1831, by lord J. Russell, and electrified the nation. It was, however, fiercely opposed in both houses. General Gascoyne carried a resolution against reducing the number of M.P.'s. Grey thereupon advised the king to dissolve parliament. "The bill, the whole bill, and nothing but the bill," was the watchword at the elections; and when the new parliament met, the bill was carried through the lower house by large majorities. The second reading was moved by Grey in the house of lords, Oct. 3, 1831. After five nights the bill was thrown out by 199 votes against 158. The reply of the house of commons was an immediate vote of confidence in the ministers. The king prorogued parliament in order that after the shortest possible interval, the bill might be again introduced. Riots took place at Nottingham, Derby, and Bristol. At Birmingham 150,000 men threatened to march upon London. The metropolis was in a fever of excitement. A second reform bill passed the house of commons, which also passed a second reading in the house of lords, the tories being determined to mutilate it in committee. Lord Lyndhurst moved the postponement of the disfranchising clauses, and the whigs being beaten, Grey resorted to the extreme remedy of demanding from the king a new and large creation of peers. The king refused his consent, and Grey resigned. The popular excitement increased. The king sent for the duke of Wellington, but sir Robert Peel refusing to join the duke in the attempt to form a government, Grey again returned to office, armed with the power of creating as many peers as might be necessary to secure the safety of the bill. On June 4, 1832, the reform bill passed the house of lords, and Grey's friends crowded round him to congratulate him on having crowned his long, honorable, and consistent public career by a measure of such immense advantage and importance. Grey took office on the principles of peace, retrenchment, and reform. His government, however, lost a good deal of its popularity in England by his deference to the hostility of the lords, and his attempt to conciliate his opponents by a division of patronage. In Ireland Mr. Stanley's quarrels with Mr. O'Connell and the Irish repealers also tended to weaken the government. Many important measures were, however, passed—the measure for national education in Ireland, the Irish church temporalities bill, and the bill for abolishing slavery in the West Indies. In Dec., 1834, the Grey ministry fell to pieces on the Irish coercion act. Grey retired from the post of first lord of the treasury with the respect and esteem of the entire nation. A more honorable man never existed. A moral dignity stamped his every action, and over his

truthfulness no cloud ever passed. He passed the last ten years of his life in comparative retirement, and died at his family mansion, Howick house, July 17, 1845. His personal appearance was stately and dignified, his gestures were animated, and his tones lofty and sonorous. He left eight sons and four daughters to lament the loss of a most revered parent.

GREY, Sir GEORGE, K.C.B., governor and commander-in-chief of New Zealand, was b. at Lisburn, Ireland, in 1812. He was educated at the royal milltary college at Sandhurst, and on attaining his captaincy, offered to explore the interior of Australia, then but little known, and on receiving the requisite permission from the colonial office, started on his arduous mission in 1837. In Sept., 1838, he organized another expedition to explore the Swan River district. He returned to England in 1840, and began his *Journals of Two Expeditions of Discovery in North-western and Western Australia during* 1837–8–9. His enterprise and ability obtained for him, unasked, in 1841, from lord J. Russell, then colonial secretary, the post of governor of south Australia. In 1846 he was made governor of New Zealand. Both here and in Australia his first task was to acquire the language of the natives, with whom he became more popular than any preceding governor. His government appeared to the authorities at home to be so wise and conciliatory, that in 1848 he was made K. C. B. (civil), and in 1854 was appointed governor and commander-in-chief of the cape of Good Hope. The task of allaying the asperities and irritation left by the Kaffir war demanded high powers of statesmanship; Grey was, however, equal to the occasion. Industry revived, and brighter days began to dawn upon the colony. In 1858, however, the colonial office interfered with measures which he considered necessary, and he threw up his post, and came to England. Public opinion at the cape was so strongly manifested in his favor, that he was requested by the government to resume his governorship. On the breaking out of the Indian mutiny, Grey sent every soldier he could spare to the assistance of the Indian government, and received the acknowledgments of the British government and parliament for his promptitude and energy. In 1861 he was again appointed governor of New Zealand, in the hope that he would bring the war then raging there to a satisfactory conclusion. The natives received him with joy and veneration, and he succeeded in bringing about pacific relations with the Maories. He resigned his office and returned to England in 1867, but afterwards resided for a time in New Zealand, where he took a prominent part in resisting the absorption of the provincial powers by the central colonial government. Grey is the author of *Journals of Discovery in Australia* (1841); *Polynesian Mythology* (1855); and *Proverbial Sayings of the Ancestors of the New Zealand Race* (1858).

GREY, HENRY GEORGE, Earl, b. England, 1802; educated at Oxford, and under the title of lord Howick in 1826 a member of the house of commons. In his father's ministry formed in 1830 he was under secretary for the colonies, and afterwards for the home department. Under Melbourne he was secretary of war. After the death of his father in 1845 he took his place in the house of lords, as earl Grey. Under the Russell administration he was secretary for the colonies, retiring in 1852, in which year he published an *Essay on Parliamentary Government as to Reform.*

GREY, Lady JANE, an English lady of royal birth and singular misfortunes, was the eldest daughter of Henry Grey, marquis of Dorset, afterwards duke of Suffolk, and lady Frances Brandon. Lady Frances was the daughter of Charles Brandon, duke of Suffolk, and of Mary, sister of Henry VIII., who had been married to Louis XII., of France, but had become a widow. Lady Jane Grey was born at Broadgate, Leicestershire, in 1537. Having discovered, at an early age, surprising talents, she was furnished with an excellent tutor, Aylmer, afterwards bishop of London, and under his care, made extraordinary progress in arts and sciences, and particularly in languages, being able to speak and write Latin and Greek, as well as French and Italian. We have the testimony of Roger Ascham, that he found her reading the *Phædon* of Plato in Greek, while the rest of the family were engaged in hunting. She also sang and played well, and was versed in other feminine accomplishments.

In 1553, after the fall of Somerset, the dukes of Suffolk and Northumberland, now ruling in the name of the youthful king Edward VI., and foreseeing his speedy death, determined to change the succession to the crown, and secure it to their own families. Lady Jane Grey, now sixteen years old, was therefore married to lord Guilford Dudley, fourth son of the duke of Northumberland, in May, 1553. The king, failing in body, and weak in mind, and surrounded by selfish or fanatical advisers, was persuaded to make a deed of settlement, setting aside the right of succession of his sisters Mary and Elizabeth, and Mary Queen of Scots, leaving the crown to lady Jane, who was innocent of the conspiracy. After the king's death her ambitious relatives hailed her as "queen." Lady Jane at first shrunk from honor so treacherously won, but ultimately yielded to the force of their entreaties and commands, and allowed herself to be proclaimed. The people of England resented the unscrupulous conduct of Suffolk and Northumberland, and learned, brilliant, and amiable as lady Jane was, they rallied, with the true English instinct of loyalty, round Mary. Northumberland was defeated, sent to the tower, and beheaded Aug. 22, 1553; and in the following Nov. lady Jane and her husband were also condemned. For a while Mary hesitated to pronounce sentence of death against the young couple, but at length she issued the fatal warrant on Feb. 8, and, four days

after, both were executed. Lady Jane reigned only ten days. She met her fate with remarkable firmness, making a brief address, in which she confessed the justice of her sentence; but said: "I only consented to the thing I was forced into." Several epistles and other writings attributed to her are extant.

GREY FRIARS. See FRIAR.

GREYHOUND, a kind of dog distinguished by great slenderness of form, length of limbs, elongation of muzzle, swiftness, and power of endurance in running. There are varieties differing in other less important characters, but these are common to all. They have also prominent eyes and very keen sight, but their scent is not acute, and they pursue their prey not by the scent, like the hounds (q. v.) properly so called, but by keeping it in view. Some varieties, however, as the *Scottish greyhound,* probably from being crossed with the staghound or some other of the hounds, combine superior powers of scent with the ordinary qualities of the greyhound. Greyhounds have the parietal bones convergent, not parallel as in the hounds. The face exhibits an almost straight line from between the ears to the nose. The ears are small and sharp, half pendulous in the varieties best known in Britain, but quite erect in some of those of other countries. The chest is deep; the belly much contracted; the paws are small; the hair is long and rough in some varieties, short and smooth in others; the tail is long and slender, curved up at the tip, and in the common smooth-haired greyhounds of Britain and the w. of Europe, is covered with hair similar to that of the rest of the body; but there are other varieties with a bushy tail. It is probable that the greyhound originally belonged to some of the wide plains of central Asia, or to the n of Africa; it has been very long employed by man as a hunting-dog; it is figured in the monuments of ancient Egypt, and has been common from the earliest historic times in India, Persia, and other countries of Asia, as it has been also in Greece, and generally throughout Europe. To the western parts of Europe, however, there is every probability of its having been brought from the east; and old records show that a very high value was set upon it. It was long employed chiefly in the chase of deer; and on one occasion queen Elizabeth was entertained with the pleasant spectacle of "sixteen bucks, all having fayre lawe, pulled down with greyhounds," which she viewed from a turret at Cowdrey Park, in Sussex, the seat of lord Montacute. The right to possess greyhounds was a proof of gentility; and the effigy of this dog often appears at the feet of monumental figures of knights in armor. The killing of a greyhound in the good old times was a felony, punished as severely as murder.

The smooth-haired variety of greyhound, at present so common in Britain, and used for hare-hunting or "coursing," was imported from France, and improved by further importations from Greece, Italy, the n. of Africa, and India. The varieties previously in use were rough-haired, and some of them larger and stronger. The *Irish greyhound,* now almost if not altogether extinct, was large and powerful, so that whilst wolves existed in Ireland, it was used to hunt them. The *Italian greyhound,* is a very small and delicate variety, of gentle manners, well known as a drawing-room pet. Greyhounds do not, however, generally show the strong attachment to particular persons so common in other dogs; and although so long reduced to the service of man, are inferior to many other dogs in the degree of their domestication. Yet the Grecian and Turkish greyhounds have been trained to stop if a stick is thrown among them when in full pursuit of a doubling hare. A whole pack will thus be stopped, and then one, singled out, will pursue the game.

The fleetness of the greyhound is well illustrated by an anecdote, related in Daniel's *Rural Sports,* of a brace of greyhounds in Lincolnshire running after a hare a distance of upwards of four miles in twelve minutes—the increase of distance by turns not being reckoned—when the hare dropped dead.

Various etymologies of the name greyhound, have been proposed, than which none is more probable than that which refers it to the prevalence of a gray color in the breeds once most common. Another derivation is from *Graius,* Grecian. The *gazehound,* mentioned by old writers, is supposed to be the greyhound, the name being probably given when a pure breed, hunting by sight alone, began to be introduced.

GREYLOCK, a mountain near the village of South Adams, Berkshire co., Mass., 3,500 feet in height; the highest land in the state, commanding a remarkably fine view, overlooking the valley of the Hoosac and its villages on the n., beyond which are visible the peaks of the Green Mountains; a little to the e. 60 m. off are Mts. Monadnock and Wachusett; 40 m. s.e. are Holyoke and Tom; on the s. the Berkshire hills and Mt. Everett, and Pittsfield and its lakes and villages; s.w. far away across the Hudson are the Catskills. Near to Greylock are Saddle Ball and Saddle Mount.

GREYTOWN, SAN JUAN DE NICARAGUA, or SAN JUAN DEL NORTE, the chief seaport of Nicaragua at the mouth of the San Juan near the Caribbean sea; 10° 55′ n.; 83° 42′ w.; pop. about 1200. The harbor, if not neglected, would be one of the finest on the coast. The famous Nicaragua route for a ship-canal to the Pacific begins at Greytown. The place has considerable trade in India-rubber, hides, cocoa-nuts, rose-wood, etc.

GREYWACKE (Ger. *Grauwacke*), a partially translated German word, used as the name of an indurated argillaceous rock, common in, though not confined to, Silurian and Cambrian strata. The great bulk of the Silurian strata s. of Scotland is composed of this rock.

GRICES, in heraldry, are young wild boars.

GRIDLEY, JEREMY, 1702–67; b. Boston; educated at Harvard, and was for a short time editor of a newspaper called the *Weekly Rehearsal*. He was eminent as a lawyer, and became attorney-general for the province.

GRIDLEY, RICHARD, 1711–96; b. Boston. He was in the engineer service at the siege of Louisburg, was in the Crown Point expedition in 1756, and erected the works at lake George. He served under Amherst and Wolfe, and when the revolution began he directed the construction of the works on Breed's hill the night previous to the Bunker hill battle. He rose to the rank of maj.gen.

GRIERSON, BENJAMIN H., b. Penn. 1837. In the war of the rebellion he rose from maj. to maj.gen. of volunteers, and was especially famous as a leader of dashing and hazardous cavalry expeditions or raids. After the war he was appointed col. of cavalry in the regular army.

GRIESBACH, JOHANN JAKOB, author of the first critical edition of the New Testament, was b. at Butzbach, in Hesse-Darmstadt, Jan 4, 1745. While Griesbach was still a child, his father was called to St. Peter's church, in Frankfort-on-the-Main, where he was also made consistorial counselor. Griesbach accordingly received his first education at the gymnasium of that city, and afterwards studied theology at Tübingen, where the old dogmatic was still predominant; at Halle, where Semler influenced his whole after-life; and at Leipsic, where he became acquainted with Ernesti. Having resolved to devote himself specially to the criticism of the New Testament text, which had become a favorite study among theologians, Griesbach undertook a journey to various libraries of Germany and Holland, to London, Oxford, Cambridge, and Paris. On his return he published his *De Codicibus Evangeliorum Origenianis* (1771), and commenced lecturing as *privat-docent* in Halle. In 1773 he was made extraordinary professor; but in 1776 was called as ordinary professor to Jena, where he continued to teach with great success, and in the enjoyment of many honors, till his death on Mar. 24, 1812. The great work with which his name is associated is his critical revision of the New Testament text. Besides pointing out new sources for the discovery of the original reading, attempting a history of the sacred text (*Curæ in Historiam Textus Epp. Paul.*, 1777), and laying down more certain laws of criticism (*Symbolæ Criticæ ad Supplendas et Corrigendas Varias Lectiones N. Test.*, 2 vols., 1785–93), Griesbach was the first who dared to print the New Testament text, as he had been enabled to determine it by his critical science. The first specimen of the revised text that he published was the *Synopsis Evangeliorum* (2 vols. 1774–75; 2d ed. 1809). This was followed, in 1775–77, by an edition of the whole New Testament, which was published again in 1796–1806, and of which a re-issue was begun by D. Schulz in 1827, but has never been completed. The second edition has been twice reprinted in London, first in 1809, and again in 1818; an American edition was published at Boston in 1808. Besides smaller editions, a splendid one in 4to was published by Göschen at Leipsic in 1803–7. Griesbach's other works, *Populäre Dogmatik* (1779; 4th ed., 1789), *Commentarius Criticus in Textum N. Test.* (2 vols., 1798–1811), and the *Opuscula Academica* (2 vols., 1824–25, edited by Gabler), are now less known. A very competent authority, viz., the eminent Dr. Marsh, has pronounced Griesbach to be "the most consummate critic that ever undertook an edition of the New Testament." The grand feature of Griesbach's critical system is his threefold division or classification of the New Testament MSS. These divisions he called "recensions," or "codices." They consisted of—1. The Alexandrine recension; 2. The Latin or western recension; 3. The Byzantine or eastern recension. Griesbach endeavors to show that the early fathers, according to their locality, made use of a particular set of MSS., exhibiting certain peculiarities such as justify the above division. Griesbach expressed his decided preference for the Alexandrine recension, both in regard to antiquity and purity; the Byzantine he considered the least trustworthy. Among the most memorable of Griesbach's triumphs as a critic is his exposure of the interpolation of the well-known passage in defense of the doctrine of the Trinity, 1 John v. 7. His life has been written by Köthe (Jena, 1812); Augusti (Berl. 1812); and by Eichstädt (Jena, 1815).

GRIFFIN (Fr. *Griffon*, Lat. and Gr. *Gryps*), a chimerical creature, which the fancy of the modern has adopted from that of the ancient world. The griffin is first mentioned by Aristeas, perhaps about 560 B.C. (see Liddel and Scott's *Gr. Dic.*), though the accounts of Aristeas seem to be about as fabulous as those of the griffin. See Smith's *Dic. of Gr. and Rom. Biog.* The origin of those monstrous conceptions in general, of which the griffin is one, has already been considered under DRAGON (q.v.). The griffin is variously described and represented, but the shape in which it most frequently appears is that of an animal generated between a lion and an eagle, having the body and legs of the former, with the beak and wings of the latter. In this form it appears on antique coins, and as an ornament in classical architecture. Like all other monsters,

griffins abound in the legendary tales of the Teutonic nations, and the name in various forms, slightly differing from each other (Ger. *Greif*, Dan. *Grif*. etc.), is to be found in most Teutonic dialects. Whether in the two cases both the name and the notion might not be traceable to a common source, or whether it was through barbarian or classical channels that they found their way into the nomenclature and the practice of heralds, are subjects on which we do not venture an opinion. Certain it is, however, that there are few fabulous conceptions with which the science of heraldry is more conversant than the griffin. Nor were they regarded by the patriarchs of that science always as mere creatures of the imagination, for incredible as it may seem, we find Gerard Leigh, a herald of great reputation in the time of Elizabeth, talking of them with entire sincerity as existing animals. "I think they are of great hugeness," he says, "for *I have a claw of one of their paws*, which should show them to be as big as two lions."—See Newton's *Display of Heraldry*, p. 126. In the heraldic griffin, the claws of the eagle are usually substituted for the fore-paws of the lion. Gwillim blazons a griffin in this attitude "rampant," alleging that any fierce animal may be so blazoned as well as a lion. But the more appropriate and usual term is "segreant." In representing the griffin, the ears ought not to be omitted, as they indicate the attribute of watchfulness, which, along with strength and swiftness, went to make up the classical conception of his character. See WYVERN.

The name GRIFFIN, in natural history, is sometimes appropriated, as by Cuvier, to the genus *gypaëtos*, of which the lämmergeier (q.v.) is the best known species; whilst in France it is generally bestowed, under the slightly modified form *griffon*, on the TAWNY VULTURE (*vultur* or *gyps fulvus*), also called the griffin vulture or griffon vulture, a bird which inhabits most of the high mountainous regions of Europe, as well as those of northern and central Asia and of the n. of Africa. A specimen was caught in the s. of Ireland in 1843, the only one that is known to have ever found its own way to the British islands. The griffin vulture is more than 4 ft. in length; it is of a yellowish-brown color, with darker quills and tail; the head and upper part of the neck covered with short white down, the lower part of the neck surrounded with a ruff of long slender white down. Its habits are very much those common to vultures in general.

GRIFFIN, CHARLES, b. Ohio, 1826; graduated at West Point; served in the Mexican army and on frontier duty. He became a capt. in 1861, and was at the first battle of Bull Run; rose through various grades to brevet maj.gen. of volunteers, and after the war was appointed col. of the 35th infantry in the regular army. He was one of the commissioners to carry out the terms of Lee's surrender, being at that time in command of the 5th corps.

GRIFFIN, CYRUS, 1749–1810; b. Va.; was in the legislature, and in the colonial congress two terms, presiding over that body in 1788. From 1789 he was judge of the United States district court for Virginia.

GRIFFIN, EDWARD DORR, D.D., 1770–1837; b. Conn.; graduated at Yale, and was pastor of a Congregational church in 1795; afterwards pastor in New Jersey; in 1808 professor of sacred rhetoric at Andover, and in 1811 pastor in Boston, where he published the *Park Street Lectures*, an exposition of the doctrines taught by John Calvin. In 1821 he was chosen president of Williams college, where he remained until 1836. He published a number of works.

GRIFFIN, GERALD JOSEPH, 1803–40; b. Ireland; at the age of 20 went to London to undertake a literary career, taking along a play for which he found no market. He then sent prose articles and poems to the newspapers and magazines, and soon began to be favorably known as a promising author. Among his works are *Tales of Munster Festivals; The Colleen Bawn; The Invasion; The Duke of Monmouth; The Rivals;* and many poems.

GRIFFIS, WILLIAM ELLIOT, b. Philadelphia, 1843; a clergyman of the Reformed church, a traveler and educator in Japan. When 22 years of age he turned from business life and entered Rutgers college, graduating 1869. After traveling in Europe he studied one year at the theological seminary at New Brunswick, N. J.; then accepted appointment to organize schools on the American model in Japan, and was the first American teacher in regions beyond the open ports. On the fall of the feudal system, and the unification of the empire, he was appointed professor of the physical sciences in the imperial university of Tokio. He prepared the *New Japan Series* of reading and spelling books and primers for Japanese students of the English language, and contributed to the Japanese press and to newspapers and magazines in the United States numerous papers of importance on Japanese affairs. Returning to New York, 1874, he finished his theological studies at the Union theological seminary; and, in 1877, became pastor of the Reformed church, Schenectady, N. Y. He is the author of *The Mikado's Empire;* also of a collection of the fairy tales and folk lore of the Japanese, and of a *History of Corea.*

GRIFFITH, WILLIAM, 1810–45; b. England; educated at London university; and was assistant surgeon in India. He took much interest in botanical studies, and made large and valuable collections of plants. His name has been attached to a genus of rubiaceous plants.

GRIGORIO'POL, a t. of South Russia, in the government of Kherson, on the left bank of the Dniester, 78 m. n.w. from Odessa. It is a fortified town, and regularly built, is inhabited chiefly by Armenians, and has manufactures of silk and cotton stuffs. Its Armenian inhabitants have received large grants of land in the vicinity, but neglect its cultivation, and are chiefly occupied in commercial pursuits. Pop. '67, 6,608.

GRILLPARZER, FRANZ, an Austrian dramatic poet, was b. at Vienna, Jan. 15, 1790, and first attracted the notice of the public in 1816 by a tragedy, entitled *Die Ahnfrau* (The Grandmother). In 1819 appeared *Sappho*, and in 1822 *Das Goldene Vliesz* (The Golden Fleece), which, although they had not much success on the stage, were highly admired as literary productions. The most important of his subsequent works are *König Ottokar's Glück und Ende* (King Ottokar's Fortune and End, 1825), a tragedy regarded by some as in many respects his most masterly piece; *Melusina* (Vienna, 1833); *Des Meeres und der Liebe Wellen* (The Waves of Love and of the Sea, 1840), founded on the story of Hero and Leander, and remarkable not only for its particular beauties, but also for the unusual delicacy and simplicity of spirit characterizing it as a whole; and *Der Traum im Leben* (The Dream of Life, 1840), a richly poetical drama. Grillparzer also wrote some comedies, and several very beautiful lyric poems, which betray a half-suppressed but genuine love of liberty. He died in Jan., 1872.

GRILSE. See SALMON.

GRIMALDI, an ancient and noble family of Genoa, who were princes of Monaco from the 10th to the 17th century. The most eminent of the Grimaldis were: 1. RANIERD, who commanded a fleet in the service of Philip the fair (of France) in 1304, defeating and making prisoner Guy of Flanders. 2. ANTONIO, distinguished in naval warfare in the early part of the 14th century. He was successful over the Aragonese and Catalonians until 1353, when they nearly destroyed his fleet. 3. GIOVANNI, another naval commander, who defeated Trevesani, the Venetian admiral on the Po, taking 28 galleys, a whole fleet of transports, and much other spoil. 4. DOMENICO, like the others distinguished at sea, especially in the battle of Lepanto. He was also a cardinal and vice-legate of the Avignon, noted for his efforts to exterminate heresy. 5. GERONIMO, 1579–1685; was a cardinal, and made great efforts to reform the manners of the clergy. He founded a hospital for the poor, and distributed in alms 100,000 livres a year.

GRIMES, a co. in e. central Texas on the Navosota and Brazos rivers, reached by the Houston and Texas Central railroad; 902 sq.m.; pop. '70, 13,218—7,921 colored. It is mostly level, and a large portion is covered by forests. Soil good. Chief productions: cotton, corn, cattle, and pork. Co. seat, Anderson.

GRIMES, JAMES WILSON, LL.D., 1816–72; b. N. H., graduated at Dartmouth, and followed the legal profession. He settled in Iowa, was in the territorial and state legislature, and in 1854 was elected governor. In 1859 he was U. S. senator, being re-elected in 1865. At the beginning of the war of the rebellion he was the originator of the first act of emancipation by inducing the president to set free a number of fugitive slaves who had been put in jail in Washington.

GRIMKÉ, ANGELINA, 1805–79; b. Charleston, S. C.; an American abolitionist, youngest daughter of judge Grimké, and sister of Thomas S. Grimké, the distinguished opponent of nullification in 1830–31. Belonging to a family of the highest social rank, and born in one of the strongholds of slavery, she saw in her earliest childhood the cruel wrongfulness of the system; and in the earliest years of ripening womanhood, with all the charm that beauty, intelligence, and family distinction could give, she tore herself from home and friendships and became an exile among strangers, in order that she might more effectually plead the cause of the slaves. As a child she was shocked by the cruelties to which the slaves were exposed, and she would sometimes steal out of the house in the darkness, with her bottle of oil and other simple medicaments, and do what she could to alleviate the sufferings of some poor creature who had been terribly whipped. At an early age she united with the Presbyterian church, and her religious experiences served to intensify her hostility to slavery. Every effort was made to overcome what were regarded as merely her childish and fanatical scruples. When she was 16 years of age her mother gave her a slave girl to be her waiting-maid. "You are to have her as your property," said the mother. But Angelina said firmly, "I cannot have a slave. The girl belongs to herself, not to me. Besides, I don't need to be waited on; I can wait on myself." No persuasion could induce her to become a slaveholder. As a teacher in a Sunday-school, she could not fail to see the contrast between the privileges of instruction enjoyed by her pupils and the deprivations of the slaves, whom she could not even teach to spell the name of God without breaking the law. Finding that moral instruction was not prohibited, she besought her mother for permission to call the slaves of the household every morning for social worship. When they were assembled the young girl read to them the words of Christ, spoke to them tenderly of the simple truths of the gospel, and then knelt and prayed with them. Such was her daily practice so long as she remained under the paternal roof. She endeavored to impress upon the officers of the church a sense of what they should do for the slaves, but her pleadings found no response. Through an elder sister in Philadelphia she heard of the Quakers and their opposition to slavery. She read their books and was charmed, and finding that there

were in Charleston two aged Friends who met every Sunday for worship, she discarded her fashionable attire, put on the simple Quaker garb, and for a whole year afterwards, when the family carriage rolled away on Sunday morning to St. Philip's, walked alone to the Friends' meeting-house, and sat down with these two aged Friends under a canopy of silence, where no word was ever spoken. This was while there was yet no public movement against slavery; she was following her own heartfelt convictions and longing for further light. News of Garrison's imprisonment in Baltimore reached her, carrying with it, however, a weight of opprobrium upon his name. What could she do? She was convinced that it was impossible for one in the midst of slavery to act effectually against it. Self-exile seemed the only alternative. The thought of this brought peace. Her sister in Philadelphia had united with the Quakers; she would join her and find in the free north her home and her work. In the fall of 1830 she left all, never to return. The rising anti-slavery movement at once enlisted her sympathy, but how to give it any help she did not at first see. At length light dawned upon her, and she was impelled to prepare an *Appeal to Christian Women of the South*. She timidly submitted the manuscript to the executive committee of the American anti-slavery society, by whom it was read with wet eyes. It was published and sent in large quantities to the south. In Charleston it created a strong excitement, and, with other publications of the same character, formed a pretext for breaking open the post-office and making a bonfire in the public square. Not long after this it was understood in Charleston, that she intended to visit her mother and sister and pass the winter with them. Thereupon the mayor called upon her mother, and desired her to inform her daughter that the police had been instructed to prevent her landing, and that, if she should elude their vigilance, and go ashore, she would be arrested and imprisoned. When these threats were communicated to her, she replied that she knew she could not go to Charleston without compromising and distressing her family, but, were it not for this fact, she would certainly exercise her constitutional right as an American citizen to visit her relatives, submitting willingly to any pains and penalties that might be inflicted upon her, believing as she did that any violence she might be called upon to suffer would serve to reveal the true nature of slavery and intensify the opposition to it in the free states. Remaining in Philadelphia, and acting in co-operation with her sister, she was exerting a strong private social influence in favor of the anti-slavery cause. As yet she had not lifted up her voice in public, nor addressed any private assembly of women, nor in any other way transcended the conventional rules by which the activity of women was limited. But now came an invitation to her from the American anti-slavery society to go to New York for the purpose of meeting women in private parlors and laying before them her experiences as a southern woman, and pleading with them to lend their influence for the overthrow of slavery. She said, "I feel this to be God's call," and resolved at once to obey it. Her sister, Sarah Moore Grimké, 13 years older than herself, who was in full sympathy with her in her opposition to slavery, concluded to join her, and together they went to New York in Nov., 1836. The society had offered them a modest salary, which they declined, preferring to labor at their own cost. Their visit made no small stir in a city already much excited upon the slavery question. Many private parlors were opened to them and crowded by women eager to listen and to learn. Their addresses made a profound impression upon all who heard them. Angelina especially disclosed remarkable power as a speaker, and the traditions of her eloquence have survived the overthrow of slavery. Parlors becoming too small for the crowds that desired to attend, vestries and halls were substituted, and at last it was found necessary to open a large church, which in turn overflowed with the multitudes of women who thronged to see and hear. The fame of the sisters was widespread, and in 1837 they were called to Massachusetts, where for a time they continued to speak to women only; but so exciting were the reports of Angelina's eloquence that at length the barriers were broken down and men as well as women thronged their meetings. The lady speakers were by no means displeased on this account, for as Quakers they were as willing to address the one sex as the other. The excitement which had attended their labors was now mightily increased, a strong opposition to their course was developed, the "woman question" was discussed on every side, dividing the abolitionists into two hostile camps, and for a time Massachusetts, and indeed all New England, was deeply agitated. Here began the modern movement for enlarging the sphere of woman's opportunities and activities which has borne so many fruits already and is still an absorbing theme of discussion. The South Carolina ladies welcomed the discussion, but did not suffer themselves to be drawn aside from their special work. Angelina especially was in wide demand. Night after night she spoke to crowds that filled the old Boston theater to its utmost capacity. Her audiences were composed of people of intelligence and culture, and her thrilling appeals did much to modify the prevailing pro-slavery sentiment of the times. A committee of the Massachusetts legislature invited her to address them in the hall of representatives, where she was heard with close attention and deep respect by eminent citizens from every part of the state. In all these labors, according to the testimony of those who witnessed them, she never lost one of her purely feminine qualities. Graceful, gentle, retiring, she won universal respect and admiration. In May, 1838, she was married to Theodore D. Weld. It was far from her expectation that her public labors were now ended; but early in her married life she was twice severely injured, and thereby incapacitated

for further public speaking. Her husband founded a school, to which for many years she gave her attention as her health permitted. Her sister went with her into retirement, and was also engaged in Mr. Weld's school. They still maintained their interest in the anti-slavery cause, and both of them lived to rejoice in its complete triumph. Sarah died at Hyde Park, Mass., 1873; Angelina, 1879.

GRIMKÉ, FREDERICK, 1791–1863; brother of Thomas, b. S .C. He settled in Ohio, where he was for a long time judge of common pleas and of the supreme court. He published *The Nature and Tendency of Free Institutions*, and an essay *On Ancient and Modern Literature*.

GRIMKÉ, THOMAS SMITH, LL.D, 1786–1834; b. S. C., graduated at Yale, and studied law. He was active in political life, and vigorously opposed South Carolina's nullification projects. He was a thorough scholar, and the author of a number of addresses on science, education, and literature. He was one of the early advocates of peace and a promoter of the American peace society. One of his hobbies was a reform in the spelling of the English language, but he was too far ahead of the age to get a hearing.

GRIMM, FREDERICH MELCHIOR, Baron, an eminent critic of the last c., who, during his long residence in Paris, was on terms of intimacy with the most celebrated personages of the day, was b. at Regensburg, Dec. 25, 1723. Having completed his studies, he accompanied the young count de Schönberg to the university at Leipsic, and afterwards to Paris. Here he became reader to the crown-prince of Saxe-Gotha, but the situation proved more honorable than remunerative, and Grimm was in very straitened circumstances when he became acquainted with Rousseau. The latter introduced him to Diderot, baron Holbach, Madame d'Epinay, and other persons distinguished by birth and talents, and he soon became a general favorite. His connection with the encyclopædists (q.v.), and his multifarious acquirements and versatility of mind soon opened to him a brilliant career. He became secretary to the duke of Orleans, and now began to write his literary bulletins for several German princes, containing the ablest analysis of all the most important French works. In the composition of these notices, he is believed to have been assisted by the Abbé Raynal and Diderot. In 1776 he was raised by the duke of Gotha to the rank of baron, and appointed minister-plenipotentiary at the French court. On the breaking out of the revolution, he withdrew to Gotha, and in 1795 the empress of Russia appointed him her minister-plenipotentiary at Hamburg, a post which he retained till ill-health obliged him to relinquish it. He returned to Gotha, where he died Dec. 19, 1807. His *Correspondance Littéraire, Philosophique et Critique*, was published after his death in 16 vols. A supplement to this is the *Correspondance inédite de Grimm et Diderot* (Paris, 1829). It contains a complete history of French literature from 1753 to 1790, and is remarkable for its brilliant and piquant criticism.

GRIMM, JAKOB LUDWIG, German philologist and antiquary, was b. Jan. 4, 1785, at Hanau, in Hesse Cassel. He was educated in classical and legal studies at Marburg, and afterwarwards visited Paris, where he pursued a variety of studies, and assiduously cultivated his taste for mediæval literature. On his return to Germany he was appointed secretary to the minister of war at Hesse Cassel, and became successively librarian of Willelmshöhe, and auditor to the council of state. In 1814 he was secretary to the ambassador of the elector of Hesse, whom he attended at Paris, and at the congress of Vienna. In 1815 he was appointed a commissioner by the Prussian government to claim the restoration of valuable manuscripts, which had been removed to Paris by the armies of Napoleon I. In 1830 he received the appointment of professor of German literature, and librarian of the university of Göttingen. In this position he devoted seven years to the study of the language, ancient laws, history, and literature of Germany. He was one of seven professors who protested in 1837 against the abolition of the constitution by the king of Hanover, for which act he was outlawed, and obliged to retire to Cassel. In 1841 he was invited to Berlin, where as a member of the academy he was entitled to give lectures. He sat as a member of the assembly of Frankfort in 1848. Though holding at various times important public offices, his life was devoted to philological and antiquarian studies, and to works which are mines of erudition, and the results of a wonderful industry combined with excessive enthusiasm for everything German. His German *Grammar*, in four volumes, the first volume of which was published in 1819, and the last in 1837, is perhaps the greatest philological work of the age; it may be said to have laid the foundation of the *historical* investigation of language. It traces the German language through all its dialects. Some idea of its thoroughness may be got from the fact that the vowels and consonants alone occupy 600 pages. His *Deutsche Rechts-Alterthümer* (antiquities of German law published 1828), and *Deutsche Mythologie* (German Mythology, 1835), are exhaustive works upon the society of the middle ages in central Europe, and the religious traditions and superstitions from the earliest times. His *Geschichte der Deutschen Sprache* (History of German Language), and *Ueber den Ursprung der Sprache* (On the Origin of Language), are also works of great importance. In company with his brother Wilhelm he published numerous works of a more popular character, the best known of which is *Kinder und Hausmärchen* (Nursery and Fireside Stories). The greatest joint undertaking of

the two brothers (now carried on by other scholars) is the *Deutsches Wörterbuch*, begun in 1852, and yet far from completion. Jakob Grimm died Sept., 1863.

GRIMM, WILHELM KARL, brother of the preceding, was b. at Hanau, Feb. 24, 1786. He was the companion of his elder brother at the lyceum of Cassel, and the university of Marburg. In 1814 he was secretary of the librarian of Cassel, and on removing to Göttingen, in 1830, was appointed under-librarian and supernumerary professor of philosophy. He joined his brother in the protest against the king of Hanover, shared his exile, and also his call to Berlin. They labored together, and were commonly known as the Brothers Grimm. Wilhelm Grimm died Dec., 1859. Among the works of the younger Grimm are—*Translations of Ancient Danish Heroic Poems of the Sixth Century; German Runic Characters; Heroic Legends of Germany*, etc.

GRI'MMA, a small t. of Saxony, in the circle of Leipsic, and 18 m. s.e. of the t. of that name, is attractively situated in a hollow on the left bank of the Mulde. In the middle ages its importance as a trading town was much greater than at present, and the flourishing manufactures in cloth, flannels, hosiery, cottons, and linens, for which at an early period of its history this town was noted, have now almost entirely disappeared. Among the public buildings are the royal castle, now used as a court-house, and the ancient town-hall. Pop. '75, 7,273, who support themselves by manufactures and agriculture.

GRIMM'S LAW, the name—derived from the discoverer, J. Grimm (q.v.)—given to the principle which regulates the interchange of the mute consonants in the corresponding words of the different Aryan languages. A historical survey of this family of tongues shows the consonants to go through a cycle of changes (Ger. *Lautverschiebung*). What, for example, was a *p* in the original form of a word, or, at least, in the oldest form known, is found at a later stage transformed into *f*, which next passes into *b;* and this again tends to become *p*, and go through the cycle anew. The following table exhibits the transitions that manifest themselves in regard to the Greek, Gothic, and old high German:

	Labials.			Dentals.			Gutturals.		
Greek (Latin, Sanscrit),..	p	b	f	t	d	th	k	g	ch
Gothic,.....	f	p	b	th	t	d		k	g
Old High German,.....	b (v)	f	p	d	z	t	g	ch	k

There are of course many exceptions, arising from the influence of adjoining letters and other accidental causes. The following are exambles of the law:

Sanscrit.	Greek.	Latin.	Gothic.	Old High. German.
pâda-s	pod-os	pedis	fôtus	vuoz
pitrî	pater	pater	fadrein (pl.)	vatar
bhri	phero	fero	baira	piru
tvam	tu	tu	thu	du
trayas	treis	tres	threis	drî
paçu	poû	pecus	faihu	vihu

It is in the high German dialects that the action of this principle is most marked. In the Teutonic tongues of the "low" type, of which English is one, the consonants have remained at the same stage of development they had attained in the Gothic (e.g. Eng. *father, foot, bear, three*); the old high German exhibits a third stage; and in modern high German the principle seems still at work, although its development is hindered by the crystallizing effect of written language.

GRI'MSBY, GREAT, a parliamentary and municipal borough, seaport, and market-town of England, in the co. of Lincoln, is situated on the right bank of the Humber, 40 m. n.e. of the t. of Lincoln. It consists of two portions—the older, comprising a number of streets irregularly laid out, it is at the head of the harbor; and the newer part, called the "Marsh," extends along the e. side of the harbor, and is regular and spacious. The parish church, a good specimen of the English pointed style, is an elegant cruciform structure, with a tower containing eight bells rising from the center. Among its institutions Grimsby has a free grammar-school, a national school, and other educational establishments; a mechanics' institute and a new town-hall. There are here an extensive and commodious suite of docks, opened in Mar., 1852, and spacious enough to receive the largest ships of war; several ship-building yards, mills, and a tanyard and brewery. Grimsby, however, is now chiefly famous for its immense fishing trade. In 1875, 2,543 vessels, of 438,520 tons, entered, and 2,071, of 508,898 tons, cleared the port. The commerce of Grimsby is benefited by its being the terminus of the Great Northern, and of the Manchester, Sheffield, and Lincolnshire railways. It sends one member to the house of commons. Pop. in '71, of the municipal borough, 20,244; of the parliamentary borough, 26,982.

Grimsby was formerly a port of such importance that, in the reign of Edward III., it sent 11 ships to aid that monarch in his expedition against Calais. But the gradual silting up of the harbor reduced it to comparative insignificance. Its present prosperity may be said to date from the beginning of this century, when measures were first taken to improve the harbor.

GRINDAL, EDMUND, 1519–83; an English prelate, private chaplain to bishop Ridley, and chaplain to king Edward VI. When Mary came into power he went to the continent and remained until her death. On returning he was one of the makers of a new liturgy, and one of seven ministers chosen to oppose the Roman Catholics in open discussion. He was bishop of London, succeeding Bonner, and afterwards bishop of York. In 1575 he was made archbishop of Canterbury. He became blind in 1582.

GRIN'DELWALD, one of the most beautiful of the high Alpine valleys, at a distance of 35 m. from the city of Bern, is about 12 m. long and 4 m. broad. Grindelwald owes its celebrity as a resort for travelers to two great glaciers, branches or arms, as it were, of the immense ocean of ice which covers the Bernese Oberland. The village of Grindelwald, consisting of a number of widely-scattered cottages, with about 3,500 inhabitants, is about 3,600 ft. above sea-level.

GRINDING, the operation of shaping any hard substance by rubbing away its surface with a rough stone or with a cutting powder. It is similar to filing, and is used in cases where, from the hardness of the material, or for other reasons, filing is inapplicable. Thus cutting-tools and other steel instruments may be filed before hardening and tempering; but after this, if further abrasion is required, they must be ground. Glass lenses and metal specula are ground to shape with emery-powder laid upon a metal tool. Ornamental glass is ground into facets or otherwise by means of stones and lap-wheels. Diamonds and other gems are ground or cut with diamond-dust imbedded in soft iron. When large flat surfaces are required, they are obtained by first working two pieces of the substance nearly flat, and then laying one upon the other, and grinding their surfaces together with sand, emery, or other suitable cutting powder. Plate-glass is flattened in this manner; also surfaces of cast-iron where accurate fitting is required, the iron surface being either prepared with a planing-machine, or by turning in a lathe with a slide-rest. Sockets and other bearings which require to be fitted with great accuracy are usually finished by grinding together. For brass and bell metal powdered pumice-stone is best adapted for such purposes, as emery is liable to imbed itself in the metal, and give it a permanent cutting action upon the bearings.

Dry grinding is the term applied to the grinding of steel with dry grindstones. Its principal applications are in the grinding of the points of needles and forks, the surfaces of gun-barrels, and in finishing steel-pens. This kind of work produces painful irritation in the throat and nostrils of the men and women who follow it; and although the distressing effects have been very much diminished of late by the introduction of currents of air to carry away the particles of steel, and mouth-pieces of damp cloth, the evil is not entirely obviated; in some branches, such as gun-barrel grinding, it is still very great. Besides this evil, the stones used for gun-barrel grinding, which are very large, revolve with great rapidity, and occasionally break with great force while revolving, and seriously endanger the lives of the men.

Another kind of grinding, quite distinct from the above, is that of crushing and rubbing a substance into a fine powder. This is effected by passing the substance between rough stones, as in the common flour-mill, or between rollers, either smooth or toothed, according to the degree of fineness required, or by a heavy stone or iron cylinder revolving upon a smooth plate. Colors are ground in small quantities with a *muller and slab*. The muller is a heavy piece of stone of somewhat conical shape, and which rests on its base upon the slab of stone, and is grasped by the hands, and the color is mixed to a pasty consistence with the required medium of oil or water, and rubbed between the two surfaces until smooth and impalpable. On a larger scale iron or stone cylinders revolve on a slab in such a manner that they shall not merely roll but shall also rub upon the surface of the slab. A knife or scoop follows one cylinder and precedes the other, scooping the paste into the position required to come fairly under the cylinder which follows it. Chocolate, spices, plumbago for crucibles, and a variety of other substances, are ground in this manner.

GRINDING AND CRUSHING MACHINERY. Most of the improvements in grinding and crushing machines have been made within the last 30 years, particularly as relates to crushing and breaking. Until the development of the gold fields of California subsequent to the year 1849, in which was the commencement of the great migration thither, the breaking of stones and ore was performed usually by hand, with a sledge, in connection with blasting. The first machine on the Pacific coast consisted of immense weights, raised by cams to a height of 4 or 5 ft., and let fall upon the rock. A machine having a weight of one ton had a capacity of breaking one ton of quartz rock an hour. There was no mortar or trough, but the rock was placed on the face of an anvil, around which there was a grating through which fell all the pieces broken sufficiently fine. Coarser pieces could be replaced upon the anvil. A machine more easily worked, and very effective, was invented by Mr. Eli Whitney Blake, of New Haven, Conn. A very heavy, stationary, vertical plate forms one side of a wedge-shaped hopper, which is at the same time the crushing chamber. The other side of the hopper is formed by a movable jaw which turns upon a pivot at the upper end, the lower end coming as near the stationary piece as the required size of the fragments. This jaw is moved backwards and forwards through the space of about one quarter of an inch, by means of a toggle joint which is moved by a wheel. A rubber spring aids in draw-

ing the jaws apart suddenly, thus facilitating the descent of the rocks in the wedge-shaped hopper. The product of crushed matter varies with the different sizes from 3 to 7 cubic yards per hour, the horse-power varying from 4 to 12. Hall's breaker is a modification of Blake's, the movable jaw consisting of two pieces which play alternately. For further notice of rock-crushing machinery, see METALLURGY, and for sugar-cane crushing-machines, see SUGAR. In the article MILL there is a description of grind-stones and machinery for making flour. There are various other forms of mills for other purposes, such as the crushing of seeds and bark, and grinding of paints. Very powerful mills are required in the preparation of vulcanized India-rubber (caoutchouc). The crude India-rubber, after being boiled and softened in a steam vat, is passed between two fluted rollers of very great strength, by which it is ground to a sort of paste. A kind of mill used for crushing seeds, grinding chocolate, mixing mortar, etc., consists of two vertical wheels turning independently upon the ends of an axle, which also turns upon a vertical pivot midway between the two wheels. A circular bed or vat, having a rim of greater or less height, receives the article to be ground, over which the wheels or rollers are made to revolve. One of the most ingenious, simple, and effective mills in use was the invention of Mr. James Bogardus, of New York city. Two wheels, having on their faces concentric grooves, have different axes of revolution, being eccentric, a name given to the mill. The wheels are placed horizontally, and the lower one is turned by a shaft at the rate of from 600 to 800 revolutions per minute. The upper wheel also takes on a motion from the impulse of material brought against it, but being eccentric, the material is brought diagonally against the edges of the groove, making the grinding very effective and preventing clogging. Over 200 barrels of sugar have been ground per hour in a 16-in. mill. It will grind 5 tons of oil-cake, half a ton of bark, two tons of white lead in oil, four tons of iron-ore, and two tons of any ores per hour. It is very strong and not easily disordered.

GRINDSTONES. Flat circular stones made to revolve upon an axis, and used for grinding steel, glass, other stones, etc. They are made of sandstone, or sandstone grit, of various degrees of coarseness, according to the purpose for which they are to be used.

GRINDSTONES (*ante*) are mounted more or less simply, from the stone disk fixed on a horizontal spindle carried on the tops of two posts rudely set in the ground, with a winch handle, or crank and treadle, to the large stones employed in cutlery manufactories, turned by machinery at a speed as great as practicable without bursting the stone by the centrifugal force. Grindstones are commonly made of sandstone, of which, suitable for the purpose, there are quarries in the northern coal districts and the midland counties of England, and in Nova Scotia. Some of the best grindstones in the United States are brought from Berea, Ohio. Artificial grindstones of very uniform and perfect texture are made with emery (q.v.), in great variety of size and form, adapted to various uses; and are much used for work on metal surfaces, dispensing with slow and laborious hand-filing. Emery-wheels are made as large as 3 ft. in diameter, and so strong that they can be driven at 6,000 ft. per minute, when they will readily cut tempered steel. They wear very slowly, and when properly used keep themselves true. If a true surface is lost it can be restored only with a diamond, that alone being hard enough for the purpose.

GRINNELL, a village in Poweshiek co., Iowa, on the Central Iowa railroad, 55 m. e. of Des Moines; pop. 1,480. It is the seat of Iowa college (Congregational) founded in 1848. There is considerable manufacturing business in the village.

GRINNELL, HENRY, 1799–1874, brother of Moses H., and a partner in the great commercial house of Grinnell, Minturn & Co., New York. Having amassed a considerable fortune by his skill and success as a merchant, Mr. Grinnell devoted the latter part of his life to the extension of geographical knowledge, mainly in connection with the arctic regions. In 1850 he undertook the expense of fitting out an expedition in search of information concerning the ill-fated Franklin and Crozier expedition of 1845. The expedition comprised two vessels, and was commanded by lieut. De Haven, U.S.N. Unsuccessful in the immediate object of their search, the explorers were fortunate enough to make important additions to existing geographical knowledge of the polar regions. They discovered the extensive tract of land divided by Smith's Sound from Greenland, and named "Grinnell Land" after the enterprising and munificent New York merchant. This discovery brought about a sharp controversy with English geographers and explorers as to priority, which was finally concluded in favor of the American expedition, and the name "Grinnell Land" affixed permanently in place of that of "Prince Albert Land," which had been given it by the British. In 1853 Mr. Grinnell, with the aid of Mr. George Peabody, fitted out for a second expedition, the brig *Advance* commanded by Dr. Elisha Kent Kane, who had sailed as surgeon and naturalist with De Haven. This expedition doubtless accomplished more than any which had preceded it, having first definite evidence of the existence of an open polar sea, and defined the coast-line, and explored the interior of hitherto unknown lands. See KANE, E. K. Mr. Grinnell was the first president of the American geographical society, and his name and services are held in high respect both in America and England, and in the latter country, his liberal example induced such energy and enter-

prise as eventually resulted in clearing up the long mooted question of the fate of the Franklin expedition.

GRINNELL, Moses H., 1803–77; b. Mass.; an eminent New York merchant, the head of the firm of Grinnell, Minturn & Co. He was a representative in congress in 1839–41; and in 1869–71 collector of customs at New York.

GRINNELL LAND, the most northerly land of the American continent so far as discovered. It is separated from Greenland by Kennedy's channel. Lieut. De Haven, who commanded the ships sent out by Henry Grinnell from New York in 1850, claimed to have been the first discoverer, but the English also make their claim. In 1871 capt. Hall examined the e. coast as far up as 82° 16′, a few miles above which point the shore appeared to incline westward. This land is nearer to the pole than any other now known; the n. limits of Greenland have not been explored.

GRIPING, or Gripes, a popular name for all painful affections of the bowels, whether attended with constipation (q.v.) or diarrhea (q.v.). When pains of this kind are spasmodic, they are termed colic (q.v.) The action of purgative medicine is often attended by more or less of griping pain, which may be averted in certain cases by the careful choice of the medicine, or by combination of it with carminatives (q.v.), or with a little opium.

GRIPPE, a French name for influenza (q.v.).

GRI'QUALAND, a tract of country in s. Africa, to the n.e. of Cape Colony, lying about the junction of the Orange and Vaal rivers to the w. of the Orange River Free State. It derives its name from its inhabitants, the Griquas or Bastaards, a race sprung from the intercourse of Dutch settlers with Hottentot and Bush women. The area and population are uncertain. Some of the inhabitants are successful farmers, and there is a thriving settlement, Griqua Town, under the care of the London missionary society.—*Griqualand West* has of late years become famous from the discovery of the Cape diamond-fields, which are situated within its bounds. The first diamond was found in 1867, and for several years a strong tide of immigration flowed unceasingly. Various settlements were formed; digging was vigorously prosecuted; and all nationalities were represented. The territory in which the diamond-fields lie had been secured to a native chief, Waterboer, by the British government; but both the Orange River Free State, and the Transvaal Republic contested his boundaries, and the result was constant disturbances at the diggings. At length, in Oct., 1871, the British government of Cape Town issued a proclamation declaring Griqualand West British territory, and annexing it to Cape Colony. This was done with the assent of Waterboer, whose interests were not neglected. The principal settlements are Du Toit's Pan and De Beer. Pop. '72, 25,477; area about 17,800 sq.miles.—*Griqualand East* was incorporated with Cape Colony in 1874.

GRIQUAS, or Bastaards, people of s. Africa who are the offspring of native women by Dutch settlers. There are probably 15,000 of them on Orange river near the n. limit of Cape Colony. Some of them are partially civilized, and a considerable number are counted as Christians. There is a thriving settlement at Griqua Town, about 500 m. n.e. of Cape Town. Their chiefs are chosen by suffrage, and there are among them many prosperous farmers and cattle breeders.

GRISCOM, John, ll.d., 1774–1852; b. N. J.; studied in a Quaker academy, and at 17 began to teach. He was a teacher in New York for a quarter of a century. He made a tour in Europe to inspect institutions of charity, reform, and education, including manufactories, publishing his observations in *A Year in Europe*. The New York high school, forerunner of the free academy and the normal college (now the college of New York) was projected and for six years supervised by him. He was also one of the founders and secretary of a society for the prevention of pauperism. His latest work was the reform of the school system of New Jersey.

GRISCOM, John Hoskins, 1809–74; b. New York, son of John, the teacher. He was educated in medicine at Rutgers college, and Pennsylvania university, and for many years practiced in New York, being professor of chemistry in the college of pharmacy, and 24 years physician to the city hospital. He was also an active member of the prison association. Among his works are *Animal Mechanism and Physiology; Uses and Abuses of Air and Means for the Ventilation of Buildings; First Lessons in Physiology with Brief Rules for Health; Sanitary Legislation, Past, Present, and Future*, etc.

GRISE'LDA, or **GRISELDIS**, is the heroine of a celebrated mediæval tale, which probably had its rise in Italy. A poor girl, who was a charcoal-burner, was raised to be the wife of the marquis of Saluzzo, who put her humility and obedience to the severest tests. She, however, passed through them all triumphantly, and a reconciliation took place. In this legend the endurance and self-renunciation of the loving woman are represented as carried to the highest pitch. We find the tradition first worked up into a tale, said to be founded on fact, in Boccaccio's *Decameron;* Petrarch translated it into Latin in 1373, under the title *De Obedientia, et Fide Uxoria;* and in the 14th c. the story was well-known throughout Germany. In the year 1393 it was worked up into a "mystery" play in Paris; in England the drama of *The Patient Grissel*

appeared in 1599, and one on the same subject by Hans Sachs in Germany in 1546. Versions of the story are also found in the literatures of Holland, Bohemia, Sweden, Iceland, etc. The old German people's book, entitled *Markgraf Walther*, has lately been reproduced with more or less fidelity in Schwab's *Buch der Schönsten Geschichten und Sagen*, Marbach's *Volksbücher*, and Simrock's *Deutschen Volksbücher*.

GRI'SI, GIULIA, a celebrated vocalist, was b. at Milan in 1810. From a very early period she evinced the most remarkable musical genius, accompanied by a voice of the rarest promise. At the age of 16 she first appeared in the opera of *Zelmira*, at Bologna, and gathered her earliest laurels by the inimitable quality, melodiousness, and fidelity of her voice, as well as by her pathetic and lifelike impersonation of the rôle. Two years later, she appeared at Florence, and to no artist was pre-eminenee ever more unanimously accorded. Her greatest triumph, however, was obtained at La Scala, Milan, where she played the part of Norma in the tragic opera of that name. So thoroughly did she identify herself with this character, that hardly any subsequent singer has ventured on an original and independent personation. Grisi's début at Paris in 1832 was equally successful, and overcame the proverbial cynical apathy of the frequenters of the théâter Italien. London, however, was the scene of her grandest performances, and most appreciating audiences. Grisi was twice married, first, unhappily, to Mons. Gérard de Melcy, and secondly, to Signor Mario, the eminent tenor. She died in 1869.

GRIS-NEZ, or **GRINEZ,** CAPE, a headland of France, in the department of Pas-de-Calais, opposite Dover, is the point of land nearest to the English shore, the distance being barely 21 miles. Cape Gris-nez is about equally distant from Calias on the n.e., and Boulogne on the south. It is surmounted with a light-house, the lat. of which is 50° 52′ n., and the long. 1° 35′ east.

GRI'SONS (Ger. *Graubünden*), the largest and the most thinly peopled of all the cantons of Switzerland, is bounded on the n. by St. Glarus, St. Gall, and the Vorarlberg; on the e. by the Tyrol; on the s. by Lombardy; and on the w. by Uri and Ticino. Its area is 2,770 sq.m.; its population 1877, 92,106, of whom about 40,000 are Catholics. The canton divides itself naturally into three great valley-districts, of which the first and most important lies along the course of the Rhine, and stretches northward, occupying nearly the whole of the western portion of the canton; and the second, forming the Engadine (q.v.), extends n.e. along the course of the Inn. The third valley-district comprises several smaller valleys whose streams run southward, belonging to the basins of the Ticino and the Adda. The whole canton is an assemblage of mountains intersected by narrow valleys. The climate is very varied, in some districts winter reigns for nearly eight months, while some of the southern valleys resemble Italy. In the colder districts, scanty crops of barley and rye are raised with difficulty; while in the southern valleys, wheat, maize, and also the vine, fig, and almond are successfully cultivated. Pastures and forests occupy a large portion of the canton; and cattle, timber, and cheese are the principal exports. Iron, lead, copper, zinc, and silver are worked. The rivers abound in salmon and trout, and in the mountains are bears, wolves, lynxes, and wild-cats.

The country was anciently inhabited by the Rhætii, who are by some connected with the Etruscans (see ETRURIA). It was conquered by the Roman emperor Constantius in the 4th c., and his camp (*Curia, Chur, Coire*, the name of the present capital) was planted on the Rhine. Chur has been a bishopric since 450 A.D. In the 10th c. the country of the Grisons was added to the German empire, and remained till 1268 subject to the Swabian dukes. With the decay of the imperial authority it came to be oppressed by a numerous nobility, the ruins of whose castles still crown the heights. Against them the people began, in the end of the 14th c., to form leagues in the different valleys. One of these leagues, formed in 1424, was called the *gray* league (Ger. *der graue bund;* in the native language, *lia Grischa*), from the gray homespun worn by the unionists, and hence the German and French names of the canton—Graubündten and Grisons. In 1472 these separate unions entered into a general federation, which then formed an alliance with the Swiss cantons. It was not till 1803 that Grisons was admitted into the Swiss confederation as the 15th canton. The constitution of Grisons is very complicated, and suffers from the want of centralization incident to its origin. Of the inhabitants, one-half speak German, and the others dialects derived from Latin. The dialects of the southern valleys are a kind of Italian; the Latin of the Engadine (q.v.) and the Romanese differ greatly from Italian, but are far from being Latin.

GRISSEH, or GRISSEE, a t. in Java on Madura strait, having a large population of natives and Chinese. It is one of the oldest towns in the island, and the place where Mohammedanism was first permanently established. There is a good anchorage, and considerable business in ship-building. Salt and saltpeter are found in the neighborhood.

GRISWOLD, ALEXANDER VIETS, D.D.; 1766–1843; b. Boston. In 1795 he was ordained, and began preaching in three different towns besides teaching school. In 1804 he went to Bristol, R. I. He was the first bishop of the Protestant Episcopal diocese comprising Vermont, New Hampshire, Massachusetts, and Rhode Island. His last public act was the consecration of his successor, Dr. Eastburn. He published a large num-

ber of his discourses, and a volume of *Sermons on the Most Important Doctrines and Duties of the Christian Religion.*

GRISWOLD, MATTHEW, LL.D., 1716–99; b. Conn.; governor of the state in 1784; afterwards judge of the supreme court. He presided over the convention that ratified the constitution of the union.

GRISWOLD, RUFUS WILMOT, D.D., 1815–57; b. Vt. In early life he was a roving printer. Studying divinity, he became a Baptist minister, but most of his work was in literature as associate editor of *The New Yorker*, the *Brother Jonathan*, and the *New World*. In 1842 he was editor of *Graham's Magazine*, and in 1850 he started in New York the *International Magazine*. He is best known by his *Poets and Poetry of America*, and *Prose Writers of America*. He also published *Curiosities of American Literature*, *Washington and his Generals*, *Napoleon and the Marshals of the Empire*, and *The Republican Court, or, American Society in the Days of Washington.*

GRIT is a coarse-grained sandstone, the particles of which are more or less angular, and compacted together by a hard siliceous cement. See MILLSTONE GRIT.

GRIVEGNÉE, a t. of Belgium, in the province of Liege, and about two m. s.e. from Liege, on the right bank of the Ourthe. Steam-engines and other machinery are extensively manufactured; also nails, copper wire, and strings for musical instruments. Grivegnée has brickworks, and worsted and fulling mills. There are coal-mines in the vicinity. Pop. 6,234.

GROAT (Dutch, *groot*, Ger. *groschen*, Fr. *gros*, Ital. *grosso*, Low Lat. *grossus*, from the same root as Eng. *great*, and meaning *thick*), a name given in the middle ages to all *thick* coins, as distinguished from the "bracteates" (Lat. *bractea*, a thin plate or leaf), or thin coins of silver or gold-leaf stamped so as to be hollow on one side and raised on the other. Groats differed greatly in value at different times and in different countries. The silver groat once current in England (introduced by Henry III.) was equal to four pence. The coin—though not the name—has been revived in the modern fourpenny-piece. Groschen were till lately current in the n. of Germany. The silver groschen, or neu groschen of Prussia and the Zollverein, was $\frac{1}{30}$th of a thaler, and worth $1\frac{1}{2}d.$; the guter groschen of Hanover $= \frac{1}{24}$th thaler $= 1\frac{1}{2}d.$

GROATS (also locally *grits*, from the same root as *to grate*, to rub to powder; allied to Eng. *scratch*, and Lat. *rado*, to scrape), the grain of oats deprived of the integuments. Groats are much used for preparing *gruel* for invalids, and were formerly also often used in broths and soups like pot-barley.—*Embden groats* are groats broken into small pieces by crushing.—Concerning the nutritive and other qualities of groats, see MEAL and OATS.

GRO'DEK, or GRUDEK, a t. of Austrian Galicia, 15 m. w.s.w. of Lemberg, with which it is connected by railway, is situated partly on a hill between two small lakes, and partly on three small islands. Pop. '69, 8,000, consisting chiefly of German colonists, but including also a number of Jews.

GROD'NO, a government of Russia, in the province of West Russia, and formerly a portion of Lithuania, is bounded on the n. by the government of Vilna, on the e. by that of Minsk, on the s. by Volhynia, and on the w. by Poland and the province of Bialystok. It has an area of 14,532 sq.m., and a pop. of '70, 1,008,521. The land is, in general, flat, and belongs in the s.w. to the basin of the Vistula, in the n. to that of the Nieman, and in the s.e. to that of the Dnieper. In the s. extensive morasses occur, although much marshy land has been already converted into pasture-ground by draining; and in the n. are extensive forests, chiefly of pine. The soil is light and sandy (except that of the river-valleys, which is clayey), and is in general fruitful. Rye is the principal agricultural product, the average annual yield being estimated at 2,346,000 English quarters. Barley, flax, hemp, hops, and timber are also extensively raised. The bear, the lynx, and the buffalo are found in the forests. Cattle, sheep, and bees are largely reared. The chief branches of industry are the manufactures of cloth, hats, paper, and leather, and the principal exports are corn, cattle, wool, leather, hops, honey, and wax.

GRODNO, a t. of Russia, capital of the government of the same name, is situated on an elevation on the right bank of the Nieman, 160 m. n.e. of Warsaw. It has fourteen churches and convents, several synagogues and castles, some ruinous palaces, belonging formerly to old Lithuanian families; a gymnasium; manufactures in cloth, silk, and weapons; and a flourishing trade, which is almost wholly in the hands of Jews, who form about three-fourths of the population. The modern palace, erected here by Augustus III., is an extensive and handsome edifice. The other principal buildings are the market-place, the equestrian seminary, the high school, the academy for medical science, connected with which are a library, collection in natural history, and a botanic garden. Here, in 1586, Stephen Bathori died in his own castle; and here, Nov. 25, 1725, Stanislas Augustus abdicated the Polish crown. Pop. '67, 24,789.

GROG, the name applied in the navy to the mixture of rum and water served out as a beverage to the men. Under recent regulations men who prefer abstaining from grog are allowed to receive money or tea in lieu thereof. Forced potations of *six-water grog*, consisting of one part rum to six parts of sea-water, are administered occasionally, by

way of punishment for dirtiness and some other offenses. The quaint name of *grog* is said to be derived from a nick-name of admiral Vernon, who introduced it into the service. In bad weather, he was in the habit of walking the deck in a rough *grogram* cloak; the sailors thence called him *Old Grog*, and then transferred the name to the drink.

GROINED VAULTING is that kind of vaulting in which the vault is not a plain barrel-vault from end to end, but where one vault cuts into another. The angle formed by the intersection is called the groin. In Roman architecture the groins were generally left as a plain sharp edge; in Gothic, they were usually protected and strengthened with *ribs*. See VAULT.

GROMWELL (*Lithospermum*), a genus of plants of the natural order *boraginæ*, having a funnel-shaped corolla, stamens shorter than the corolla, and *achenia* of stony hardness. Probably, on account of the last-mentioned character, extraordinary virtues were formerly ascribed to them, particularly to the COMMON GROMWELL, (*L. officinale*), in the cure of stone in the bladder, which, however, were wholly imaginary. The common gromwell is a native of dry gravelly places in Europe, Asia, and North America. It has an erect, much-branched stem, broadly lanceolate leaves, and small greenish-yellow flowers.—CORN GROMWELL, (*L. arvense*) with small white flowers, is more plentiful in Britain, and is of equally wide geographic distribution.—Two species, natives of the s. of Europe, *L. tinctorum* and *L. anchusoides*, yield a dye-stuff similar to alkanet, and which passes under that name.

GRO'NINGEN (anc. *Cruoninga*), the most north-eastern province of the Netherlands, is bounded on the n. by the North sea, on the e. by Hanover, on the s. by the province of Drenthe, and on the w. by that of Friesland. It has an area of 896 sq.m., and on Dec. 31, '73, its population amounted to 232,739. It is watered by the Hunse, which is navigable for large vessels from the town of Groningen to its mouth in the Lauwer sea, by other small streams, and by lakes and numerous canals. Its surface is flat, and is protected against the sea on the n. by dikes. The soil, which is principally alluvium, forms excellent arable land. The n. of the province contains the best soil, and is one of the most densely peopled districts of the kingdom. A considerable portion of the land (towards the s.e.) is marshy, and lies in pasturage, which supports a fine breed of cattle, and great numbers of highly valued horses and sheep. Farming and grazing are the chief pursuits of the people; fishing, commerce, and trade are also carried on, as well as manufactures to some extent. Ship-building is extensively followed, and much butter exported. The people are almost entirely of the Frisian race, and belong chiefly to the Reformed church.

GRONINGEN, an important fortified t. of the Netherlands, capital of the province of the same name, is situated on the Hunse, at the confluence of the Aa with that stream, 22 m. w. of Dollart bay. It is nearly circular in form, surrounded by walls and a fosse, and traversed by canals crossed by 18 bridges. The Hunse is here converted into a canal, and is navigable for large vessels, about 600 of which visit the town annually. The great market-place is 662 ft. long and 389 ft. broad, and contains the beautiful Gothic church of St. Martin's, with a noble tower 343 ft. high. The university, founded in 1614, possesses a library, a botanic garden, and a cabinet of natural history. Groningen has railway communication with Friesland, Germany, and southwards to all the Netherlands towns. The port of Groningen is good; it communicates by means of canals with Dollart bay on the e., with the Lauwer sea on the n.w., and with the entrance to the Zuider Zee at Harlingen on the west. There are ship-building yards and paper mills. Pop. Dec. 31, '76, 40,589.

GRONOVIUS, or GRONOV, JACOBUS, 1645—1716; son of Johann Freiderich, b. Holland. While young he became fully acquainted with classical authors, traveled in England, Spain, Tuscany, Italy, Venice, Germany, and other countries, to see for himself the treasures in their famous libraries, and finally settled as professor in the university of Leyden. He was a fierce and abusive controversialist, and had hot disputations with Fabretti, Vossius, Bentley, and others. He left 46 works, the most important of which is an ancient Greek thesaurus.

GRONOVIUS, or GRONOV, JOHANN FRIEDRICH, 1611—71; a Dutch scholar and critic, educated at Leipsic, and professor of *belles-lettres* in Leyden. He wrote a large number of critical works on Latin classics, poetry, etc.

GROOT, GERHARD, or GERARD the GREAT, 1340—84; b. Holland; educated in Paris, and a teacher of theology at Cologne. He was not in holy orders, but held a number of benefices, living luxuriantly until turned from his ways by a Carthusian monk. He then gave up his benefices, and, refusing any higher position than deacon, became a traveling and highly successful preacher. He opposed the scholastics, advocated the reading of the scriptures, and translated the Psalms into the common language. He gathered a company for the transcribing of books of the Bible, and enforced upon them the practice of community of goods. From this association arose the "Brethren and Clerks of the Common Life." The order grew rapidly, and in spite of the violent opposition of the monastic orders they were sanctioned by the pope in 1376.

GROO'TE EY'LANDT (English, *Great Island*) lies off the western coast of the Gulf of Carpentaria, in North Australia, and is the largest island in that vast inlet, in lat. 14° s. and long. 136° 40′ e. Its extreme length and breadth are about 40 m. each. The center is mountainous, and the shores are dry and barren.

GROS, ANTOINE JEAN, Baron, a French historical painter, was b. at Paris on Mar. 16, 1771, studied in the school of David, and first acquired celebrity by his picture of Bonaparte as the victor of Arcola. The latter was so much pleased with the work that he appointed Gros a member of the commission charged with collecting the objects of art which had been ceded to France by the treaty of Tolentino. His first great achievement, however, was the "Pestiférés de Jaffa" (The Plague-smitten at Jaffa), which was executed at Versailles in 1804. It excited prodigious enthusiasm, the author being carried in triumph to the saloon of the Louvre, where the picture was crowned in his presence. Other important works executed by Gros during the consulate and the Empire are: "Bonaparte aux Pyramides," "Le Combat d'Aboukir," "La Bataille de Wagram," "Charles-Quint reçu à Saint-Denis par François Ier." After the return of the Bourbons Gros painted, among other pictures, "Le Depart Nocturne de Louis XVIII. au 20 Mars 1815," "La Duchesse d'Angoulême s'embarquant à Pauillac," and "Charles X. au Camp de Reims." Besides these he finished, in 1824, an immense work for the cupola of the church of Saint-Geneviève in Paris, begun in 1811, to which, say his countrymen, "there is nothing comparable." It is not a fresco, but a painting executed in oil upon a peculiar kind of plaster, representing the four great dynasties of France doing homage to the tutelary genius of the nation. Charles X. was so charmed with the work, that he raised Gros to the dignity of a baron, and doubled the sum which the painter had originally stipulated for. The rise of the romantic school bore away from him the tide of popularity, and Gros felt the ebbing of his fame so acutely, that it is suspected he committed suicide in a fit of profound chagrin. At all events, his body was drawn out of the Seine near Meudon, June 26, 1835. Gros's paintings are all marked by strength of effect, and dramatic movement in the scene; they are, however, deficient in delicacy and sentiment, and exhibit a very ordinary power of imagination.

GROSE, FRANCIS, 1731—91; an English antiquary who traveled into many out of the way corners in search of objects of antiquity. He was jovial and somewhat dissipated in his youth, as Burns implies in his verses beginning "Ken ye aught of Captain Grose." Probably the best known of his works is the *Classical Dictionary of the Vulgar Tongue*, which has served as the foundation of many slang vocabularies in England and America. He wrote besides on English, Welsh, Irish, and Scotch antiquities, and on fortification, and was the author of a work entitled *A Guide to Health, Beauty, Riches and Honor.*

GROSS, SAMUEL D., LL.D., b. Penn. 1805. He graduated in medicine and began practice in Philadelphia, at the same time translating French and German medical works. In 1830 he published *Diseases of the Bones and Joints.* In 1833 he went to Cincinnati and was made demonstrator of anatomy in the college of Ohio, and soon afterwards professor of pathological anatomy, in Cincinnati college, where he delivered the first systematic course of lectures on morbid anatomy ever given in this country, which was published as a treatise under the title *Elements of Pathological Anatomy*, 2 vols. 8 vo. Boston, 1839. In 1840 he became professor of surgery in Louisville college, and in 1850 professor of surgery in the university of New York, but the next year returned to Louisville. In 1856 he was chosen professor of surgery in Jefferson medical college, and in 1867 was elected president of the American medical association. He is the author of several valuable works on medicine and surgery, but is best known as the author of one of the most comprehensive and valuable works on surgery, *System of Surgery*, 2 v. 8 vo.

GROSS'BEAK (*Coccothraustes*), a genus of birds of the family *fringillidæ*, distinguished chiefly by the great thickness of the bill, which has also a proportionate strength, and notwithstanding the small size of the birds, is used for breaking the stones of cherries, olives, etc. The hawfinch (q. v.) and greenfinch (q. v.) are the British species, nor are there any others in Europe; but some are found in other parts of the world, as the beautiful EVENING GROSSBEAK (*F. vespertina*) and the ROSE-BREASTED GROSSBEAK (*F. Ludoviciana*) in North America

GROS'SENHAIN, or HAIN, formerly also called Markgrafenhain, is a small manufacturing t. of Saxony, situated on the left bank of the Röder, 20 m. n.w. of Dresden. It is famous for its woolen and cotton manufactures. Pop. '75, 10,686.

GROSSETESTE, ROBERT, a celebrated English prelate of the middle ages, was b. at Stradbrook, in Suffolk, in the latter part of the 12th c. He studied at Oxford, and subsequently at Paris. On his return to England, he obtained a great reputation as a divine, and was the first lecturer in the Franciscan school at Oxford. In 1235 he was elected bishop of Lincoln, and at once commenced in the most vigorous fashion the reformation of abuses in his diocese. The most conspicuous and offensive ecclesiastical sin in Grosseteste's days was the conduct of the pope (Innocent IV.) in the matter of church appointments. It was common for his holiness to make grants of vacant benefices in England to Italians, and other foreigners, many of whom, it would appear,

never showed face in this country at all, but contented themselves with drawing the revenues of their office. This was intolerable to a man like Grosseteste, and he set himself strongly against it, incurring, by his boldness, a temporary suspension from the exercise of his episcopal functions, and a continual menace of excommunication. One of these transactions in the year 1253 has been the subject of much controversy. It is alleged by some writers that Innocent wrote to Grosseteste, ordering his nephew, an Italian youth, to be promoted to the first canonry that should be vacant in the cathedral of Lincoln, accompanying his injunctions with threats. The bishop was filled with indignation, and at once addressed a letter either to the pope or his agents, in which he declares, that "if an angel from heaven commanded him to obey a mandate so absurd and sinful, he would not do it," and compares the nepotism of the pope to the sin of Lucifer and anti-Christ. Innocent, according to these writers, was violently enraged at his opposition; he excommunicated Grosseteste, and even appointed a successor to the bishopric, but in this instance the thunder of the Vatican was harmless. Grosseteste quietly appealed to the tribunal of Christ, and troubling himself no more about the matter, continued to discharge his episcopal functions. The general feeling of the English nation sustained him; the clergy of his diocese went on obeying him as if nothing had happened; and at his death, Oct. 9, 1253, archbishop Boniface conducted the funeral services. But Dr. Lingard (ii. p. 502) has shown that the mandate came not from the pope, but from the nuncio; that Innocent, on receiving Grosseteste's reply, not only rescinded the order, but adopted measures for the reform of these abusive appointments; and that the story of his having died under a sentence of excommunication rests on very questionable authority. Grosseteste is commonly regarded as one of the "reformers before the reformation." It is assumed that because he quarreled with the head of the church on a matter of discipline, he must have been a "Protestant." But nothing could be further from the fact than such an assumption. He belonged to that class of minds who look at truth not from the side of *doctrine*, but of *practice*. He would have accepted, with acquiescence, any new doctrine from the Vatican, but a knavish trick was not to be endured, even at the hands of an angel from heaven! It is in the last degree futile, therefore, to claim him as a precursor of men like Luther, or Calvin, or Knox. In politics he was a constitutionalist, and a friend of Simon de Montfort, heartily interested in the preservation and extension of such liberty as England then enjoyed. His learning was prodigious, almost inspiring awe among his contemporaries. Latin, Greek, Hebrew, French, mathematics, medicine, and music were among his attainments. His knowledge of the Scriptures is also particularly lauded. Grosseteste was one of the most voluminous authors that England ever produced. The list of his works, as given by Dr. Pegge, of which only a few have been published, occupies 25 closely printed pages in quarto. For an intelligent estimate of his life and character, see Mr. Brewer's *Monumenta Franciscana*, and the collection of his letters edited by Mr. Luard, and published (1862) under the title, *Roberti Grosseteste Episcopi quondam Lincolniensis Epistolæ*.

GROSSETO, a province of Tuscany, Italy, on the Mediterranean, 1712 sq.m.; pop. '72, 107,457. It is mountainous, marshy, and to a large extent unfit for cultivation. Sugar, lumber, and coal are among the chief products. The principal town bears the same name.

GROSSE'TO, a t. of central Italy, capital of the Maremma (q.v.) on the Ombrone, about 10 m. from its mouth, and 70 m. s. of Florence. The town is very unhealthy, but it is well built, and is regularly fortified, the walls forming a pentagon with brick bastions and two gates. It is the seat of a bishop, has a fine cathedral, two convents, hospital, etc., and in the center of the square a colossal statue of Leopold II. There are manufactures of silk, and woolen goods, glass, etc. About 6 m. from Grosseto are the ruins of the very ancient Etruscan city of *Rusellæ*, the Cyclopean walls of which may still be traced. It was at one time so powerful as to be one of the twelve cities of the Etruscan league. Pop. 3,000.

GROSS-GLOGAU. See GLOGAU, *ante*.

GROSSULARIA'CEÆ, a natural order of exogenous plants, containing about 100 known species, all shrubs, natives of temperate climates, and chiefly of the northern hemisphere. They have alternate lobed leaves. The calyx is 4–5-cleft, the tube entirely or in part adherent to the ovary; the petals are very small, alternate with the segments of the calyx; the stamens are alternate with the petals, and inserted into the throat of the calyx; the ovary is one-celled, with two opposite parietal placentæ; the fruit is a berry crowned with the remains of the flower, having numerous seeds immersed in pulp, and suspended by long threads; the *testa* externally gelatinous, adhering firmly to the horny albumen. The most important species of the order are the gooseberry (q.v.) and currants (q.v.).

GROSSWA'RDEIN (Magyar, *Nagy-Varad*), a t. of Upper Hungary, in the co. of South Bihar, is situated in a beautiful plain on the Sabes Körös ("the rapid Körös"), 38 m. s.s.e. of Debreczin. It is the seat of a Roman Catholic, and of a non-united Greek bishop, and consists of the town of Grosswardien proper, and eight suburbs. The town is surrounded by a wall, and was formerly a fortress. The principal buildings are the

churches, of which there are 22, including the cathedral, a magnificent edifice. A great trade is carried on here, especially in pottery, in cattle-rearing, and in the cultivation of the vine. There are several distilleries. The town is connected by railway with Vienna. The entire population of this town in 1869 was 28,698. Grosswardein was taken and pillaged by the Turks in 1660, and by the Austrians in 1692.

GROS VENTRES, American Indians dwelling with the Arrapahoes on the upper streams of the Missouri river. Their greatest chief was Sitting Squaw, a friend of the whites. In 1870 they numbered about 1300. They have good lodges, on a reservation of 260 sq. miles.

GROTE, GEORGE, politician, historian, and philosopher, was b. 1794, at Clay Hill, Beckenham, Kent. His grandfather, Andrew Grote, a native of Bremen, settled in London in the beginning of the last c,, and in conjunction with Mr. G. Prescott, founded the London banking-house that still bears their joint names. His mother, Selina Mary Peckwell, was the daughter of the rev. Dr. Peckwell, chaplain to the countess of Huntingdon, who married an Irish lady, descended from an old French family in Touraine, one of whom, being a Protestant, settled in this country after the revocation of the edict of Nantes. Grote was educated at Charter house, and at 16 entered his father's banking-house, employing all his leisure hours in study. In 1823 he began to amass materials for a history of Greece. Previous to 1832 he wrote on parliamentary reform, and threw himself into the agitation for the reform bill. After the passing of the bill he was elected at the top of the poll, a representative of the city of London in parliament, and continued a member of the house of commons till 1841. His parliamentary career was chiefly distinguished by his annual motion for the ballot, but he spoke with great effect on many other questions. In 1843 he retired from the banking-house, and devoted himself exclusively to his history; the first two volumes appeared in 1846, and the last (twelve volumes in all) in 1856. He forthwith commenced the study of Greek philosopy, and in 1865 brought out his work on Plato. The remainder of his studious life was devoted to Aristotle, but he did not execute more than a part of what he intended. He died in 1871. After his death, appeared what he had composed on Aristotle; also a collection of essays, entitled *Minor Works*, and, in 1876, *Fragments on Ethical Subjects*. *The Personal Life of George Grote* was written by Mrs. Grote. He spent much of his time, in later years, in the management of the great unsectarian education institutions—University college, and the university of London—being, at the time of his death, president of the one, and vice-chancellor of the other. His whole career was marked by attachment to liberal opinions. He was not merely a man of erudite research; he devoted himself also to mental philosophy and logic, by which he became as much distinguished in his capacity of historian of philosophy as he was in political history.

GROTEFEND, GEORG FRIEDRICH, 1775–1853; b. Germany; educated at Gottingen, was rector in Frankfort, founded a society for the cultivation of the German language, and became director in the Hanover lyceum. He was the author of several works upon ancient and modern languages.

GROTESQUE', a style of classical ornament, so called in the 13th c., from its having been re-discovered in the excavations made in the baths of Titus and other ancient Roman buildings, the Italian word *grotto* applying to any subterranean chamber. This light, fantastic style was much in favor during the renaissance. It abounds in all kinds of transformations, from the animal to the vegetable, and mingles all the natural kingdoms in the most fanciful and picturesque confusion. The name *grotesque* thus came by degrees to mean a fanciful combination of natural ideas as applied to ornament. Thus, all the picturesque animal and vegetable *inventions* of the mediæval artists are grotesques. Some of these are very beautiful, and others very picturesque, and, generally, an idea of some value, such as boldness, fierceness, dignity, etc., is expressed. In this mode of application, the grotesque is a valuable quality in art; it is only when it becomes debased, as in the monstrosities of the renaissance, that its value is lost.

GRO'TIUS, HUGO, or DE GROOT, was b. at Delft, April 10, 1583. His father, Jan de Groot, was burgomaster of the town, and also curator of the university of Leyden. In his 11th year he entered the university of Leyden, where he enjoyed the advantage of studying under Joseph Scaliger. In his 15th year he took his degree. In the following year he accompanied Olden Barneveldt, the grand-pensionary, on his embassy to France, where, notwithstanding his extreme youth, his talents and conduct gained him the favor of Henry IV. On his return he began to practice as a lawyer; and in 1607 was appointed fiscal-general, and in 1613 council-pensionary at Rotterdam. But the disputes between the remonstrants and their opponents were now at their height in Holland; Olden Barneveldt had the misfortune to be the protector of the former, and Grotius also supported them by his writings and favor. These religious, or rather theological strifes had, however, a *political* significance also; and the consequence was, that both Olden Barneveldt and Grotius were arrested, tried, and condemned by the dominant party under prince Maurice (see BARNEVELDT). Olden Barneveldt was beheaded in 1619, and Grotius sentenced to imprisoment for life in the castle of Lovenstein. He

escaped, however, by the contrivance of his wife, who managed to have him carried out of the castle in a chest used for the conveyance of books and linen, while she remained in prison in his stead. Her devotion was applauded even by his stern masters, and she was set at liberty.

For some time Grotius wandered about in the Catholic portions of the Netherlands, and finally escaped to France, where Louis XIII. bestowed upon him a pension of 3,000 livres; but not paying sufficient court to Richelieu, he lost the king's favor, and in 1631 his pension was withdrawn. A friendly letter from prince Frederick of Orange induced him to return to his native country; but by the intrigues of his enemies, sentence of perpetual exile was soon passed upon him. He now removed to Hamburg, and, while there, he received invitations from the kings of Denmark, Poland, and Spain; but the protection promised him by the chancellor Oxenstiern, and queen Christina's taste for literature, induced him to enter the Swedish service in 1634. As ambassador at the French court (1635–1645), he gained universal respect. On his return to Sweden, he passed through his native country, and was received in Amsterdam with the most distinguished honor. Equally flattering was his reception by the Swedish queen; but the literary dilettantism of Christina's court did not suit so serious and solid a scholar, whose thoughts were always of the broadest and most forecasting nature. Besides, the climate of Sweden did not agree with him, and he was probably anxious to spend the evening of his life in his native land. In consequence, he sent in his resignation of office to the queen, who, when she found that nothing could induce him to stay, presented him with a sum of 10,000 crowns and some costly plate, besides placing at his disposal a vessel to conduct him down the Baltic to Lübeck. A storm compelled him to land on the coast of Pomerania. While proceeding towards Lübeck, he was seized with a fatal illness, and died at Rostock, Aug. 28, 1645. To the talents of a most able statesman Grotius united deep and extensive learning. He was a profound and enlightened theologian—perhaps the best exegete of his day, a distinguished scholar, an acute philosopher, a judicious historian, and a splendid jurist. Altogether, he was what Ménage called him, "a monster of erudition." His metrical translations from the Greek authors also display superior poetical powers, he was one of the best modern writers of Latin verse, and likewise composed poems in the Dutch language. In spite of his broken, wandering and checkered career, Grotius found time to write a great variety of works. The first was the *Mare Liberum*, in which he defended the freedom of the Dutch East India trade. His chief work, however, is that entitled *De Jure Belli et Pacis*, which has been translated into all the languages of Europe. It may be considered as the basis of international law, and has long been used as a text-book on the subject in many universities. Among his other works we may mention *Annales et Historiæ de Rebus Belgicis* (Amsterdam, 1657), written in a style that equals Tacitus for concise and pointed power; *Annotationes in Vetus Testamentum* (Paris, 1644); *Annotationes in Novum Testamentum* (Paris, 1644); *De Satisfactione Christi*; and *De Veritate Religionis Christianæ* (Leyden, 1627), translated even into several oriental languages, and remarkable for its clear arrangement, vigorous logic, and eloquent style. It is reckoned the best "apology" for Christianity in modern times.—Compare Butler, *Life of Grotius* (London, 1826); De Vries, *Huig de Groot en Maria van Reigersbergen* (Amsterdam, 1827); Creuzer, *Luther und Hugo Grotius* (Heidelberg, 1846).

GROTON, a t. in New London co., Conn., on Long Island sound, intersected by the Stonington and Providence railroad; pop. 5,124. The township contains several thriving villages. One of the historical points is fort Griswold, where a white garrison was massacred early in the revolution by tories.

GROTON, a village in Middlesex co., Mass., on the Nashua and Worcester railroad, 31 m. n.e. of the latter city; pop. 1908. The Lawrence academy is an institution of importance, and there are other good schools.

GROT'TA DEL CANE, or GROTTO OF THE DOG, is a noted cave near Naples, in the vicinity of lake Agnano and of Puzzuoli. It is about 10 ft. deep, 4 ft. wide, and 9 high, and is so full of carbonic acid gas, especially near the floor, that little animals introduced into it soon die, and tapers placed near the ground are extinguished. This cave was known to the ancients, and is described by Pliny. It derives its name from the practice of introducing small dogs, which are soon almost deprived of life by the gas, but recover upon being restored to the open air.

GROTTA'GLIE, a t. in the s. of Italy, in the province of Lecce, 12 m. n.e. of Taranto. Pop. '72, 8,747. It dates from the 10th c., when the inhabitants of several surrounding villages, that had been laid in ruins by the Longobards and Saracens, sought refuge here, and gave the name of Grottaglie to their new dwellings, from the *grotte* or caves which intersect the hill at at the foot of which the town stands.

GROT'TE', a t. of Sicily, in the province, and 13 m. n.n.e. of Girgenti. It derives its name from the number of caves in the rocks around it, which prove it to have been an ancient site. It is supposed by some to be that of *Erbessus*, a town where the Romans deposited their military stores during their siege of Agrigentum, in 262 B.C., but which was seized by Hanno, the Carthaginian gen. Sulphur is found largely in the neighborhood. Pop. 7,300.

GROUCHY, EMMANUEL, Marquis de, 1766–1847; entered the French republican army in 1790, and two years later was maj.gen. of cavalry in the campaign against Savoy. Subsequently he defeated the Vendeans, served under Morreau in Piedmont, and was taken prisoner by the Austrians, kept a year, then joined Morreau and fought at Hohenlinden, at Jena, Eylau, and Friedland, with conspicuous gallantry. He won further distinction at Wagram and Boridino. He commanded the emperor's guard on the retreat from Moscow. On the return of Napoleon from Elba he was made a marshal, and in the close of the emperor's career, played a leading part, but by too literally obeying orders at the battle of Waterloo, he was the indirect cause of Napoleon's overthrow. Grouchy had been ordered to prevent the Prussians under Blucher from joining the English, and he obeyed to the letter. But had he taken the advice of his generals, and marched to Napoleon's aid at a time when the fight was so hot that Wellington cried "O for Blucher or night," he might have effected the entire defeat of the allies. He adhered to his orders, however, and Napoleon was lost. Under the second restoration he was proscribed, and for some years lived in Philadelphia, Penn. He returned to his native country in 1821, and after 1830 was restored to his rank of marshal.

GROUND, in painting, the coating or preparation put on the surface of the panel, board, or canvas on which a picture is to be painted. Artists attach great importance to the color and texture of the ground, as tending in no small degree to affect the technical quality of the work. In forming an opinion on paintings by old masters, the kind of ground used is always taken into consideration, for in different epochs and schools, particular grounds were used. The works of the Italian school preceding and during the time of Raphael were all painted on white grounds, and almost always on panels, even when the works were large, and many pieces had to be joined. The preparation was composed of *gesso*, plaster of Paris, or chalk mixed with size, and the ground was of course absorbent. Afterwards, when canvas came to be generally used, the works of the Italian and Spanish schools were generally painted on an oil ground of a dull red color; and when this was not covered by the artist with a thick *impasto* or body of paint, the picture was apt to become black and heavy, a fault very marked in the works of the school of the Carracci and the Neapolitan and later Roman schools. The works of the Dutch and Flemish masters, which are distinguished for brilliancy and transparency, were painted on light grounds, varying from white to gray, and their practice is generally followed in this country and in the modern schools abroad. The term *ground* is also applied to different parts of a picture, as the *foreground*, or portion of the picture on which are placed the figures or objects represented as nearest the spectator; *background*, the part, particularly in portraits, behind or on which it is intended to set off or relieve the head, figure, or group depicted. The portion of a model or carving from which the figures are projected, is styled the ground.

GROUND-ANNUAL, in the law of Scotland, is an annual rent or annuity paid by the owner of land to a creditor or to the vendor of the land, and in most respects corresponds to ground-rent (q.v.) in England, though the parties stand in a converse relation. It also resembles a rent-charge (see RENT) in England, with a like distinction. Thus, when a vendor sells his land, and instead of taking a lump sum for the price, prefers a sum by way of a perpetual annuity or rent, he conveys the land in fee to the disponee or purchaser, subject to this ground-annual, which is a burden on the lands forever after. The vendor or creditor is then called the ground-annualer, and if the ground-annual is not paid, he is entitled as a remedy to poind the ground, i.e., seize all the goods, whether of the owner or his tenants, which are found on the lands, and pay himself, or he may sue the debtor. But he cannot, as a ground-landlord can do in England, poind the goods of the debtor's tenants to a greater extent than the current term's rent or arrears due by them.

GROUND DOVE AND **GROUND PIGEON** are names given to those birds of the family *Columbidæ* which in characters and habits approach most to the ordinary gallinaceous type. They have short and rounded wings, with much inferior power of flight to pigeons in general; their legs are longer, and their feet rather adapted for walking than for grasping. They are little arboreal in their habits, but live mostly on the ground. Many of them run very quickly. They have not in general much brilliancy of plumage, but among them are the beautiful bronze-wings (q.v.) of Australia.

GROUND HOG. See WOOD-CHUCK, *ante*.

GROUND ICE, or ANCHOR ICE, a kind of ice of rare occurrence formed at the bottom of shallow streams.

GROUND-IVY, *Glechóma hederacea*, united with the genus *népeta* by some botanists as *N. glechoma*, a plant of the natural order *labiatæ*, a common native of Britain and other parts of Europe, growing in waste places, plantations, hedges, etc., in a dry soil. It has a creeping stem, kidney-shaped crenate leaves, and axillary blue flowers growing in threes. The flowers have four ascending stamens, two long and two short, a 15-nerved 5-toothed and equal calyx, the anthers before bursting approaching in pairs and forming a cross. A tea prepared from the leaves is in great repute among the poor in many places, and the plant is stimulant, aromatic, and of use in pectoral complaints. The leaves were formerly used in England for clarifying and flavoring ale, which was then

called gill-ale or gell-ale, from gill or gell, an old name of this plant; but this use has been discontinued since the introduction of hops.

GROUNDLING, *botia tænia*, a small fish of the family *cyprinidæ*, found in some of the rivers of England. It is never more than 3 or 4 in. long. It receives its name from habitually keeping close to the bottom. It is probably often mistaken for the loach (q.v.), which it much resembles; but, besides its smaller size, it is of a much more compressed form, and is particularly distinguished by a forked spine beneath each eye. These have been made generic distinctions. Several species having these characters are found in the Ganges.

GROUND-NUT, a term variously employed, to denote the seed of the *arachis hypogæa*, (see ARACHIS), and the tubers of certain umbelliferous plants, also called EARTH-NUTS (q.v.).

GROUND-PINE, the popular name of the *lycopodium clavatum*, an evergreen vine sometimes three yards long. It is of the genus *ajuga*. Another species is the club-moss, a handsome little plant of tree-like form about 8 in. high.

GROUND-RENT, in the law of England, is the rent which a person, who intends to build upon a piece of ground, pays to the landlord for the use of the ground for a certain specified term, usually 99 years. The usual arrangement between the owner of the freehold of land and a speculating builder, is of this kind. The builder pays a certain annual sum by way of rent to the owner, who is thereafter called the ground-landlord, and then commences to build upon the land. The builder then lets the houses, and in doing so he of course includes in the rent which he puts upon each house a proportionate part of this ground-rent, which he himself is bound to pay to the ground-landlord, so that practically the tenant pays both the rent and the ground-rent, the latter being so called because it issues out of the ground, independently of what is built upon it. Ground-rents often form a safe investment for capital, because the security is good. This security consists in the ground-landlord being able, whenever his ground-rent is in arrear, to distrain all the goods and chattels he finds on the premises, to whomsoever they may belong; and as the ground-rent is generally a small sum, compared with the furniture of the tenant, he is always sure to recover its full amount. This power of distress exists whether the tenant has paid his rent to his own landlord or not; but if at any time the tenant has been obliged to pay the ground-landlord the ground-rent, which it is the duty of his own landlord in general to pay, he may deduct such sum from the next rent he pays, or, as it is called, may set off the one against the other so far as it will go. Strictly speaking, there are thus two landlords. The ground-landlord is the over-landlord, and has the paramount security; the other landlord is landlord to the tenant who actually occupies, but is himself tenant to the ground-landlord, for he merely holds a lease. He is what is called a mesne landlord. At the end of the 99 years, or whatever other term is fixed upon, the whole of the building becomes the property of the ground-landlord, for the interest of the builder or his assignees then expires by effluxion of time; and as the building is a fixture, and cannot be carried away, it thus falls in to the landlord, and often thereby creates a great accession of wealth.

Ground-rent corresponds to *feu* in Scotland, with this difference, that the feu-rent in the latter case lasts forever, there being no definite term fixed for its ceasing.

GROUNDSEL, the common name of those species of *senecio* (q.v.) which have small heads of flowers either destitute of ray or with the ray rolled back. The COMMON GROUNDSEL (*S. vulgaris*), one of the most plentiful of weeds in waste and cultivated grounds in Britain and most parts of Europe, is usually destitute of ray. It is a coarse-looking annual, of rapid growth, about a foot high, branched, with pinnatifid leaves, and small yellow heads of flowers; flowering at all seasons, even in winter, when the weather is mild; and its seeds, like those of other *compositæ*, are widely diffused by means of their hairy pappus, being wafted about by the wind. It has a rather disagreeable smell; but birds are very fond of the young buds and leaves, and cage-birds are fed on them. It has a saltish taste, whence its name. Its leaves, beaten into a coarse pulp, and externally applied to the stomach, cause vomiting some hours after their application; it also makes a good poultice for boils and sprains.—The other British species are weeds of very similar appearance, but are stronger, have a more disagreeable odor, and are viscid to the touch.—Like other annual weeds, the groundsels are to be hoed down or pulled as they appear, when the ground is in crop.

GROUND SQUIRREL, *tamias*, a genus of rodent quadrupeds of the squirrel family, differing from the true squirrels in the possession of cheek-pouches, in having a more slender body and shorter legs, and in other less important particulars; but most of all in their habits, residing chiefly on the ground, and seldom ascending trees to any considerable height. They are of small size, are all longitudinally striped on the back and sides, are extremely active and restless, and emit a peculiar "chipping, clucking sound, very widely differing from the quacking, chattering cry of the squirrels." A well-known species is the HACKEE or CHIPPING SQUIRREL (*T. lysteri*) of North America, of a brownish-gray color, striped with black and yellowish white, the belly white. It is much persecuted by boys, with whom the hunting of it is a favorite sport. The fur is

used for muffs, tippets, etc. Other species of ground squirrel are found in America, Asia, and Africa.

GROUP, the combining of several bodies so as to form an agreeable whole. In drawing, one or more groups compose the picture. A bunch of grapes, a cone, or a pyramid have been taken by different artists as the model form of a group.

GROUSE, *tetrao*, a genus of gallinaceous birds, which, as defined by Linnæus, included partridges, quails, and all the birds now forming the family *tetraonidæ*, and divided into many genera. The *tetraonidæ* have a very short bill, rather thick, sharp, and a little curved, and very generally a naked red patch over or behind the eye. They have three toes before, and generally one hind toe, placed high on the tarsus, but the hind toe is often very short, and sometimes wanting. Those to which the name Grouse is popularly given have the legs feathered to the feet, but in the genus *tetrao*, as now restricted by ornithologists, the toes are not feathered; in moorfowl and ptarmigan, they are completely so, and these have therefore been separated into a distinct genus, *lagopus*. Partridges, quails, etc., which have not the tarsi feathered, are regarded as connecting the families *tetraonidæ* and *phasianidæ*, and are sometimes referred to the latter, although their intimate connection with the former is generally recognized. Some of the *tetraonidæ* are polygamous, and this is the case with all, or almost all, the species of the genus *tetrao*, whilst those of *lagopus*, so nearly allied to them, pair.—The genus *tetrao* contains the largest birds of the family, exceeded in this respect by almost no other gallinaceous birds. They have a full figure, with much muscular power, the tail is longer than in most of the family, is composed of broad feathers, and generally rounded. The females differ very considerably in plumage from the males, which are often resplendent in black, brown, green, and blue. The species are natives of the northern and temperate parts of Europe, Asia, and America, the regions in which the *tetraonidæ* in general are most abundant, although some of the family are found in warmer and more southern countries.—The largest species of *tetrao* is the capercailzie (q.v.), Wood grouse, or cock of the woods (*T. urogallus*); and next to it, among European species, ranks the blackcock (q.v.), (*T. tetrix*), the only other European species indeed, if the somewhat rare *T. hybridus* of continental Europe, the *racklehahn* of the Swedes (see Blackcock), be regarded as the result of a mere accidental intermixture of these two. —The Pinnated Grouse, or Prairie Hen (*T. cupido*) of North America, is rather smaller than the blackcock; the general color of the plumage is yellowish-red, with bars and crossings of black; the tail is very short and much rounded. The male has neck-tufts of narrow feathers, the largest of which are five inches long, and is still more remarkably adorned with two loose pendulous wrinkled skins, extending along the sides of the neck for two-thirds of its length, capable of inflation with air, and when inflated, resembling in bulk, color, and surface, middle-sized oranges. This species of grouse chiefly inhabits dry open districts, studded with trees or patches of brushwood. It was at one time common in New Jersey and Pennsylvania, as well as in the western prairies, but has always become rare as a district has become cultivated and populous, notwithstanding laws in some cases enacted for its preservation. It has almost disappeared from the state of Kentucky, where it was at one time so extremely abundant, that children were constantly employed to prevent its depredations in the cultivated fields, and multitudes were shot and trapped merely to be thrown away. In the north-eastern parts of the United States it exists, but is not abundant. It congregates in flocks in winter, which break up into smaller parties in spring. The males have many combats at the approach of the breeding season. Their voice is described as a low *tooting* or *booming*. They strut, after the manner of turkey-cocks, with wings let down to the ground, and neck-feathers erected. Certain spots, known in the western parts of America as their *scratching-places*, seem to be specially appropriated for their displays and combats, and there considerable numbers often meet about daybreak, dispersing again after the sun is up. Many are shot on such occasions. The food of the pinnated grouse consists of seeds, berries, the buds of trees and bushes, insects, etc. It is highly prized for the table in those parts of America where it is rare. The flesh resembles that of the blackcock.—The Spotted Grouse, or Canadian Grouse (*T. Canadensis*), is smaller than the pinnated grouse, about equal to the Scottish moorfowl. It inhabits the northern parts of America, and is plentiful near Hudson's bay. It is chiefly found in forests of pine or fir, feeding much in winter on the leaves and branchlets of these trees, as well as on their seeds, whence it is often called the spruce partridge. From this food the flesh acquires a strong and peculiar flavor in winter. The plumage of the upper parts is mostly brownish-black, transversely barred with brownish-gray; in some parts varying to a rusty orange. The tail is rounded.—The Dusky Grouse (*T. obscurus*) is a species almost as large as the capercailzie, a native of the shady forests of the Rocky mountains and the banks of the Columbia. The general color is blackish-brown, the wings lighter. The tail is large and rounded.—The Moorfowl (q.v.), or Red Grouse of Britain, is allied to the ptarmigans rather than to these species, and is called red ptarmigan by some systematic writers, although it is the species to which, in popular language, the name grouse is almost exclusively appropriated in Britain. Other species, often popularly called grouse, are noticed in the articles Bonasia, Cock of the Plains, Ganga, Syrrhaptes, etc.

GROUSSET, PASCHAL, b. Corsica 1845; became a journalist in Paris and wrote with Rochefort for the *Marseillaise*. He was always an extremely violent radical as was shown in his furious journal *La Bouche de Fer*. Under the insurrection in 1871 he was foreign minister of the central committee and held the same position in the commune. In June he was arrested in the disguise of a female. He was exiled to New Caledonia in 1872, and escaped two years afterwards.

GROVE, Sir WILLIAM ROBERT, b. England 1811; educated at Oxford. He began the practice of law, but left it for the study of electricity with which his name is associated in the powerful Grove battery. He was professor of experimental philosophy in the London institution, and a member of the council of the royal society. Returning to the law he became prominent in the South Wales and Chester circuits. He was knighted in 1872 when he was a justice of the common pleas. Afterwards he became judge of the high court of justice. He has published several works on subjects connected with electricity and electrical experiments, and an essay on *The Correlation of Physical Forces*, which has been translated into various European languages.

GROVER, CUVIER, b. Me., 1829; a graduate of the military academy. He served with credit on the union side in the war of the rebellion, attaining the rank of maj.gen. of volunteers. In the regular army he is a col. of cavalry.

GROVES have, among almost all nations, been associated with religious rites, being chosen as suitable places for them, or even planted in order to this use. The pleasantness of groves may have had something to do with this, but probably far less than the sentiments of awe and solemnity naturally excited by the gloom of deep forests. Groves became so intimately associated with the idea of sacrifice and other religious rites, that the planting of a grove became itself an act of religion, like the erection of an altar or the building of a temple. Thus, "Abraham planted a grove in Beersheba, and called there on the name of the Lord, the everlasting God" (Gen. xxi. 33). Afterwards, however, the Jews were forbidden to plant groves near the altar of the Lord (Deut. xvi. 21, 22), because of their association with idolatry, and with the cruel and abominable rites of the nations of Canaan, and of the neighbors of the Jews.

GROVETON. See BULL RUN, SECOND BATTLE OF.

GROW, GALUSHA A.; b. Conn. 1823; graduated at Amherst college 1844, and entered upon the study of the law. He injured his health by over-study, and on being admitted to the bar in 1847, settled in the elevated regions of central Pennsylvania, where he became in 1850 state surveyor of wild lands. He was elected from Pennsylvania to each alternate congress from 1851 to 1863, and was speaker of the house of representatives 1861–63. He was a delegate to the Baltimore republican convention of 1864, which nominated Lincoln and Johnson. In 1875 he was out of politics, being president of a railway company, and residing in Houston, Tex. In 1878 he declined the nomination for congress, and the same year was a candidate for the nomination for governor of Pennsylvania, making a sharp contest, but being defeated by H. M. Hoyt. He continued prominent in politics in 1879–80, and at the present time (Dec., 1880) is prominent among the candidates for U. S. senator from Pennsylvania.

GROWING CORN on a farm, or on land let to a tenant, may be distrained in England by the landlord for rent which is already due and in arrear; that is, the landlord may seize and sell the corn to pay his rent. In Scotland, growing corn may also be sequestrated by the landlord (which means the same thing); but this can be done only for the rent which is current, and which will become due for the same year to which the crop belongs. In England, the landlord can distrain for several years' rent at one time.

GROWLER, *Grystes salmoides*, a fish of the perch family, abundant in many of the rivers of North America, as in the neighborhood of New York. It attains a length of two feet. It is of an olive color, dark on the upper parts, and becoming grayish-white beneath. The growler is much esteemed for the table. It affords good sport to anglers. It receives its name from a sound which it emits. The genus grystes has small scales and only fine cardlike teeth. Another species is found in the Macquarie river, in New Holland.

GRUB, the name commonly given to the larvæ of coleopterous insects. See COLEOPTERA. Some grubs are too well known to farmers and gardeners for the injury they do to the roots of plants, and thus we hear of crops suffering from *the grub*, but different species are destructive to different kinds of plants. The most important are noticed under their proper names, and reference is made from the more important cultivated plants to those grubs most hurtful to them.

GRUBBER, an agricultural implement which has recently come into very general use, and of which there are many forms or varieties, all, however, essentially the same in their principle as well as in their uses. Some of the forms are called by their inventors *cultivators* and *scarifiers*. The grubber consists of a framework of cast or wrought iron, in which are fixed *tines* or teeth, somewhat like those of a harrow, but curved, and so placed as to enter the ground somewhat obliquely when the implement moves forward; the whole moving on wheels, by which the depth to which the teeth may penetrate is regulated; it is provided with various mechanical adaptations, enabling the workman

somewhat to vary the depth, or to lift the teeth out of the ground partially or altogether, when it may be necessary to clear them of obstructive clods or accumulations of weeds, to turn at the head of a ridge, or to travel to or from the field. The grubber is sometimes used for tearing up clover-fields and stubbles before the plough is used, but more generally in land already ploughed, to stir it afresh, to clear it of weeds, to bring clods to the surface, that they may be broken, etc. A grubber with five teeth gives work for two strong horses.

GRUBER, JOHANN GOTTFRIED, 1774–1851 ; b. Prussia ; the author of a large number of works on imaginative, historical, and critical subjects, and with Ersch edited the *Allgemeine Encyklopädie der Wissenschaften und Künste*, made the most voluminous encyclopædia in any European language.

GRU'GRU, the grub or larva of *Calandra palmarum* (also called *Rhyncophorus palmarum*, and *cordylia palmarum*), an insect of the weevil family (*Rhyncophoræ*), inhabiting Guiana and other tropical parts of America. The perfect insect is an inch and a half long. The grub is an ugly inactive creature of a whitish cream color, as long and as thick as a man's thumb, and lives in the soft and spongy central part of the cabbage palm (*euterpe oleracea*), on which it feeds. It is extremely fat and oily, and is esteemed a great delicacy, not only by the Indians, but by many of the European colonists and their descendants, particularly the Dutch. It is cooked by roasting, and eaten with bread and butter, after being sprinkled with cayenne pepper, The fragrance of roasted grugru is said to be most tempting to epicures. A cabbage palm which has been cut down often becomes in a short time almost filled with grugrus; but they are usually obtained from the upper part of the stem of growing palms near the crown. A negro is often sent up with a cutlass, to cut them out of the wood.

GRÜN, ANASTASIUS. See AUERSPERG, A. A.

GRÜN'BERG, a t. of Prussia, in the province of Silesia, is prettily situated near the northern boundary of the province, on the Golden Lunse, 59 m. n.n.w. of the town of Liegnitz. It consists of the town proper, surrounded by a wall, pierced by three gates, and of four important suburbs, and is seated amid vine-clad mountains. Grünberg is chiefly known for the fine sparkling wine which is extensively produced in the vicinity. The 700th year of its trade in this excellent commodity was celebrated here in Oct., 1850. Grünberg has also an active trade in the manufacture of woolen cloths and tobacco, and in the growing of fruit. Pop. '75, 12,248.

GRUNDTVIG, NICOLAI FREDRIK SEVERIN, 1783–1872 ; b. Denmark ; educated at Copenhagen. He became a leader of the Danish party in the diet, favored a union of the Scandinavian kingdoms, and vigorously opposed German influence. He is best known by his books on *Northern Mythology*, a translation of *Saxo Grammaticus*, and some volumes of poetry.

GRUNDY, a co. in n.e. Illinois, on the Illinois river, and the Chicago and Alton, and Chicago, Rock Island and Pacific railroads ; 432 sq.m. ; pop. '80, 16,738. It has a level surface and fertile soil ; chief productions: corn, oats, hay, and cattle. Co. seat, Morris.

GRUNDY, a co. in n.e. Iowa on the affluents of Red Cedar river ; 500 sq.m. : pop. '80, 12,639. It has an undulating surface and a fertile soil, producing corn, wheat. oats, hay, etc ; Co. seat, Grundy Center.

GRUNDY, a co. in n. Missouri on Weldon river, crossed by the Chicago, Rock Island and Pacific railroad ; 462 sq.m.; pop. '70, 10,567—115 colored. It has a prairie surface, and the soil is fertile ; chief productions: wheat, corn, oats, butter, and wool. Co. seat, Trenton.

GRUNDY, a co. in middle Tennessee on the Rock and Elk rivers ; 340 sq.m.; pop. '70, 3,250—137 colored. The surface is rough and mountainous, but the soil is fertile, producing wheat, corn, and cotton. Co. seat, Tracy City.

GRUNDY, FELIX, 1777—1840 ; b. Va. ; educated for a physician but went into law practice. He was member of the state constitutional convention, of the legislature, and judge of the court of errors and appeals. About 1807 he was made chief-justice of Kentucky, but he almost immediately resigned and settled in Nashville. He was twice chosen a member of congress, and in 1829 became a senator and an active supporter of president Jackson. In 1838 he was appointed attorney-general of the United States.

GRUNER, WILHELM HEINRICH LUDWIG, b. Germany, 1801; studied in various countries, and became noted as an engraver. At the king's desire he produced for the Berlin museum a number of Raphael's cartoons from the originals at Hampton court. He had a share in the decoration of the London crystal palace, and in the decorations of Osborn castle and Buckingham palace. Among his works are "Fresco Decorations and Stuccos," Layard's "Nineveh," Raphael's "Caryatides from the Vatican," and "Bas Reliefs on the Façade of the Cathedral at Orvieto."

GRUS AND GRUIDÆ. See CRANE.

GRUTLI, or RUTLI, a small tract of meadow in Uri canton, Switzerland, about 5 m. s.w. of Schwytz, believed to be the place where in Nov., 1307, Arnold of Melchthal,

Fürst, and Stauffacher planned the revolt against Austria which resulted in the independence of Switzerland. The tract was purchased in 1858 by the Swiss republic. Tell chapel is 3 m. distant from Grutli.

GRUYÈRES, a small decayed t. of Switzerland, in the canton of Freiburg, and 16 m. s.s.w. of the town of that name, is situated in about a mile from the left bank of the Saane or Sarine. The town is known chiefly from its giving name to the famous Gruyères cheese, which is made in great quantities in surrounding district. Pop. '70, 1097.

GRYLLUS, a Linnæan genus of insects of the order *orthoptera,* answering to the section *saltatoria* (Lat. leapers) of later entomologists, and containing crickets, grasshoppers, locusts, etc. The genus has been subdivided into many genera, which have been grouped into families; but great confusion exists in the nomenclature, the crickets and their allies being the genus *gryllus,* and family *gryllidæ* of some authors, *acheta* and *achetidæ* of others; grasshoppers being *gryllus* and *gryllidæ* of some, *locusta* and *locustidæ* of others; and locusts in like manner being *locusta* and *locustidæ,* or *acrydium* and *acrydidæ.* See CRICKET, GRASSHOPPER, and LOCUST. The three groups are very closely allied. They are all characterized by the large thighs of the last pair of legs, and great power of leaping. The stridulous sounds which they emit are produced in some—crickets and grasshoppers—by rubbing together the bases of the elytræ; in others—locusts—by rubbing the thighs against the elytræ. The females generally lay their eggs in the ground.

GRYS-BOC (*Antilope melanotis* or *Calotragus melanotis*), an animal of the antelope family, a native of s. Africa, and common in most parts of Cape Colony. It is about three feet in length, and about a foot and a half in height at the shoulder. The Grys-boc lives in pairs on the plains. It is not very swift, is easily captured, and its flesh is much esteemed.

GUACA, or HUACA, a Peruvian word which the Spanish writer Herrera affirms means temple. Another writer takes it to be a name for the evil spirit. At the present time it is the name for the grave of an Indian. A little more than 20 years ago there was much excitement in Central America in consequence of the finding in these old tombs of small images of gold representing indigenous animals. The presence of the figures has been explained by the assumption that they were the handiwork of artificers who belonged to a race which inhabited the Pacific shores of America, at a period long anterior to that of the ancient Peruvians.

GUACHA'RO, *Steatornis Caripensis,* a remarkable South American bird, of the order *insessores,* and tribe *fissirostres,* generally referred to the family *caprimulgidæ,* but widely differing from the goatsuckers and most of that family, and indeed from the *insessores* generally, in having a strong bill, and being frugivorous. The food of the guacharo consists of hard and dry fruits. It is about the size of a common fowl; the plumage brownish gray, with small black streaks and dots. The guacharo is a nocturnal bird, a circumstance very singular among frugivorous birds. It spends the day in deep and dark caverns, where great numbers congregate and make their nests. Humboldt gives a most interesting account, in his *Personal Narrative,* of a visit to the great guacharo cavern in the valley of Caripe, near Cumana. This cavern is visited once a year for the sake of the fat of the young birds, which are slaughtered in great numbers, and their fat melted and stored for use as butter or oil. The clarified fat is half liquid, transparent, inodorous, and will keep for a year without becoming rancid.

GUACHINAN'GO, a small t. of Mexico, in the n. of the state of Puebla, and 103 m. n.e. of the city of Mexico, has a population of 6,000, and is noted for the great quantity of excellent vanilla raised in the vicinity.

GUA'CHOS, the name given to the country-people who inhabit the pampas in the states of La Plata, and are engaged in rearing cattle. Although they pride themselves on being whites, they belong chiefly to the Mestizo class, and by their intercourse with Indian women, contribute to approximate the population of the inland provinces to the type of the aboriginal inhabitants, whom they likewise greatly resemble both in their manners and turn of mind.

GUADALAJARA, a province of Spain, the most north-eastern of the five modern provinces into which New Castile has been divided. Pop. '70, 208,638. See CASTILE.

GUADALAJARA (anc. *Arriaca*), a decayed town of Spain, capital of the province of the same name. is situated on the left bank of the Henares, 35 m. n.e. of Madrid. It is a large but ill-built town, and contains many buildings of interest, which, however, are for the most part falling to ruin from neglect. The chief of these are the palace of the Mendozas, the feudal lords of Guadalajara, the *Panteon,* in which they are buried, and the churches of San Francesco and San Esteban. Guadalajara is the chief town of the fine pastoral and wheat district of the Alcarria. Pop. 7,650.

GUADALAJARA, or GUADALAXARA, one of the handsomest towns in Mexico, is the capital of the state of Xalisco, in the Mexican confederation. It stands on the Rio Grande de Santiago, which, after passing through Lake Chapala, enters the Pacific at San Blas. The population has been estimated at 90,000. As the houses are generally but two stories high, the place covers a wide extent of surface. It contains the build-

ings for the government, a cathedral, a mint, an episcopal palace, an opera, large barracks, a college, and many inferior seminaries. It has well-supplied markets, and extensive manufactures of cotton and earthenware.

GUADALAVIA'R, or TURIA, a river of Spain, has its source near that of the Tagus, in the s.w. of Aragon, and after a course of 130 m. in a generally s.s.e. direction falls into the Mediterranean, at Grao, a mile and a half e. of Valencia. The Guadalaviar, in passing through the beautiful gardens of Valencia, is divided, for the purpose of irrigation, into eight canals. Its mouth is much silted up.

GUADALQUIVIR (Arab. *Wad-al-Kebir*, the great river; anc. *Baetis*), the most important river of Spain, for the mass of waters which it conveys to the ocean, and for the extent of its natural navigation; has its origin in the Sierra de Cazorla, near the eastern border of the province of Jean; flows in a general s.w. direction through the provinces of Jean, Cordova, Sevilla; and forming the boundary for about ten miles between the provinces of Huelva and Cadiz, falls into the Atlantic at San Lucar de Barrameda, after a course of about 360 miles. The principal towns upon its banks are Montoro, Cordova, and Sevilla, to the last of which, about 80 m. above its mouth, the river is navigable. Below Sevilla it twice divides itself into two branches, forming two islands—the Isla Menor and the Isla Mayor. Its chief affluents are the Gadajos and the Jenil on the left, and the Guadalimar and the Guadiato on the right. The lower course of the Guadalquivir is sluggish and dreary in the highest degree; the stream itself is turbid and muddy, and eats its way through an alluvial level given up to herds of cattle and to aquatic fowls. There are no villages in this district, which, though favorable to animal and vegetable life, is fatal to man, from the ague and fever caused by the numerous swamps. There is no great trade on the Guadalquivir; foreign vessels are generally moored at the Isla Menor, and their cargoes sent up to Sevilla by means of barges.

GUADALU'PÉ, a river of North America, rises in the southern section of the state of Texas, and flows in a south-eastern direction, emptying its waters into Espiritu Santo Bay, after a course estimated at about 250 miles. The geography of this stream and its capabilities are not yet well-known.

GUADALUPE, a co. in s. central Texas, on the Guadalupe river, crossed by the Galveston, Harrisburg, and San Antonio railroad; 750 sq.m.; pop. '70, 7,282—2,534 colored. A large part is yet covered with forests. The soil is fertile; chief productions: cotton, corn, cattle, and pork. Co. seat, Seguin.

GUADALUPE MOUNTAINS, between the Pecos and the Rio Grande, in New Mexico and Texas, united on the n. to the Rocky mountains.

GUADALUPE-Y-CALVO, a t. of Mexico, in the state of Chihuahua, and 170 m. s.s.w. of the town of that name, is situated in a mountainous district, in close vicinity to several important silver mines. Pop. 10,000.

GUADELOU'PE, one of the Lesser Antilles in the West Indies, and the most important of those which belong to France, lies in lat. 16° n., and long. 61° 45′ w., and contains 500 sq.m., with a population (including dependencies) in 1874 of 167,344, of whom three-fourths are colored. It is divided into Grande Terre on the e., and Basse Terre or Guadeloupe proper on the w., by a strait of about 40 yards in width, which under the name of Salt river, is navigable for vessels of 50 tons. The nomenclature of the separate islands is apparently out of place, for of the two, Basse Terre is the loftier, and Grande Terre is the smaller. Grande Terre, generally low, is of coral formation; Basse Terre, on the contrary, is traversed by volcanic mountains, which culminate in La Suofrière (the "Sulphur Mine") to the height of 5,108 feet. Though this range shows no regular crater, yet it emits, by several orifices, columns of smoke, and even sparks of fire. In addition to these symptoms of subterraneous action, may be mentioned a boiling spring and frequent earthquakes. Basse Terre, on the island of its own name, is the chief town, having an indifferent harbor. Connected with Guadeloupe, as dependencies, are the neighboring islets of Desirade, Marie, Galante, Les Saintes, and the n. part of St. Martin. In 1870 the exports to France amounted to 24,900,000 francs, and the imports from France to 9,800,000 francs. In 1848 slavery was abolished by a decree of the French republic. The island was discovered by Columbus in 1493; but it was not before 1635 that it was colonized by the French; and after repeatedly falling into the hands of England, during her wars with France, it was at length permanently ceded to the latter power in 1816.

GUADIA'NA (anc. *Anas*), one of the longest but at the same time the narrowest and poorest in volume of the five great Spanish rivers, rises on the western boundary of Murcia, about 8 m. n.w. of the town of Alcaraz. From its source it flows n.w. for about 30 m., after which it disappears among swamps; flows underground in a westward direction for nearly 30 m.; and rises again at Daymiel, after throwing up in its subterraneous course numerous lakes called *Los ojos* (the eyes) *de la Guadiana*. From Daymiel it pursues a westward course through La Mancha and the province of Estremadura, until, passing the town, of Badajoz, it bends southward, and flows in that direction, forming for about 35 m., the boundary between Spain and Portugal. Near the town of Monsaras it enters the Portuguese territory, and flows through the eastern district of the province

of Alemtejo. Finally, turning eastward, and again forming the international boundary for about 30 m., it enters the Atlantic below the town of Ayamonte. It is about 520 m. in length, and is navigable only for about 35 miles. Its chief affluents are the Giguela on the right, and the Javalon and Ardila on the left.

GUADIX, a city of Spain, in the province of Granada, on the n. slope of the Sierra Nevada and the river Guadix, 42 m. e.n.e. of Granada; pop. 10,154. It is said to have been the first bishop's see in Spain. It is inclosed by walls and contains the ruins of a Moorish castle and a cathedral. The Moors made strong defense here until 1489.

GUA'DUAS, a city of the United States of Colombia, is situated in that portion of the republic which belongs to South America. It stands near the e. or right bank of the Magdalena, high among the Andes, and is one of the most elevated towns on the globe, being 8,700 ft. above the level of the sea. It contains about 4,000 inhabitants.

GUAIA'CUM, a genus of trees of the natural order *zygophyllaceæ*, natives of the tropical parts of America, having abruptly pinnate leaves, and axillary flowers on one-flowered stalks, often in small clusters. The flowers have a 5-partite calyx, 5 petals, 10 stamens and a tapering style; the fruit is a capsule, 5-angled and 5-celled, or the cells by abortion fewer, one seed in each cell. The trees of this genus are remarkable for the hardness and heaviness of their wood, generally known as *lignum vitæ*, but sometimes as *guaiacum wood*, and sometimes as *Brazil wood;* as well as for their peculiar resinous product, *guaiacum*, often but incorrectly called *gum guaiacum*. The species to which the commercial lignum vitæ and guaiacum are commonly referred, is *G. officinale*, a native of some of the West India islands, and of some of the continental parts of America; a tree sometimes 30 or 40 ft. high, with two or three pairs of ovate, obtuse, and perfectly smooth leaflets, pale blue flowers, a furrowed bark, and generally a crooked stem and knotted branches. It seems probable, however, that other species, as well as this, supply part of the guaiacum wood and resin of commerce. At present they are obtained chiefly from Cuba, Jamaica, and St. Domingo. The wood is imported in billets about 3 ft. long and 1 ft. in diameter, of a greenish-brown color. This is the color of the heart-wood, the sap-wood is pale yellow. Guaiacum wood is remarkable for the direction of its fibers, each layer of which crosses the preceding diagonally; annual rings are scarcely to be observed, and the pith is extremely small. It sinks in water. It is much valued, and used for many purposes, chiefly by turners; ships' blocks, rulers, pestles, and bowls (see BOWLS) are among the articles most commonly made of it. When rubbed or heated, it emits a faint, disagreeable aromatic smell; its taste is also pungent and aromatic. Shavings and raspings of the wood are bought by apothecaries for medicinal use. The bark is also used in medicine on the continent of Europe, although not in Britain. The virtues of both wood and bark depend chiefly on the resin which they contain, and which is itself used in powder, pill, and tincture. It is an acrid stimulant, and has been employed with advantage in chronic rheumatism, in chronic skin diseases, in certain cases of scanty and painful menstruation (and hence it is occasionally an effectual remedy in cases of sterility), and in chronic catarrh. It has also been highly praised as a preventative of gout. The resin is an ingredient of the well-known *Plummer's pills*. In the 16th and 17th centuries, guaiacum was the remedy most in repute for syphilis. The resin sometimes flows spontaneously from the stem of the guaiacum tree; it is sometimes obtained artificially. It is of a greenish-brown color, and has a brilliant resinous fracture. It has scarcely any taste, but leaves a burning sensation in the mouth. One of its most striking characteristics is, that it is colored blue by its oxidizing agents. It contains *guaiacic acid* ($HO,C_{12}H_7O_5$), which closely resembles benzoic acid, and yields on distillation, certain definite compounds known as *guaiacine, pyroguaiacine,* and *hydride of guaiacyl*.

GUAICURÚS, Indians of Brazil, near the river and country of Paraguay. They are a hardy race, living mainly by raising cattle. They know little of agriculture, and subsist on fish and other animal food, and wild fruits. They have ranks of slaves, warrior, and a ruling caste. They have the hideous practice of deforming the under lip by inserting in it a piece of wood as large as the palm of a man's hand. The women are hardy, and assist in the chase and fishing.

GÚALEYGUACHÚ, a city in the Argentine republic, on the river of the same name, 120 m. n. of Buenos Ayres, in the province of Entre-Rios; pop. about 25,000. It stands on the right bank of the river, and is the center of export for the e. part of the province. A large trade is carried on in beef, hides, tallow, wood, and other animal products; and there are important salting and packing establishments in the vicinity, supplied by the vast herds and flocks of the region.

GUAM. See GUAHAN.

GUAMANGA. See HUAMANGA, *ante*.

GUAN, or YACOU (*Penelope*), a genus of large gallinaceous birds of the family *cracidæ*. They have a naked skin on the throat capable of being inflated or swollen, and a naked space around each eye. The name guan more particularly belongs to *penelope cristata*, a species of which the entire length is about 30 inches. It is a native of the forests of Brazil and Guiana, and has been long domesticated in South America. It has been found to endure the climate of Britain and of Holland so well, that hopes

are entertained of its becoming common in the poultry-yards of Europe. Its flesh is much esteemed.

GUANABACO'A. See HAVANA.

GUANACACHE, a lake or lagoon of the Argentine republic between the provinces of San Juan and Mendoza. It is rather a series of shallow lakes filled with small islands.

GUANACASTE, a province of Costa Rica between the bay of Nicoya on the s. and lake Nicaragua on the n.; a rough and thinly populated country. Though given to Costa Rica on the formation of the republic of Central America, Nicaragua still claims that the province belongs to her.

GUANACO. See HUANACA, *ante*.

GUANAHA'NI, or CAT ISLAND, one of the Bahamas, is generally regarded as Columbus's first discovery in the new world, being presumed to be identical with the San Salvador of the illustrious navigator. Recent criticism, however, appears to have transferred this honor to Watling Island (q.v.), which is about 50 m. to the e.s.e.

GUANAJUA'TO, or GUANAXUATTRO, an inland state of Mexico, in lat. between 20° and 22° n., and long. between 99° 40′ and 120° 40′ w., is bounded on the n. by the states of San Luis Potosi, on the e. by Queretaro, on the s. by Michoacan, and on the w. by Xalisco. It has an area of 11,400 sq.m., and a population in 1873 of 730,000. The surface, a portion of the lofty plateau of Anahuac, has an elevation of 6,000 ft. above sea-level, and is traversed by chains of mountains, among which those of Santa Rosa are porphyritic, and present elevations of 11,400 ft. in height. The state is watered by no river of consequence. The soil is fertile; maize, wheat, and frijoles (beans) are the chief grain crops raised; the vine, the *chili colorado*, or red pepper, and the olive, are also largely cultivated. Among the valuable mineral products of the state are silver, iron, lead, and copper, the first in the greatest abundance. The manufactures are woolens, cottons, leather, earthenware, and refined sugar. The climate is mild and pure. The population of the state divides itself into three races—25 per cent of the whole being whites, 39 per cent Indian, and 36 per cent mixed.

GUANAJUATO, or SANTA FÉ DE GUANAJUATO, a city of Mexico, capital of the state of the same name, is irregularly built on an extremely uneven district of hill and valley, in lat. 21° n., and long. 100° 50′ w. The streets are steep and tortuous, but the houses are generally well built, and have gayly painted outsides, green being the favorite color. It contains many fine public buildings, the chief of which are the cathedral, the monasteries (eight in number), the college, the gymnasium, the theater, and the mint. Guanajuato stands in a district in which, within a circuit of five leagues, there are upwards of 100 mines. Pop. 63,000.

GUANAPA'RO, a river of Venezuela, in South America, rises in the department of Caraccas, and, after an easterly course of 230 miles, joins the Portuguesa, which again, through the Apure, sends its tribute to the Orinoco.

GUANA'RÉ, a river of Venezuela, in South America, is an affluent of the Portuguesa, See GUANAPARO. On its banks are two towns, both of which derive their names from it: Guanarito, an inconsiderable place; and Guanare, a city of 12,000 inhabitants.

GUANCABELI'CA. See HUANCAVELICA.

GUANCHES, the name of the inhabitants of the Canary islands found there by the early European discoverers, reported to have been uncommonly tall and well shaped, with straight, dark hair. Before the 16th c. closed they had all disappeared. It is not known where they came from, but some suppose them to have been Libyans driven from Africa by the Moors.

GUA'NINE is a yellowish-white amorphous substance, which derives its name from its being a constituent of guano; it, however, also forms the chief constituent of the excrement of spiders, has been found attached to the scales of fishes—the bleak, for example—and seems to be a normal constituent of the mammalian liver and pancreas.

Guanine belongs to that class of bodies which were formerly called bases, but which, from their combining equally with acids, bases, or salts, are now often termed amides or amide-like compounds.

By oxidation with permanganate of potash, it is converted into urea, oxalic acid, and oxyguanine, a substance not yet sufficiently studied.

With regard to its occurrence in guano, as it has not been found in the recent excrement of sea-birds, there is every reason to believe that it is formed by slow oxidation (from atmospheric action) of the uric acid, much as uric acid can be made to yield urea and oxalic acid. And in the pancreas and liver it probably represents one of those transitory stages of disintegrated nitrogenous tissues which are finally excreted by the kidneys in the more highly oxidized form of urea.

GUA'NO (derived from the Peruvian word *huano*, dung) is the excrementitious deposit of certain sea-fowl, which occurred in immense quantities on certain coasts and islands where the climate is dry and free from rain. Although the use of guano as a manure is comparatively recent in this country and in Europe, its value in agriculture was well known to the Peruvians long before they were visited by the Spaniards. We learn from

the *Memoriales Reales* of Garcilaso de la Vega, published in 1609, that in the times of the Incas no one was allowed, under pain of death, to visit the guano islands during the breeding season, or, under any circumstances, to kill the birds which yield this substance; and that overseers were appointed by the government to take charge of the guano districts, and to assign to each claimant his due share of the precious material. Alexander von Humboldt first brought specimens of guano to Europe in 1804, and sent them to Fourcroy, Vauquelin, and Klaproth, the best analytical chemists of the day.

Mr. Nesbit, in a useful little pamphlet entitled *The History and Properties of the Different Varieties of Natural Guano*, remarks that the quality and value of these manures, commercially, depend almost wholly upon the amount of decomposition to which they have been subjected by the action of the atmosphere. The fæcal matter of the fish-eating birds, which, by its long accumulation, forms the guano deposits, consists essentially of nitrogenous and phosphatic compounds, the former being chiefly ammonia salts derived from the decomposition of the uric acid and urates which exist in the fresh excrements of these birds. The ammoniacal portion of these deposits, and some of the phosphates, are tolerably soluble in water, and are readily washed away by rain. The late prof. Johnston remarked, that "a single day of English rain would dissolve out and carry into the sea a considerable portion of one of the largest accumulations, and that a single year of English weather would cause many of them entirely to disappear." In dry climates, where very little rain falls, as in some parts of Bolivia and Peru, on the western coast of South America, the dung deposited suffers very little from the action of the atmosphere, and retains nearly the whole of its soluble nitrogenous and phosphatic compounds. Guanos, on the other hand, found in regions where rain falls freely, lose a great part of their soluble constituents, but remain rich in their less soluble constituents—the phosphates of lime and magnesia. Mr. Nesbit divides guanos according to their composition, into three classes: 1. Those which have suffered little by atmospheric action, and which retain nearly the whole of their original constituents, such as the Angamos and Peruvian guanos. 2. Those which have lost a considerable portion of their soluble constituents, such as the Ichaboe, Bolivian, and Chilian guanos. 3. Those which have lost nearly all their ammonia, and contain but little more than the earthy phosphates of the animal deposit. Many of these are largely contaminated with sand. In this class we place the various African guanos (excepting that from Ichaboe), West Indian guano, Kooria Mooria (islands off the coast of Arabia) guano, Sombrero guano, Patagonian guano, Shark's bay guano (from Australia), etc.

Most of the so-called Peruvian guano has been obtained from the Chincha islands, which are three in number, and are situated about 12 m. off the coast of Peru, between 13 and 14 degrees s. lat. Each of these islands is from 5 to 6 m. in circumference, and consists of granite covered with guano, in some places to a height of 200 ft., in successive horizontal strata, varying in thickness from 3 in. to a foot, and in color from a light to a dark brown. Sometimes, however, is found a vertical surface of upwards of 100 ft. of a perfectly uniform appearance. If Humboldt's statement is correct, that "during 300 years the coast-birds have deposited guano only a few lines in thickness," the extreme age of the lower strata becomes at once obvious.

The following table represents the mean of 78 samples of Peruvian guanos, analyzed by Mr. Way:

Moisture	13.67
Organic matter and salts of ammonia	52.05
Earthy phosphates	22.78
Alkaline salts containing 3.34 phosphoric acid, and equal to 6.89 soluble phosphate of lime	9.67
Sand, etc.	1.83
	100.00
Ammonia, per cent.	16.52

The following, from Muspratt's *Chemistry* gives the mean of several analyses of the inferior kinds of guano, the first four belonging to Nesbit's second class, and the remaining three to his third class:

	Ichaboe.	Ichaboe.	Chilian.	Bolivian.	Patagonian.	Kooria Mooria.	Saldanha Bay.
	Earlier cargoes.	Recent cargoes.					
Moisture	27.3	20.0	20.4	10.0	25.0	18.1	20.0
Organic matters and salts of ammonia	34.3	24.4	18.6	21.6	18.3	12.4	14.9
Earthy phosphates	30.3	20.4	31.0	51.5	44.0	42.7	56.4
Alkaline salts	5.0	6.2	7.3	14.1	2.1	4.2	5.8
Carbonate of lime						4.1	
Sand, etc	3.1	29.0	22.7	2.7	10.6	18.5	2.9
	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Ammonia per cent.	7.3	6.0	5.47	4.5	2.5	2.05	1.47

The nitrogen in these analyses is calculated as ammonia for the purpose of comparison. In reality, it exists in various forms of combination—viz., as uric acid, urea occasionally, urate, oxalate, hydrochlorate, phosphate, etc., of ammonia, other urates, guanine (q.v.), and undefined nitrogenous compounds. Hence, as may be inferred, a complete analysis of guano is a work of very considerable labor; but as its agricultural value depends mainly on the quantities of ammonia, soluble and insoluble phosphates, and alkaline salts, which it contains, such analyses as those we have given are sufficient for practical purposes, and they are easily made.

As good Peruvian guano sold long at from £11 to £13, and latterly at about £14 per ton, there was a strong inducement to adulterate it. Umber, powdered stones, various earths, partially decomposed sawdust, and other substances, were used for this purpose, and specimens have been sold containing mere traces of the genuine article. Hence it is expedient that large purchasers should either send a sample to a good chemist for analysis, or should cork up or retain a small quantity in a bottle for analysis, provided the crops to which he has applied his guano do not answer reasonable expectation. A chemist is attached to most agricultural societies and clubs, who performs such analyses for a moderate fee. The numerous analyses of prof. Anderson, late chemist to the Highland society, and of other chemists, have had a very material effect in checking the sale of adulterated guano in Scotland. Still, the adulteration of manure, has for some time been rather more common in Scotland than in England. True, guano is not so often adulterated as some other fertilizers; but in England, the rigorous measures adopted by Dr. Voelcker and the royal agricultural society to expose dealers in spurious articles, and to suppress such traffic, have had a very beneficial effect. In Scotland, the agricultural public awakened to the magnitude of the question. Several district analytical associations have been formed throughout the country. With all this machinery in full play, the fraudulent dealer will fortunately find his avocation as stiff work in Scotland as he has latterly discovered it in England.

Such facilities for analysis will to a considerable extent supersede the following ancient yet simple modes of testing the quality of guano. A pretty good idea, however, can be formed of the superiority or otherwise of the samples of guano by these tests:

1. *Test by Drying.*—If the guano, as is generally the case with the Peruvian and Chili varieties, is a uniform powder, weigh out two ounces, spread it on paper, and let it lie for two days in a dry and moderately warm room. What it may then have lost in weight must be esteemed superfluous water. Many sorts of guano are so moist as to lose 20 or 25 per cent of their weight by this gentle drying. If we wish to determine the water with greater accuracy, a smaller quantity of guano should be placed in a shallow platinum capsule, and moistened with a few drops of hydrochloric acid. A heat of 212° may then be applied without loss of ammonia.

2. *Test by Combustion.*—Pour half an ounce of the guano into an iron ladle, such as is used for casting bullets, and place it upon red-hot coals, until nothing but a white or grayish ash is left, which must be weighed after cooling. The best sorts of Peruvian guano do not yield more than 30 or 33 per cent of ash, while inferior varieties, such as Patagonian, Chili, and African guano, leave a residue of 60, or even 80 per cent; and those which are intentionally adulterated, may leave a still larger residue. Genuine guano of all kinds yields a white or gray ash; and a yellow or reddish ash indicates the adulteration with earthy matter, sand, etc.

This test is based upon the fact, that the most important ingredients, viz., the nitrogenous compounds, become volatilized, and escape, when subjected to a sufficient amount of heat. The difference of odor of the vapors evolved in the process, according as we are working with first or third rate guano, must also be noticed. The vapors from the better kinds have a pungent smell like spirits of hartshorn, with a peculiar piquancy somewhat resembling that of rich old decayed cheese; while those rising from inferior varieties smell like singed horn-shavings or hair.

3. The *lime test* affords a ready means of roughly determining the relative quantities of ammonia in different specimens of guano. Put a teaspoonful of each kind of guano, and an equal quantity of slaked lime, into a wine glass; then add two or three teaspoonfuls of water, and mix the substances together with a glass rod. Lime being a stronger base than ammonia, liberates the latter from the ammonia salts contained in the guano; and the better the guano is, the stronger will be the pungent ammoniacal odor which escapes from the mixture. The slaked lime should be preserved in a dry and well-corked bottle, so as to exclude the air.

4. The *hot-water test* affords a simple means of determining the goodness of guano. We may either boil half an ounce of dried guano in 5 or 6 oz. of water, and filter the solution while hot, or we may place the guano on a filter, and continue to pour boiling water over it, until the drops that come through the filter cease to yield any residue when heated to dryness on a glass slip held over the spirit-lamp. As a general rule, the larger the quantity of guano that is dissolved in hot water, the more ammonia salts does it contain, and the better it is. In the best or Peruvian guano, the insoluble residue ranges from 50 to 55 per cent, while in the inferior varieties it may amount to 80 or 90 per cent.

5. The *acid test* serves to detect the chalk which occurs in the Kooria Mooria guano,

and is used as an adulteration for other varieties. Mix the powdered guano with a little water, and add a little hydrochloric acid or strong vinegar. If chalk is present, effervescence from the liberation of carbonic acid occurs.

6. The *weight* affords the easiest test for the purity of guano. According to prof. Anderson, a bushel of pure Peruvian guano should not weigh more than from 56 to 60 lbs.; but according to most authorities it should weigh almost exactly 70 lbs. If heavier than 73 lbs., it is adulterated with clay, marl, sand, or some other impurity.

If the value of a manure be calculated, as is done by Boussingault and other chemists, according to the amount of nitrogen which it contains, one ton of good Peruvian guano is equal to 33½ tons of farmyard manure, 20 tons of horse-dung, 38½ tons of cow-dung, 22½ tons of pig-dung, or 14½ tons of human excrement.

When we consider what guano is—viz., that being the more or less decomposed excrement of fish-eating birds, it consists essentially of the ash constituents of the flesh of fish, together with ammonia salts—we need not wonder that its application to the land as a manure should so largely increase its productiveness, "for guano," says Liebig, "contains not only the mineral elements which a soil must possess to produce corn, but also in the ammonia an indispensable element of food which serves to quicken their action, and to shorten the time required for their assimilation. On many fields, the ammonia in the guano may, if the weather prove propitious, possibly affect the assimilation of double the ordinary quantity of these mineral constituents, and thus render the amount of produce yielded in one year equal to what would have been otherwise obtained in two years by these mineral matters alone."

The introduction of guano into this country as a manure is comparatively recent. In 1840 only 20 casks of it were imported. In 1841 the earl of Derby—then lord Stanley—spoke strongly in its recommendation at the Liverpool meeting of the royal agricultural society of England; and from that time it has come rapidly into use, as may be seen by the following table of imports:

Years.	Tons.	Years.	Tons.
1841	2,881	1852	129,889
1842	20,398	1854	235,111
1843	30,002	1855	305,061
1844	104,251	1857	288,362
1845	283,300	1858	353,541
1846	89,203	1859	84,122
1847	82,392	1860	141,435
1848	71,414	1865	257,393
1849	83,438	1867	192,308
1850	116,925	1870	280,311
1851	243,014	1877	152,989

As the chemical composition of natural guano is known, an artificial guano may be readily compounded by the admixture, in due proportions, of its constituents. The following mixture, recommended by the late prof. Johnston, forms one of the best imitations of guano, 132½ lbs of it being equal in power to 1 cwt. of good Peruvian guano: Mix 78¾ lbs. of bone-dust, 25 lbs. of sulphate of ammonia, 1¼ lbs. of pearl-ash, 25 lbs. of common salt, and 2½ lbs. of dry sulphate of soda. All these materials, excepting the bone-ash, may be procured from any druggist.

Guano was largely used for all the cultivated crops on the farm, and is yet, as far as it can be procured. Being a high-priced, but concentrated and powerful fertilizer, in ordinary farm-management it is applied with more economical results to some crops than to others. On grasses proper, it is sown broadcast in the early part of spring, when vegetation begins to start. At this time the roots take it up, and prevent it from being washed out of the soil. Clover, on the other hand, being a deep-rooted plant, is supposed by some to be best dressed with it in autumn, before vegetation is stopped for the season. The roots store up the active principles of the manure till spring, and the plants are in a far more vigorous state for the summer growth. From two to three cwts. of guano per acre is the common allowance for grasses intended to be cut for hay, but the Italian variety of ryegrass will sometimes bear a large quantity with beneficial results. Guano is rather too soluble to be applied to early autumn sown wheat. It both stimulates the plant too much before winter, and is apt to be partially washed out of the soil with the winter rains. In moist springs, when there are abundance of rains to wash it in, guano forms an admirable top-dressing for winter wheat. For spring sown wheat, and other cereals, no manure has a more powerful influence. The closer that it is put to seed, the better. The common dressing is from three to four cwts. to the acre for cereals. It should be kept in mind, in regulating the quantity, that the stronger the land is, the larger the quantity that can be applied with a prospect of yielding a profit. The same principle should be observed in its use for the turnip crop. As much as from four to six cwts. may sometimes be beneficially applied to early sown turnips on deep and able soils, while two to three cwts., when farmyard manure is given, will in general prove the most economical quantity. Guano is apt to produce too much heat when it is applied in large quantities to late sown turnips, and to prevent the formation of bulbs. In such circumstances, phosphoric manures will often

yield better crops at less expense. When guano is applied to beans or potatoes, they should be also dressed with farmyard manure. Guano does not possess the power of sustaining the healthy growth of these plants on most soils without something else in addition.

Mixed with rough bones, guano is valuable, applied above dung for turnips, and a great deal of it has been so used. Its value as a fertilizer was so highly appreciated, and its use so extensive, that farmers got not a little alarmed and disappointed at the diminution of the genuine Peruvian guano supplies. Agriculturists of necessity betook themselves of late to various artificial substitutes for Peruvian guano, but the results are not generally so satisfactory. Farmers learned, in the spring of 1874, with satisfaction, of the discovery of new guano deposits on the coast of Peru. For the Peruvian government, Mr. M. H. Thierry explored the new deposits, and he estimated the total quantity at 7,500,000 tons. Of seven different places mentioned as containing that deposit, Pabellon de Pica, having 5,000,000 tons, is the principal. Careful analyses made of the new guano on behalf of the government proved it equal in quality to the guano of the Chincha islands.

GUANO, a t. in the province of Chimborazo, Ecuador, 100 m. s.w. of Quito; pop., about 9,000. It has considerable manufactures of woolens, blankets, carpets, etc., and much Peruvian bark is exported.

GUANO ISLANDS. Besides the Chincha islands, on the coast of Peru, there are in the western Pacific numbers of low coral islands which are guano-producing. They are in lat. 3° and 4° s., and long. 155° and 174° west. They are frequented by the usual varieties of tropical birds, and afford large though decreasing quantities of the fertilizing deposit.

GUANONIEN. Under this name, Du Chaillu, in his second volume of travels, entitled *A Visit to Ashango Land*, mentions a great bird of prey, inhabiting the tropical parts of western Africa, hitherto unknown to naturalists, which he thinks may probably rival in size the condor of South America. He failed, however, in all endeavors to procure a specimen, the bird being apparently very wary. He regards it as an eagle, and not as a vulture, and its habits show this conjecture to be probable. The traveler says: "Several times I have been startled in the forest by the sudden cry of anguish of a monkey who had been seized by this 'leopard of the air,' as the natives often call it, and then saw the bird, with its prey, disappear out of sight." On one occasion, he saw a nest of this bird at the top of a gigantic tree, but the young had flown away. At the foot of the tree lay more than 100 skulls of monkeys, of different sizes, some of which must have been formidable animals.

GUAPEY', a river of South America, rises in Bolivia, and joins the Mamore on its way to the Amazon, after a winding course of 550 miles.

GUAPO'RÉ, a river of South America, rises in Brazil, and, after a course of 400 m., unites with the Mamore to form the Madera, an affluent of the Amazon.

GUARA'NA, an article usually dissolved in water as a beverage, or mixed with food; used by the South American Indians. It is astringent and not unpleasant to the taste. It has been used also as a remedy for sick-headache, but although sometimes appearing to afford relief, its efficacy is doubtful. The article is made from the seeds of the *Paullinia sorbilis*, a Brazilian shrub of the order *sapindaceæ*. The dried seeds are reduced to powder, and mixed into a stiff paste and rolled into cylinders, which are then dried, forming a hard brownish mass. The essential crystallizable principle is said to be identical with caffeine, but has received the name of guaranine.

GUARA'NA BREAD is a kind of food prepared by the savages of Brazil from the seeds of a plant supposed to belong to the genus *Paullinia* (natural order *sapindaceæ*), and which has been called *P. sorbilis*. It is in round or oblong cakes, which are regarded in all parts of Brazil as very efficacious in the cure of many disorders, and which contain, besides other substances, some of them nutritious, a considerable quantity of a substance supposed to be identical with theine or caffeine. The Brazilians pound the guarana bread in water, sweeten it, and use it as a stomachic and febrifuge. It is also reputed aphrodisiac.—The genus *Paullinia* contains several species remarkable for their extremely poisonous properties.

GUARANTY, in international law, is where a third nation or potentate guarantees that a party to an international agreement will fulfill its conditions. Such guaranty does not amount to surety, but is only a promise by a third party to use the best efforts to bring about the fulfillment of the agreement in question.

GUAR'ANTY, or **GUARANTEE**, is a contract by which one person binds himself to pay a debt or do some act in case of the failure of some other person, whose debt or duty it is to do the thing guaranteed. The person so binding himself is generally called the surety in England, while the person who is primarily liable is called the principal. Thus, where A borrows money, and B joins as a party in a bill of exchange or a bond to secure the loan, B is a surety. Where B guarantees that certain goods which are supplied to A shall be paid for, he is more usually styled a guarantor than a surety, but the liability is the same.

Such a contract must be in writing, for the statute of frauds (29) Charles II. c. 3) required that no action should be brought whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person, unless the agreement or some memorandum or note thereof should be in writing and signed by the party to be charged therewith, or some other person by him lawfully authorized. So that a surety can only be bound by some writing signed by himself or his agent. And lord Tenterden's act (9 Geo. IV. c. 14, s. 6) enacted the same thing as to persons making representations as to the character, ability, or dealings of another, with intent that the latter may obtain credit. In order to bind the surety, there must also be no deceit or misrepresentation used as to the nature of the risk or as to the state of the accounts. If a guaranty is given to a firm, it is not binding after a change in the firm, unless the parties expressly stipulate to the contrary. If the creditor discharge the principal, or even give time, by way of indulgence to him, the surety is released, for he is thereby put to a disadvantage. In general, the creditor can sue either the principal or the surety for the debt at his option. If the surety is obliged to pay the debt of his principal he can sue the principal for the money so paid, and is entitled to have all the securities assigned to him, so as to enable him to do so more effectually.

In Scotland the law is substantially the same as regards principal and surety, or, as they are there called, principal and cautioner; but there are some minor differences, though many of the differences which formerly existed between the laws of the two countries were swept away by the statutes 19 and 20 Vict. c. 97, and 19 and 20 Vict. c. 60. The chief differences now are, that in Scotland it is not necessary to prove any consideration for the contract, though the contract is not by deed; that liability of the surety continues seven years, whereas in England it continues generally only six years —and that the discharge of the surety can be proved only by the writ or oath of the creditor, whereas in England it can be proved by oral evidence. See Paterson's *Comp. of E. and S. Law.*

GUARATINGUETA, a t. in Brazil on the river Parahyba, 120 m. w. of Rio Janeiro; pop. estimated, 7,000.

GUARDAFUI', CAPE (anc. *aromatum promontorium*), the most eastern point of the African continent, and the extremity of an immense promontory stretching seaward in an e.n.e. direction, and washed on the n.w. by the gulf of Aden and on the s.e. by the Indian ocean. The cape is in lat. 11° 50′ n., long. 51° 20′ east.

GUAR'DIA-GRE'LÉ, a small and unimportant t. of s. Italy, in the province of Chieti, 12 m. s.s.e. of the town of Chieti. Pop. 8,776.

GUARDIAN, in English law, is the legal representative and custodier of infants, i.e., persons under the age of 21, and various species are distinguished. Guardian by nature is rather a popular than a legal term, especially when used in reference to a father or mother, who are often called guardians by nature. In its technical sense, it is confined to an ancestor who is said to be guardian of his heir-apparent. *Guardian for nurture* is the name given to a father, or, after his death, to the mother, who, as such, has the custody and control of children until the age of 14. *Guardian in socage* is the term anciently given to the next of blood who had the legal custody of the person as well as estate of the heir to lands which descend in socage or freehold, until the heir attains the age of 14. A father may, by deed or will, appoint a guardian to his child. If he do not, the lord chancellor will do so; but practically, this is only done when the child is entitled to property. When a guardian is appointed by the chancery division of the high court of justice, the infant is called a ward of court, and requires the sanction of the guardian for most purposes, and requires the permission of the court to marry, or if the infant marries without such permission, those who were privy to such a contempt of court may be punished. A *guardian ad litem* is a person (usually the father, if alive) appointed by the chancery division for the purpose of carrying on a suit in the name of an infant. In general the power of a guardian extends to the person as well as the property of the infant; but in the case of guardians appointed by chancery, their powers are under the strict control of that division.

The guardian of a lunatic (q.v.) is usually called a committee. In Scotland the word "guardian" is sometimes used in reference to lunatics, but seldom applied, except in a popular sense, to those who have the custody and care of children. In corresponding cases in Scotland, the custody of a child under 12, if female, or 14, if male, belongs to her or his tutor (q.v.); and from those ages to 21, the child has no legal guardian, being *sui juris;* but the care of the child's property belongs to a curator (q.v.).

Guardian of the poor is in English parochial law an important functionary, being a person elected by a parish or union of parishes to manage the affairs of the poor. The ancient officers of the parish who attended to the affairs of the poor were called overseers; but by statutes, most of which are recent, it has been thought better to have a larger body of persons elected by the ratepayers of the parish to discharge most of these duties. Hence, many of the larger parishes are, either by a special statute or by order of the poor-law board, put under a board of guardians, and all poor-law unions are managed by guardians also. The ratepayers, in voting, have one vote for each £50 of rent they pay, but in no case are allowed more than six votes. The guardians have the management of the workhouse, and the maintenance, clothing, and relief of the

poor, and in the regulations must comply with the orders of the local government board, whose president is a member of the government, acting by these orders and by statutes. The office of guardian is compulsory, but may be refused, if notice is given during the election.

In Scotland the corresponding duties are discharged by the parochial board (q.v.), which is subject to the general board of supervision. See also POOR.

GUARDIAN (*ante*), one who has lawful care and management of the person, or estate, or both, of an infant during its minority. A guardian by chancery in the United States resides in courts of equity and probate or surrogate courts. The father is guardian by nature, and after his death the mother takes his place. The mother of a bastard is the natural guardian. Guardians by statute are those appointed by deed or will, or those appointed by a court. Testamentary guardians, or those appointed in a will, supersede all others, and have full control of person aud estate until the child arrives at full age. The great majority of guardians are appointed by courts, and their powers are regulated by statute or by common law. Where a mother is living the court need not appoint a guardian. At the age of 14 a minor has a right to choose a guardian, but for sufficient reason the court may disapprove the choice, and the person may then choose again. If a minor has a guardian appointed by a court he may, on arriving at the age of 14, choose another guardian with notice to the one first appointed. A wife may be a guardian, but must have the consent of her husband. The powers and liabilities of guardians (and of wards) are very closely defined by statutes and by the common law.

GUARDIAN ANGEL. This term has long been used to express the idea that human beings are under the special care and protection of certain angels. The notion is supposed to find authority in the words of Christ, Matt. xviii. 10; also in Heb. i. 14.

GUARDS are in all armies the *élite* of the troops, and usually those most heavily armed. In the British service, the guards constitute, in time of peace, the garrison of London, and the guard of the sovereign at Windsor. The guards compose what is called the household brigade, and include in cavalry the 1st and 2d life guards, and the royal horse guards (blue) and in infantry, the grenadier guards, the coldstream guards, and the Scots fusilier guards. These distinguished corps comprise 1302 cavalry in three regiments, and 5,940 infantry in seven battalions. Before the abolition of purchase, the officers of the regiments of foot guards held higher army rank than that they bore regimentally; that is, ensigns ranked with lieutenants of other regiments, lieutenants with captains, captains with lieutenant-colonels; and on exchanging into the line, they were thus enabled to exchange into the higher positions, a circumstance which often placed officers of comparatively short service over veterans of the line, and caused, perhaps, more heart-burning than any other anomaly among our regulations. When purchase was the rule, every officer in the guards was quite ready to accede to it; when it was abolished in 1871, this exceptional rank was also abolished in regard to all officers newly entering the guards.

GUARDSHIP, the ship of war in charge of a port. She generally acts also as a depot for seamen raised there until appropriated to other vessels, and her captain is responsible for the safety and proper preservation of the men-of-war which may be laid up—out of commission in the harbor. The superintendent of a dock-yard, if a flag-officer, carries his flag at the mast-head of the guardship; if he be only a captain, the guardship is usually under his nominal command, although the actual duties are carried on by the commander or next senior officer.

GUAREA, a genus of tropical American trees of the natural order *meliaceæ*, of some of which the bark is used as an emetic and purgative. *G. grandifolia* is called MUSKWOOD in some of the islands of the West Indies; the bark smelling so strongly of musk, that it may be used as a perfume.

GUARI'NI, GIOVANNI BATTISTA, a popular and elegant poet, was b. at Ferrara in 1537. At the termination of his studies in the universities of Pisa, Padua, and Ferrara, he was appointed to the chair of literature in the latter, and soon after, the publication of some sonnets obtained for him great popularity as a poet. At the age of 30 he accepted service at the court of Ferrara, and was intrusted by duke Alfonso II. with various diplomatic missions of delicacy and importance. Differences between him and the duke induced him to withdraw from the court of Ferrara about the year 1587. Having resided successively in Savoy, Mantua, Florence, and Urbino, he returned to his native Ferrara, and discharged one final public mission, that of congratulating pope Paul V. on his election to the tiara. He died in 1612 at Venice, whither he had been summoned to attend a lawsuit. An irascible sensitiveness, joined to an exaggerated estimate of his personal dignity, neutralized many qualities both brilliant and solid, which seemed to fit Guarini exactly for a court career. To these defects, in part, may be attributed the frequent mortifications which tracked him through life. As a poet, he is remarkable for refined grace of language and sweetness of sentiment, while his defects are occasional artificiality, a too constant recurrence of antithetical imagery, and an affected dallying with his ideas. His chief and most popular work, *Il Pastor Fido* (The Faithful Swain), is regarded in Italy as a standard of elegant pastoral compo-

sition, and obtained a high measure of popularity on its appearance. The writer designed it as a tragi-comic pastoral; its first dramatic representation was in honor of the nuptials of the duke of Savoy and Catherine of Austria, 1585. It subsequently ran through forty editions during Guarini's life, and was translated into almost all the modern languages. Tasso and Guarini have been frequently compared; the two poets were literary friends and reciprocal admirers, although rivals in love. Guarini's varied writings, including sonnets, comedies, satires, and political treatises, were published at Ferrara in 1737, 4 vols. 4to.—See *Storia della Letteratura Italiana del Tiraboschi.*

GUARINO (Lat. *Varinus*), a learned Italian, b. at Verona in 1370, went to Constantinople in 1388 to learn Greek under Chrysoloras. After his return he taught in Verona, Padua, and Bologna, was tutor to prince Lionella of Ferrara, acted as interpreter at the council of Ferrara, and died in 1460. He performed great services for the revival of classical studies; translated the first ten books of Strabo, and a portion of Plutarch; commented on Cicero, Persius, Juvenal, Martial, and Aristotle; and wrote a *Compendium Grammaticæ Græcæ*, which was printed at Ferrara in 1509.—Compare Rosmini, *Vita e Disciplina di Guarino* (3 vols. Brescia, 1805–6).

GUARNERI, or GUARNERIUS, a noted family of violin makers of Cremona, Italy. ANDREA, b. 1630, was a pupil of Nicolò Amati, whose work he to some extent imitated. GIUSEPPE, son of Andrea, was an imitator of Stradivarius. PIETRO, another of Andrea's sons, did work much inferior to that of his father. GIUSEPPE ANTONIO, b. 1683, a nephew of Andrea, was a pupil of Stradivarius, and the most celebrated of the Guarneri family. His work was variable, but when at his best, it is doubtful if he had a superior. He was, however, irregular in his life, trifling, and intemperate.

GUASTALLA, a walled t. in n. Italy in the duchy of Modena, the capital of a small district; pop. 10,618. It is on the river Po, 16 m. n. of Reggio; is a bishop's see, and has a cathedral and a public library. There are manufactures of silk.

GUATEMALA, nominally a republic, but really an oligarchic state of Central America, terminates this division of the new continent towards the n.w., being washed at once by the Caribbean sea and the Pacific ocean. It stretches in n. lat. from about 14° to 17°, and in w. long. from 88° to 93°, containing 40,620 sq.m., and 1,190,750 inhabitants. The surface presents great variety, mountains and valleys, plains and table-lands. The different levels, ranging from the sea-shore to an elevation of 5,000 ft., have each its own climate and temperature. The country is subject to earthquakes, and abounds in active volcanoes. Being nearly as populous as all the other states of Central America put together, Guatemala popularly gave name, in the early days of independence, to the confederation which they temporarily formed; and, from the same pre-eminence, it had given name, under the Spanish domination, to a still more extensive region. The government is in the hands of a president elected for four years, with a council of state and a house of representatives. Formerly the president was elected for life, and under Rafael Carrera (1854–65) the government was carried on in the interest of a dissolute aristocracy and a debased priesthood. The banished Jesuits were recalled, the convents re-established, etc. Now a different order of things prevails. A new code of laws has been drawn up; the monastic order has been wholly suppressed; and, though the Roman Catholic is the established religion, others are tolerated. In 1874 the imports and the exports respectively amounted to £610,801 and £657,744, the trade with Great Britain, partly direct and partly through Balize, comprising two-thirds of the former, and nearly three-fourths of the latter. The chief articles imported were cottons, silks, woolens, hardware, ironmongery, linens, and jewelry; and the chief articles exported were cochineal, indigo, sugar, hides, country manufactures, sarsaparilla, and mahogany. Formerly, cochineal was the principal export, in worth more than doubling all the others put together; but of late years, owing to a disease among the cochineal insect, coffee has been the staple.

GUATEMALA (*ante*). The physical features of Guatemala which are of the most practical interest, are its fine rivers, some of which are navigable to near their head-waters, and its lakes which furnish agreeable and salubrious sites for thriving villages. The geology of the country displays some mineral wealth, lead and coal being found in large quantities, while marble quarries and deposits of lithographic stone also are worked to some extent. There are but few animals in Guatemala that are dangerous to man, while it abounds with the usual tropical species, including monkeys, the tapir, the armadillo, honey-bear, etc., besides vast numbers of birds, many of them of brilliant plumage. There are said to be 36 species of humming-birds, 13 of woodpeckers, and 8 of trogons, including in the latter class, the *quetzal*, whose splendid yellow tail-feathers, 2 ft. in length, were used formerly as insignia by the Indian princes, and now form an emblematical figure in the arms of the republic. Alligators, snakes, salamanders, toads and frogs abound, and there is a rich development of insect life. The native products include more than 100 varieties of timber trees; cocoa is grown in the n.w; there is some good tobacco raised, but in small quantities; and vanilla, aloes, rhubarb, ipecacuanha, castor-oil, and colocynth are all indigenous, and only need the intervention of foreign capital to become the material of a valuable export trade. Guatemala is divided into 20 departments, of which that of Guatemala proper is the most populous. Of the

entire population of 1,200,000, 720,000 are Indians, 300,000 Ladinos, and 180,000 whites. In 1874 the number of foreigners was only 829, of whom 191 were Mexicans, 164 Spaniards, 103 Frenchmen, 71 Italians, 64 Germans, and 50 Englishmen. The means of transportation and communication are very imperfect, 1,365 miles of road, with 432 bridges, and one unfinished railroad, and about 400 miles of telegraph being the entire service of this nature in 1874. Guatemala was, in ancient times, the seat of an extended and developed civilization, relics of which exist in numerous mounds, ruins, colossal heads, idols, pillars and altars. Until about 1824, when the Central American confederation was formed, Guatemala was under the Spanish rule. From 1827 to 1851 it was controlled by Honduras and San Salvador. In the latter year Carrera defeated the Hondurians and San Salvadorians at La Arada, and was rewarded by being made president of the republic, a dignity which was in 1854 extended to him for life: his death occurred in 1865, and he was succeeded by gen. Cerna, who was deposed in 1871. In 1872 gen. Bavrios was elected president, and four years later he endeavored to bring about the consolidation of the Central American republics. The effort failed, and a war ensued between Guatemala, Honduras and San Salvador, out of which Guatemala emerged victorious.

GUATEMA'LA, the name of two cities in Central America.—1. Guatemala (old) stands at the foot of Volcan de'Agua, in lat 14° 30′ n., and long. 90° 45′ w. Once the capital of the country, it was twice destroyed, first in 1541, by an eruption, and again in 1773, by an earthquake. Though, after the second disaster, it was supplanted by its more modern namesake, yet it was, to a certain extent, rebuilt. It numbers about 20,000 inhabitants; and many of its ancient buildings, more especially a cathedral, and a palace, remain entire.—2. Guatemala (new), capital of the republic of the same name, is situated in a rich and spacious table-land, at an elevation of 4,961 ft. above the sea, in lat. 14° 37′ n., and long. 90° 30′ west. It is 24 m. to the e.n.e. of the original capital. Population estimated at 45,000. The people manufacture muslins, cotton-yarn, plate, artificial flowers, and beautiful embroidery, carrying on at the same time a prosperous trade in the agricultural productions of the neighborhood. The place is well supplied with water by an aqueduct.

GUATEMOZIN, 1495–1525; son-in-law and nephew of Montezuma, and the last of the Aztec rulers of Mexico. He came to the throne in 1520 just as the Spanish invaders who had been repulsed by Montezuma were preparing another attack. April 28, 1521, the siege of the city of Mexico was begun, and the defenders suffered terrible tortures. The emperor was urged to escape, and tried to do so, but was captured. Cortes was at first disposed to be humane, but finally submitted to the clamor of his soldiers for plunder, and allowed the fallen emperor to be tortured by roasting his feet at a slow fire. He bore the infliction heroically, and the plunderers gained no information concerning the treasure they were after. The emperor was kept a prisoner and with that refinement of cruelty peculiar to the chivalrous Spaniard of the period, Cortes took him along in his raids to compel him to witness the outrages committed upon his people. Finally, on a charge of conspiracy to assassinate the Spanish leader (of which there was not a shadow of proof) Guatemozin and some others were executed.

GUATUSOS, a small tribe of Indians living along the Rio Frio in Costa Rico, supposed by some to be legitimate descendants of the Aztecs, as they have fair complexions and reddish hair. They are extremely reserved, and no white men, not even the persistent Roman Catholic missionary, has explored their country.

GUA'VA (*psidium*), a genus of trees and shrubs of the natural order *myrtaceæ*, mostly natives of tropical America, and some of them yielding fine and much valued fruits. They have opposite entire, or almost entire leaves, a 3 to 5-lobed calyx, 4 to 5 petals, and a 1 to 5-celled berry with many-seeded cells.—The COMMON GUAVA or WHITE GUAVA (*P. pyriferum*) is a low tree of 7 to 20 ft., with numerous branches, obtuse smooth leaves 2 to 3 in. long, and fragrant white flowers on solitary axillary stalks. It is said to be a native both of the East and West Indies, and is now much cultivated in both. It is not improbable, however, that it was introduced into the East Indies from America, but it has now become fully naturalized. Sir James E. Tennent says, it is to be seen in the jungle around every cottage in Ceylon. It has long been occasionally grown as a stove-plant in Britain. The fruit is larger than a hen's egg, roundish or oblong, smooth, yellow; the rind thin and brittle; the pulp firm, full of bony seeds, flesh-colored, aromatic, and sweet. The jelly or preserve made from it is highly esteemed, and is now regularly imported into Britain from the West Indies and South America. The rind is stewed with milk, and is also made into marmalade. This fruit is rather astringent than laxative. Guava buds, boiled with barley and liquorice, make a useful astringent drink in diarrhea. —The RED GUAVA (*P. pomiferum*), also now common in the East as well as in the West Indies, produces a beautiful fruit, with red flesh, but not nearly so agreeable as the white guava. It is very acid. The CHINA GUAVA (*P. cattleyanum*), a native of China, produces fruit readily in vineries in Britain. It is a larger tree than the white guava. The fruit is round, about the size of a walnut, of a fine claret color, growing in the axils of the leaves; the pulp purplish red next the skin, becoming paler towards the center, and there white, soft, subacid, and of a very agreeable flavor. It makes an excellent preserve. It succeeds in the open air in the s. of France.—On some of the mountains of

Brazil grows a dwarf species of guava, called marangaba (*P. pygmæum*), a shrub 1 to 2 ft. high, with fruit about the size of a gooseberry, much sought after on account of its delicious flavor, resembling that of the strawberry.—The BASTARD GUAVA of the West Indies is a species of *Eugenia* (q.v.).

GUAXA'CO. See OAJACO.

GUAYAPE, a stream in Honduras, one of the affluents of the Patuca. For centuries the former stream has been famous for rich gold washings which the natives work in the rudest manner.

GUAYAQUIL', a term of various application in Ecuador, South America, indicates at once a river, a bay, a department, and a city.—1. The river is the only stream on the western coast of South America, which can, without qualification, be said to be navigable for sea-going vessels. It is navigable for about 110 m. to Caracol, and is known in its upper course successively as the Caracol and Babahoyo.—2. The bay which receives the river, stretches in s. lat. between 2° and 4°, and in w. long. between 80° and 81°. It receives also the Daule and the Tumbez.—3. The department extends from the Pacific on the w. to the departments of Quito and Assuay on the e., comprising a much wider belt of low and level land than is generally found further to the s., between the Andes and the sea.—4. The city, the capital of the department, stands on the right bank of the river, at the distance of 40 m. from its mouth. It is divided into two parts, the old and the new. The houses are mostly of wood; the principal are the cathedral, the two hospitals, and the two colleges, the last of which have faculties of theology, philosophy, and law. Guayaquil possesses the best, perhaps the only really good harbor on the Pacific shores of South America, the naturally deep channel being aided by a tide which sometimes rises and falls 24 feet. Occupying such a position, and being in lat. 2° 11′ s., the place is necessarily unhealthy. Still it has a population of 25,000, and carries on an extensive trade. In 1873 (besides the steam-packets), 128 vessels, of 113,034 tons, entered, and 118, of 110,662 tons, cleared the port. In 1870 the imports amounted to £760,500, the exports to £783,000. In 1869 the imports were £405,200; the exports, £504,500. In 1876 the exports were £673,925. The chief articles of import are cottons (more than a quarter of the whole), woolens, wines, spirits, grocery, soap, etc., metals, flour, and linens; and of export, cocoa, straw-hats, timber, bark, hides, orchilla, tobacco, sarsparilla, canes, india-rubber, and coffee.

GUAYAS, a province of Ecuador on the Pacific ocean at the border of Peru; 11,502 sq.m.; pop. '75, 87,427. The soil is fertile with profuse natural vegetation. The climate is excessively hot.

GUAYMAS, a seaport in the state of Sonora, Mexico, on the gulf of California. The harbor is one of the best on the Mexican coast, but the town is otherwise unimportant, having a population of only a few hundreds. There is considerable foreign trade and exports of wheat, hides, etc.

GUB'BIO (ancient *Iguvium* or *Eugubium*), an interesting city in central Italy, is beautifully situated on the south-western declivity of the Apennines, in the province of Urbino, and about 27 m. s. of the city of that name. Pop. 5,350. It contains several fine public edifices of importance. On the most elevated point of the city, where the ancient fortress stood, is the ducal palace, so called from having been erected and inhabited by the dukes of Urbino, who also governed Gubbio. The municipal palace is a noble old pile of building, erected in 1332 by Matteo di Giannello, a native architect. In the palaces of Brancaleone and Beni are valuable pictures, collections of Etruscan and other antiquities. Gubbio possesses several fine churches, and some excellent public establishments for sanitary and educational purposes. The most important ancient remains are the ruins of a theater, supposed to have been destroyed by the Longobards, a temple of Mars, and an Etruscan sepulcher of great antiquity. At a short distance from Gubbio are the ruins of the famous temple of Jupiter Appenninus; and here, in 1444, were discovered the famous Eugubine tables (q.v.).

GU'BEN, a manufacturing t. and river-port of Prussia, in the province of Brandenburg, is charmingly situated on the Neisse—the banks of which are here planted with vines—at its confluence with the Lubst, 28 m. s.s.e. of Frankfort. Except its gymnasium, it has no notable buildings. The principal manufactures are woolen goods and tobacco. The shipping-trade of the Neisse is of some importance; ship-building is also carried on. On the neighboring heights, fruit-trees and vines are cultivated. The red wine produced here is esteemed one of the finest grown in the eastern portion of the kingdom. Pop. '75, 23,738.

GUDGEON, *Gobio*, a genus of fishes of the family *cyprinidæ*, having a short dorsal fin, a short anal fin, and no strong serrated ray in either, the body covered with rather large scales, and barbules at the angles of the mouth. The COMMON GUDGEON (*G. fluviatilis*) is abundant in many of the rivers of England, particularly in such as have gravelly bottoms, and occasional pools and rapids. It seldom exceeds 8 in. in length; the depth is not one-fifth of the length. The tail is forked. The eye is placed high up on the side of the head. The upper parts are olive brown, spotted with black; the under parts white. Gudgeons swim in shoals. They feed on worms, mollusks, and other small animals, and are extremely ready to bite at a bait, which is commonly a small piece of

a red worm. Great numbers are often taken even by young anglers, and the readiness with which the gudgeon is lured has become proverbial. The gudgeon is much esteemed for the table. Many are taken with casting-nets in shallow water, and kept in well-boats till wanted. Fishmongers also keep them in tanks, constantly supplied with fresh cold water. They thrive well in ponds supplied with fresh water by brooks.

The gudgeon is usually one of the first objects of the juvenile angler's ambition; and with a crooked pin and thread, with a fragment of a worm for bait, the angler often imbibes his first love of the art while catching his first gudgeon. The gudgeon is very easily captured. Swimming in large shoals at the bottom, it watches with incessant industry for every trifling matter brought down by the stream. A small red worm is by far the best bait for the gudgeon; next to it, perhaps, a maggot or gentle. A small hook and a light float are required. A fragment of worm is fixed on the hook, neatness in baiting not being a desideratum, for the same bait, without much alteration, will often take ten or a dozen gudgeons in succession. The bait should drag or trip along the bottom; and if there be gudgeons about, it will hardly fail to attract them. Ground-bait is not required for gudgeon; but if the angler will, with a large rake or any other heavy matter disturb the gravel, and rake a clear bright spot, a yard in width, and two or three in length, the gudgeons, attracted by the dislodged particles, will swarm up to the spot in great numbers in search of food; and thus it is no uncommon thing to take by one or two rakings, from five or six to ten or twelve dozen of gudgeons in one spot. There is no art required in the angling as they bite very boldly, and the angler can hardly miss catching them.

GUDIN, JEAN-ANTOINE-THÉODORE, French landscape and marine painter, was b. at Paris, Aug. 15, 1802, and studied for some time under Girodet-Trioson, but soon abandoned the style of this artist, and ranked himself with the romanticists, on the side of Géricault and Delacroix. He first attracted notice by his picture, "Brick en Détresse," exhibited in 1822. Most of his marine pictures appeared at the Paris exhibition of 1855. Between 1838 and 1848 Gudin painted more than eighty of such pieces for the museum of Versailles. Since 1855 he has exhibited many new paintings.

GUE'BERS, GHEBERS, GABERS, GHAVERS (Turk. *Ghiaur* or *Ghaur*), the followers of the ancient Persian religion as reformed and consolidated by Zerdusht (Zoroaster). This name, Guebers, which is commonly, but against all linguistic laws, derived from the Arabic *Kafir* (a word applied to all non-Mohammedans, and supposed to have been first bestowed upon this sect by their Arabic conquerors in the 7th c.), is evidently nothing but an ancient proper name taken from some pre-eminent tribe or locality, since the Talmud (Jebam. 63 b., Gitt 17 a. etc.) already knows them only by this name (Cheber); and Origen (*Contra Cels.* vi. 291) speaks of Kabirs or Persians, asserting that Christianity has adopted nothing from them. They are also called *atesh perest,* or fire worshipers; *Parsees,* or people of Pars or Fars—i.e., Persia; *madjoos,* from their priests the magi; and by themselves *Beh-Din.* "Those of the excellent belief;" or *Mazdaasman,* worshipers of Ormuzd. For the origin, nature, and early history of this religion, see ZOROASTER, ZEND-AVESTA, SUN-WORSHIP. When the Persian empire became subject to the Mohammedan rule, the great mass of the inhabitants were converted to the religion of Islam. A very small number still clinging to the ancient religion, fled into the wilderness of Khorassan, or the island of Hormuz; but even this remnant was for many centuries the victim of constant oppression. Mahmoud the Ghiznevide, Shah Abbas, and others, are conspicuous by their untiring persecution of them; and the manner in which they were held up to general detestation is best shown by the position assigned them in most popular Mohammedan tales as sorcerers and criminals. At this present moment, there are, according to the very latest native information, about 8,000 Guebers scattered over the vast dominions of their ancestors, chiefly in Yezd and twenty-four surrounding villages. There are a few at Teheran, a few at Ispahan, at Shiraz, and some at Baku, near the great naphtha mountain, but all plunged in the depths of ignorance, and with very few exceptions, of poverty. They have a high reputation for honor, probity, obedience to the law, chastity, and endurance. Another portion, after various migrations—which are told at length in the *kissah-i-Sanjan,* written by Behram (1599 A.D.)—reached India, where they are now settled under the name of Parsees, chiefly in Bombay, where they are very numerous, forming a population of above 50,000, or about 8 per cent of the whole population. See PARSEES.

GUEBWILLER (Ger. *Gebweiler*), a t. in the province of Alsace-Lorraine 15 m. s.s.w. of Colmar, on the right bank of the Lauch, at the foot of the Ballon de Guebwiller. The town is well built, has two handsome churches, one built in the 11th c., and the other in the middle of last century. There are manufactures of tapes, ribbons, cottons, woolen cloths, gloves, nails, and refined sugar; there is also an extensive manufacture of spinning machinery. In the vicinity are coal-mines and slate-quarries; good white wine is abundantly produced in the district. Pop. '75, 11,692.

GUELDER ROSE, or GUELDRES ROSE, a cultivated variety of the water-elder (*viburnum opulus*—see VIBURNUM), in which the flowers are all barren, and instead of forming flat cymes, as in the wild plant, form much larger globose corymbs. It is sometimes called the SNOW-BALL TREE. When abounding in flowers, it is a very ornamental shrub, and is therefore very often planted.

GUE'LDERLAND. See GELDERLAND.

GUELPH, the capital of Wellington, a province of Ontario, 48 m. by rail w. of Toronto on the Grand Trunk railroad; pop. 6,878. There is abundant water power from the river Speed, and a large number of manufactories.

GUE'LPHIC ORDER, an order of knighthood for Hanover, instituted by George IV., when prince regent, on Aug. 12, 1815. It is both a military and civil order, unlimited in number, and consisted originally of three classes—knights grand cross, commanders, and knights—to which the revised statutes of 1841 have added another class of simple members. The grand mastership is vested in the crown of Hanover. The badge of the order is a gold cross, surmounted by the Hanoverian crown—between each division of the cross is a lion passant gardant. In the center is the horse courant of Hanover, surrounded by a blue circle, and the motto, *nec aspera terrent.*

GUELPHS AND GHIBELLINES, the names of two great parties, the conflict of which may almost be said to make up the history of Italy and Germany from the 11th till the 14th century. The origin of these names was formerly the subject of much speculation; but antiquarians are now agreed in tracing them respectively to the two families, Waiblinger and Welf, which in the 12th c., were at the head of two rival parties in the German empire, and whose feuds came to be identified historically with the respective principles for which these parties contended. The actual origin of the assumption of the names is commonly fixed at the great battle of Weinsberg, in Swabia, 1140 A.D., in which the two rival claimants for the empire, Conrad of Hohenstaufen, duke of Franconia, and Henry the lion, of the house of Welf, duke of Saxony, rallied their followers by the respective war-cries, "Hie Waiblingen!" "Hie Welf!" but it is certain that the names were in use from an earlier date, although, probably, rather as representing the family feud, than the political principles which the two families afterwards severally supported. As the chief theater of the conflict of these parties was Italy, the original names took the Italian form of *Ghibellini* and *Guelfi.* The former may, in general, be described as the supporters of the imperial authority in Italy, the latter, as the opponents of the emperors; and as the opposition to imperial authority in Italy arose from two distinct parties, which, for the most part, made common cause with each other—from the church, which asserted its own spiritual independence, and from the minor principalities and free cities, which maintained their provincial or municipal rights and liberties—the history of the struggle is involved in much confusion, and is variously related, and its merits variously appreciated, according to the point of view from which it is regarded. To the churchman, it is the struggle of the church against the state; to the friend of popular principles, it is the conflict of liberty against absolutism and centralization. The same individual—as, for example, the poet Dante—is found to change sides in the struggle. For the most part, however, the interests of the church in these mediæval contests, although regarded by Protestants as excessive in degree, must be confessed to have fallen in with the claims of political and personal freedom. Five great crises in the strife of the Guelph and Ghibelline parties are commonly noted by historians: under Henry IV., in 1055; under Henry the proud, in 1127; under Henry the lion, in 1140; under Frederick Barbarossa, in 1159; and in the pontificate of the great champion of churchmanship, Innocent III. The cities of northern Italy were divided between the two parties—Florence, Bologna, Milan, and other cities, as a general rule, taking the side of the Guelphs; while Pisa, Verona, and Arezzo, were Ghibelline. The great Italian families, in like manner, took opposite sides; but the policy of each family frequently varied from one generation to another. In general it may be said that the nobles of the more northern provinces of Italy inclined to the Ghibelline side, while those of the central and southern provinces were Guelph. By degrees, however, especially after the downfall of the preponderance of the German emperors in Italy, the contest ceased to be a strife of principles, and degenerated into a mere struggle of rival factions, availing themselves of the prestige of ancient names and traditional or hereditary prejudices. Even in 1272 Gregory X. could with truth reproach the Italians with their sanguinary animosities for the sake of what were but names, the meaning of which few of them could understand or explain; and, in the following century, in 1334, Benedict XII. practically disallows altogether the reality of the grounds of division between the parties, by prescribing, under pain of the censures of the church, the further use of those once-stirring names, which had long been the rallying words of a sanguinary warfare. From the 14th c. we read little more of Guelphs or Ghibellines as actually existing parties; but in the sense already explained, the conflict of principles which they represent is found in every period of political history.

GUEMAL, a species of deer on the e. coast of South America, by some persons called the "cloven-footed horse."

GUÉRANDE, a t. in the department of Loire-Inferieure, France, 47 m. n.w. of Nantes; pop. 6,749. There is an old castle in the place, and there are manufactures of some importance.

GUERA'RA, or GERRARA, a t. of Algeria in the district of the Beni-M'zab, stands on the left bank of a river called the Zigrhir or Zegerin, in lat. 32° 45′ n., long. 5° e., and about 40 m. n.e. of Ghardaia. It is a walled town, has three gates, and is a favorite

commercial rendezvous for all the neighboring tribes, who frequent this place for the purchase or disposal of horses, asses, sheep, ivory, gold-dust, ostrich feathers, cotton, silk, cutlery, etc. The market of Guerara is supplied chiefly from Tunis and Algiers. The population is about 12,000.

GUERCINO, "the squint-eyed," properly GIAN-FRANCESCO BARBIERI, a celebrated master of the Bolognese school of painting, was b. in 1590 at Cento, a pretty town not far from Bologna. Guercino gave early proof of his intuitive love of art by sketching with the roughest materials on the house-door a "Virgin" so full of artistic promise, that his father, in spite of the straitened circumstances of the family, took immediate measures for training the boy's talents, by securing for him the best tuition in drawing which the place afforded. In 1616 he opened an academy at Cento, to which pupils flocked from all quarters. From 1619 to 1623 he visited different cities of Italy, particularly Rome and Venice, to improve himself by the study of the works of other eminent painters. In 1642 he went to live at Bologna, where he died in 1666. Some of the early paintings of Guercino bear perceptible traces of his admiration of Caravaggio's style, both in their powerful effects of deep coloring and strong fidelity to nature, while they much surpass those of the great realist in dignity and refinement of tone. They are deficient, however, in accuracy of design. His works, which are too numerous for notice, are to be found in the galleries of Rome, Bologna, Parma, Modena, Perugia, and Paris. His master-pieces are considered to be the fresco of "Aurora," which decorates the ceiling of one of the casinos of the Roman villa Ludovisi; the famous "Persian Sibyl," and "Saint Petronilla," both in the Capitoline gallery at Rome. At Cento, the artist's house, *Casa di Guercino*, is carefully preserved, with its fine paintings and fresco decorations, and is the chief object of interest to those who visit the place. The church of Cento also contains several fine works of this master, who had an intense love for his birthplace.

GUERET, a t. in the department of Creuse, France, 37 m. n.e. of Limoges; pop. 4,973. It has a college, hospital, lunatic asylum, and a normal school.

GUERICKE, HEINRICH ERNST FERDINAND, b. Prussia, 1803; a theologian, graduated at Halle, and was made professor there in 1829. He was opposed to the union of the Protestant churches in Prussia. He has published a *Manual of Church History*, *General Christian Symbols*, *Christian Archaeology*, *History of the Reformation*, *Review of Lutheran Theology*, and other works.

GUERICKE, OTTO VON, a celebrated physicist, was b. at Magdeburg, in Prussian Saxony, Nov. 20, 1602. His personal history contains nothing of interest. As a natural philosopher, he is chiefly known by his discoveries regarding the nature and effects of air. The experiments of Galileo and Pascal on the weight of air led Guericke to attempt the creation of a vacuum. His first experiment was made by filling a stout barrel with water, and then pumping out the water; but it was found that no sooner was a vacuum produced in the barrel than the air forced its way through. He now took a globe of copper with an opening at the bottom into which a pump was fitted, provided with a stop-cock, and to his astonishment found that the pump extracted the air quite as well as the water; then, on opening the cock, the air was heard rushing in with a whistling noise. This, the first air-pump, was invented about 1650. Guericke's invention soon became famous, and in 1654 he was summoned to the presence of the emperor Ferdinand III. of Germany at Ratisbon, at which time he made the famous experiment commonly known as the Magdeburg hemispheres (q.v.). He d. at Hamburg, May 11, 1686.

GUERIN, GEORGES MAURICE DE, 1810–39; a French poet, associate of Lamennais. His poems were collected in 1860 in *reliquiæ*. The poet was long taken care of by his sister Eugénie, a woman of remarkable genius, of devout life, and most agreeable style as a writer.

GUE'RIN, PIERRE NARCISSE, Baron, one of the most eminent historical painters of the French classic school, was b. at Paris, May 13, 1774, and first attracted notice by his "Corps de Brutus rapporté à Rome" (1796). Some of his pieces are regarded as master-pieces of the French classic school. The few portraits executed by Guerin are admirable. Among others may be mentioned one of Henri de la Roche-Jacquelin storming an entrenchment. In 1829 he was raised to the rank of baron, and died at Rome, July 16, 1833. Purity of design, dignity of style, taste in grouping, and harmony of color will be generally conceded to Guerin, but the coldness which marks the classic school of painters is as visible in him as in others.

GUERITE, a small loopholed turret in the wall of a fortress, from which a sentry may command a view and fire over the ditch.

GUERN'SEY, the second in size of the channel islands (q.v.), is situated in lat. between 49° 24′ and 49° 30′ n., and in long. between 2° 33′ and 2° 41′ w.; is distant 69 m. s.e. from Start point, in the s. of Devonshire—the nearest point of the English coast; and is about 46 m. s.w. from Cherbourg, in France. Its length is 9 m., its greatest breadth about 6, and its circumference 31 miles. In 1871 it had a pop. of 30,593. The coast is of difficult approach, owing to the number of rocks and the rapidity of currents around the island. The northern part of the island is flat, the southern more elevated, but intersected by deep valleys and glens, and with a lofty and abrupt coast.

St. Peter's, on the s.e. coast of the island, is the only town. For particulars about the climate, soil, productions, trade, etc., see JERSEY.

GUERNSEY, a co. in e. Ohio, intersected by the Marietta, Pittsburgh and Cleveland, and the Ohio Central railroads; 530 sq.m.; pop. '70, 23,838. The surface is moderately hilly, and much of it is covered with forests. Soil fertile; productions: cereals, hay, wool, butter, etc. Co. seat, Cambridge.

GUÉROULT, ADOLPHE, 1810–72; b. France; devoted his life to literature, and became a supporter of saint Simonism. He was consul at Mazatlan in 1842, and at Jassy in 1847; and five years afterwards was chosen chief of the *credit foncier*. He was the chief editor of the *L'Opinion Nationale*, a member of the *corps legislatif*, and a strong opponent of ultramontanism.

GUERRAZZI, F. D., a patriotic Italian statesman and brilliant writer, was b. at Leghorn in 1805, and, educated for the legal profession, won a great reputation among his countrymen by his political fictions, which are said to have exercised an immense influence on contemporary Italian events by their exalted strain of patriotic enthusiasm and abhorrence of despotism. Guerrazzi's own words are, "he wrote a book when impotent to fight a battle." On the eve of the definite breach between the people and the grand duke of Tuscany, in 1849, Guerrazzi was induced to accept office in the ministry. On the flight of the grand duke he was proclaimed member of the provisional government, and subsequently dictator. During this crisis of the state he energetically refused his adhesion to "the substitution of republicanism for monarchy;" and preserved the strict autonomy of Tuscany until the return of the grand ducal rule, when he was immediately seized and imprisoned on the ground of having neglected due measures of repression when the revolution first gathered strength during his ministry. His defense, entitled *Apologia della vita Politica di F. D. Guerrazzi*, or "Justification of the Political Career of F. D. Guerrazzi," is a masterpiece. After an imprisonment of three years, he was condemned for life to the galleys, but was subsequently permitted to select Corsica as the refuge of his perpetual banishment. Restored to liberty and action by later events, Guerrazzi sat in the parliament of Turin in 1862 and 1865. He died in Sept., 1873.

His chief works of fiction are *L'Assedio di Firenze* (the siege of Florence), a magnificent historical novel, treating of the downfall of the republic of Florence; *La Battaglia di Benevento*, remarkable for exquisite expression and beautiful poetic imagery; *Beatrice Cenci; Isabella Orsini; L'Asino;* and various other writings, which have run through innumerable editions and translations.

GUERRERO, a state in w. Mexico along the Pacific coast, between the sea and the Cordilleras; 24,550 sq.m.; pop. 320,069. The surface is rough and interspersed with mountain ridges. The valleys are fertile, and the vegetation is varied and profuse. Beans and corn are among the chief productions, the latter growing three crops in a year. Among other productions are cotton, sugar, coffee, and tobacco. Among the articles of export are cochineal, indigo, wool, and hides. The chief town and seaport is Acapulco, on the Pacific. Cotton and woolen goods are manufactured. A portion of the people are engaged in mining and a considerable number in the pearl fisheries.

GUERRERO, VICENTE, 1770–1831; b. Mexico; a mulatto and once a slave. In the Mexican war for independence he was an able and brave leader of the revolutionists. After the overthrow of the last emperor (Iturbide) he supported the republic. He ran against Pedraza for president in 1827, and was defeated, but two years afterwards when Pedraza resigned Guerrero seized the presidency. One of his first acts was to abolish slavery. When the Spanish invasion came in 1830, Guerrero was made dictator. He defeated the Spaniards, but soon afterwards his chief commanders Bastamente and Santa Anna revolted against him. A long contest followed which was ended by the betrayal of Guerrero to his enemies by a foreign ship captain who had invited him to dine on board his vessel. Guerrero was forthwith shot.

GUERRIL'LAS (diminutive of Sp. *guérra*, "war," literally "petty" or "partisan wars," or "partisan warriors"), the name given in Spain to the armed bands, composed of peasants and shepherds, who, on occasion of foreign invasion of civil wars, carry on an irregular warfare on their own account. From 1808 to 1814 they were regularly organized against the French, and being favored by the character of the country, were successful on many occasions, especially at the commencement of the war, under Empecinado, the Pastor Merino, Mina, and other leaders. The country itself suffered from the guerrillas, who revenged political treachery, or even the bare suspicion of it, by fearful devastations. Many of them, particularly Mina's band, joined Wellington, and after having undergone a course of discipline, rendered signal service as regular troops. In all the recent civil wars of Spain, the guerrillas, especially those of the Basque provinces, acted a prominent part on the Carlist side.

GUESCLIN, BERTRAND DU, Count of Longueville, constable of France, the most eminent French gen. of the 14th c., was born of an ancient family in the district of Rennes, sometime between 1314 and 1320. As a boy he was remarkably dull, and could never be taught either to read or write, but exhibited a passion for military exercises. In his 17th year he bore away the prize at a tournament at Rennes, and from

this time was always successful in such encounters. In the contests between Charles de Blois and Jean de Montfort for the dukedom of Brittany, he took part with the former. After king John had been taken prisoner by the Black Prince at the battle of Poictiers, in 1356, Guesclin rendered important services to the dauphin, afterwards Charles V. He took Melun and several other fortified towns, freed the Seine from the English, and on Charles's accession to the throne in 1364, was created governor of Pontorson. In May of the same year he gained the battle of Cocherel, and was rewarded by the title of count of Longueville and marshal of Normandy. On Sept. 29 he was defeated and taken prisoner by the English, under sir John Chandos, at the battle of Auray, but was liberated on payment of a ransom of 100,000 livres, paid by the king, the pope, and several other princes. He now supported Henry, count of Trastamare, against Pedro the cruel, king of Castile, but was defeated and taken prisoner by the Black Prince. Being again ransomed on payment of a large sum, to which even the enemy contributed from feelings of respect, Guesclin renewed the contest, and in 1369, defeated and slew Pedro, and placed the crown of Castile on the head of Henry of Trastamare. As an acknowledgment of his services, Henry created Guesclin count of Burgos, duke of Molina, and constable of Castile. He was, however, soon recalled by Charles V. of France, at that time hard pressed by the English, and raised by that monarch to the dignity of constable of France. In the year 1370 Guesclin opened his campaigns against the English, and in a short time the whole of their possessions were in the hands of the French, with the exception of a few fortified towns. While assisting his friend Sancerre in the siege of Château-neuf de Randon, in Languedoc, Guesclin was taken ill, and died July 3, 1380. Charles V. caused him to be interred with great pomp beside his own burial-vault at St. Denys.—Compare Guyard de Berville, *Histoire de Bertrand du Guesclin* (Paris, 1767).

GUESS, GEORGE, or SEQUOYAH, 1770–1843; a half-breed Indian, the constructor of the alphabet adopted and still used by the Cherokee nation. He first made an alphabet of 85 characters, representing as many sounds, using as far as possible English letters. A part of the New Testament was printed in this alphabet. Guess went with his tribe from their old home in Georgia to the Indian territory. He died in Mexico.

GUEST, IN LAW. See INN AND INNKEEPER, *ante*.

GUEUX, or "The Beggars," the name assumed by the confederated nobles and other malcontents who opposed the tyrannical policy of Philip II. of Spain in the Low Countries. Philip having sent nine inquisitors to that country to put into execution the decrees of the council of Trent, provoked by this act the bitter resentment of the Protestants, as well as of the Catholics and nobility, who saw in it an attempt to curtail their ancient liberties. A party of opposition was thus formed, and, headed by counts Louis of Nassau and Henry de Brederode, declared in an act called the "compromise," which was remitted (April 5, 1566) to the regent Margaret, their fixed determination to ignore utterly the authority of the inquisitors. On the admission of a deputation from them to an audience, the regent seemed somewhat unnerved by their bold front, and inclined to yield to their demands: when one of her council approached her, and whispered that she "need not be afraid of these gatherings of beggars." The remark having been overheard by some of the deputation, the abusive epithet was assumed as the title of their association. As a sign of fraternity, each of the "beggars" wore a medal called the "beggar's denier," made of gold or silver, and stamped on the obverse with the image of Philip II., and the inscription, "in everything faithful to the king;" and on the reverse with a wallet, such as the mendicant monks carried, held in two hands, with the works, "even to carrying of the wallet." The "beggars" maintained a long and vigorous contest against the despotic proceedings of Philip and his advisers, but were ultimately compelled to succumb to superior force. A branch of them, "the Beggars of the Sea," under the bold leadership of the savage count de la Marck, were almost uniformly successful in their enterprises: they several times defeated the Spanish fleet, captured transports with supplies for Alva's army, captured several fortresses, and succored besieged places along the coast.

GUGGENBÜHL, LOUIS, 1816–63; b. Switzerland, and celebrated as a physician, particularly in the treatment of cretinism. He published several pamphlets and articles on the subject. A retreat for cretins was established by him, but given up after his death.

GUGLIELMI, PIETRO, a celebrated musician and composer, was b. at Massa di Carrara in 1727. From his father, who was *Maestro di Cappella* in the ducal chapel of Modena, he acquired the elements of music. His first opera, composed at the age of 28, was performed at Turin, and was greeted with enthusiasm. Previous to setting out on a continental tour he visited the chief cities of Italy, and was everywhere successful. After a residence of some months at Dresden, Vienna, and various other towns, Guglielmi passed over to London, where he remained five years, assiduously engaged in composition. At the age of 50 he returned to Naples with the double prestige of great fame and wealth. In 1793 pope Pius VI. appointed him *Maestro di Cappela* at St. Peter's, and from that time his official duties seem completely to have engrossed him. He died at Rome in 1804. The characteristics of his style are pre-eminently simplicity,

purity, and precision, and these qualities he inexorably demanded from the exponents of his inspiration—"Sing *my* music and not *yours!*" His best known operas are—*La Clemenza di Tito; Artaserse; La Didone; Enea e Lavinia; La Morte di Oloferne; Debora e Sisera;* and the comic operas *La Virtuosa di Mergellina; I due Gemelle; La Serva Innamorata; La Pastorella Nobile; La Bella Pescatrice.*

GUIA'NA, BRITISH (Fr. *Guyane*, Sp. *Guayana*, Port. *Guianna*), a section of the extensive tract forming the north-eastern portion of South America, lying between 8° 40' n. and 3° 30' s., and between the meridians of 50° and 68° west. The greatest length of this tract, from cape North to the confluence of the river Xie with the river Negro, is calculated at 1090 m.; its greatest breadth, between Punta Barima, at the embouchure of the river Orinoco, and the confluence of the river Negro with the river Amazon, at 710 miles. It is at present politically divided in Venezuelan, British, Dutch, French, and Brazilian Guiana. The name Guiana is usually supposed to have been applied by the Dutch to the whole country from the name of a small river Wai-ini, a tributary of the Orinoco, on which stands a small town, called Guayana Vicija.

The limits of the British possessions have never yet been accurately determined. If we adopt the idea of sir Robert Schomburgk, the latest authority upon the subject, and assume the natural indications to be the proper guide to the geographical boundaries, we shall include all the regions drained by the waters falling into the river Essequibo; and taking the river Corentyn as the acknowledged line of demarkation between British and Dutch Guiana, we arrive at an area of 76,000 sq.m., a territory much larger than England and Wales. If, on the other hand, the claims of the Venezuelan and Brazilian governments respectively are to be admitted, the British portion will be reduced to something above 12,000 m., and become the smallest of the European colonies in this region.

The coast-line of the British territory consists of an alluvial flat, composed of a blue clay impregnated with marine salts, and mixed with decayed vegetable matter, which, in its decomposed state, forms a rich and highly productive soil. The inland depth of this fertile coast varies from 10 to 40 m., where it is bounded by a range of sand-hills, varying in height from 30 to 120 feet. In the fifth parallel n. lat. occurs a chain of mountains composed of granite, gneiss, and trappean rocks, with their various modifications, and it has been conjectured that it was the ancient boundary of the Atlantic ocean. A peculiar feature of the interior is the savannas extending between the rivers Demerara and Corentyn, and at the river Berbice closely approaching the sea-shore. There is another series of such savannas further inland, and the geological structure of the region indicates that it was once the bed of an inland lake, which, by some great elemental disturbance, burst its barriers, and forced for its waters a passage to the Atlantic. This supposition may throw light upon the origin of the tradition of the White sea and the city of the gold-besprinkled Manoa, which inflamed the ardor of the chivalric Raleigh, and led him to the pursuit of those discoveries by which his name has been immortalized.

The fluvial system of British Guiana consists mainly of four great and seven smaller streams, the whole of the first named and six of the latter pouring their waters directly into the Atlantic. The four great rivers are the Essequibo (q.v), the Demerara (q.v.), the Berbice (q.v.), and the Corentyn (q.v.). The smaller streams are the Pomeroon, the Moruca, and the Wai-ini, between the Orinoco and the Essequibo; the Mahaica, the Mahaicony, and the Abany, beteen the Demerara and the Berbice; and the Canje, which joins the latter immediately before it falls into the ocean. In addition to the foregoing, there are numerous creeks of considerable size, formed by the surplus waters of the savannas behind the sea-coast.

All these streams are continually bringing down quantities of detritus; the coast outline is consequently undergoing perpetual changes: in one place, the drainage of the estates is blocked up by banks of drift mud; in another, incessant exertion is required to repel the encroachments of the sea.

Climate.—The climate of Guiana is genial and equable, and for a tropical country comparatively healthy. The thermometer ranges from 90° to 75° F., the mean temperature being 81°.226. The barometric pressure—highest, 30.05 in.; lowest, 29.74; mean, 29.916; average rainfall at Georgetown, 100.50 inches.

History.—Whether Christopher Columbus himself ever actually landed on the shores of Guiana seems not to be positively ascertained. It is, however, certain that the Spaniards must have settled in the neighboring countries early in the 16th c., as in 1580, when the Dutch began to establish themselves on the banks of the Pomeroon and other rivers, they were speedily driven out by the Spaniards, nor was it until 1602 that they succeeded in obtaining a footing on the river Essequibo. During the 17th and the early part of the 18th centuries, the Dutch were frequently harassed by incursions of the French and by internal insurrections: three distinct colonies were constituted, until, in 1789, those of Essequibo and Demerara were united. Berbice remained a separate colony until 1831, when the three were constituted into the colony of British Guiana, consisting of the counties of Demerara, Essequibo, and Berbice.

Towards the close of the 18th c., the feelings of the inhabitants had become strongly influenced by a desire to place themselves under British sovereignty, and in 1796 effect

was given to that desire by the cession of the colonies to an expedition under maj.gen. Whyte. At the peace of Amiens, in 1802, however, the colonies were restored to the then "Batavian republic," to be again surrendered to Great Britain in 1803, which was finally confirmed at the peace of 1814.

Government.—The political constitution of the colony has undergone but little modification since its affairs were administered by the Dutch. It retains peculiarities which distinguish it from that of any other colonial dependency; the principal variations introduced have been the division of the colony into electoral districts; a new definition of the qualification for holding the electoral franchise, and open instead of secret voting. The electors return members of two distinct bodies; one is termed the "college of electors," seven in number, who hold office for life, unless they quit the colony; the special function of this body will be explained hereafter. The other elected body is termed the "college of financial representatives," and consists of six members. The legislative body comprises ten members, five of whom, including the governor, who personally presides over its deliberations, are nominated by the crown, and hold office under it, the remaining five are chosen as vacancies occur by the existing members of the court from a double nomination sent up by the college of electors above described. Once in each year, what is called the "combined court" holds a session for the purpose of agreeing upon the annual expenditure, and determining the nature and amount of the taxes to be levied. This court, which is also presided over by the governor in person, consists of the court of policy "combined" with the college of financial representatives, and its legislative functions are confined to passing the annual tax ordinance. Practically, in the legislative body, or court of policy, the governor is able to carry any measure he desires, possessing, as he constitutionally does, a double vote; but it is hardly necessary to add that this power has been very sparingly resorted to, and the same may be said of the power of vetoing any proposition brought forward either in that or the combined court, should he deem it objectionable. The direct responsibility of the governor to the crown for any and all of his acts, has been found in practice an ample safe-guard against any abuse of these large prerogative powers. Another privilege reserved to the governor is that of originating all money votes; and while the majority in the combined court may reduce, they are prohibited from increasing the amount of any item of the public expenditure as annually settled.

The judicial system of the colony continued until a comparatively recent period, to be as it was established by the Dutch; and the Roman code is still the basis of the administration of justice in civil matters. Trial by jury in such cases, at the option of either party, was introduced in 1844; and in criminal cases, trial by jury was established by law in 1846, and the English criminal code was adopted as the law of the colony.

Besides the supreme and inferior courts, presided over by judges, there are police and stipendiary magistrates in each town and district, with the ordinary powers of summary jurisdiction; a jail in each county, and a penal settlement for the more heinous classes of criminals, situated on the banks of the river Massaruni, about 70 m. from Georgetown. The stipendiary police consists of about 300 men, and there is a strong body of rural constables throughout the colony, consisting usually of the most trustworthy men on the estates, and in the villages, without distinction of races.

There are but two towns, properly so called, in the colony—Georgetown (q.v.) and New Amsterdam (q.v.).

The cultivated portion of the colony is confined to the sea-coast, and to a short distance up each of the rivers Berbice and Demerara. The estates were laid out by the Dutch in the shape of a parallelogram as nearly as circumstances would permit, and the staples were sugar, rum, and molasses, cotton, and coffee. In 1747 two schooners sufficed to carry to Europe the crop of 559 half-hogsheads of sugar; in 1752 the culture of cotton and coffee commenced. Immediately after the conquest by the British in 1796, a great impetus was given to agricultural operations; since that period the fluctuations, arising from various causes at different times, have been considerable, of which some idea may be perhaps arrived at by glancing at the gradual decrease of the numbers of estates in cultivation. In 1831 there were altogether 322; thirty years later there were not more than 160. Cotton and coffee have ceased to be exported; the former is not cultivated, the latter to a very trifling extent. All available resources have been concentrated upon the production of sugar and rum; molasses have much diminished in quantity, owing to the improvement in the manufacture of sugar. By the introduction of improved machinery, and an accession of labor by means of immigration, the produce of many estates has been increased from 50 to 100 per. cent. The timber-trade has become of importance, and for this the colony is mainly indebted to the interest excited in its natural resources by the great exhibitions at London in 1851, and Paris in 1855 and 1878, at which much Guiana produce was exhibited.

It has been ascertained that the population of the colony in the year 1874 amounted to 218,909, inclusive of the aborigines and the troops in garrison. As the increase since 1851 is more than accounted for by the net results of immigration during that period, it seems to follow that the Creole population has rather receded than advanced—a circumstance which, especially as it is belived to be borne out by the experience of some of the smaller West India insular colonies where immigration has had little or no influence, is

matter of serious concern. It is, however, to be remembered, that in the interval the colony has been visited by epidemic cholera and small-pox, both extensively fatal, especially to the aged and the young.

The population is of a diversified character; the aboriginal Indians, who, rapidly becoming extinct, are supposed to number from 7,000 to 10,000, within the British territory; the Creole negro; the mixed race; the immigrants from Madeira, from the East Indies, and from China; with a sprinkling of Europeans, chiefly British, French and Dutch. The immigrants of all races introduced from 1871 to 1874 inclusive, were 27,810. On Dec. 31, 1874, there were 34,360 Indian coolies under indenture; and 14,653 working as ordinary laborers on the estates; 14,883, not indentured, being otherwise employed.

For ecclesiastical purposes, the colony is divided into 17 parishes, of which seven belong exclusively to the church of Scotland, and eight exclusively to the church of England, while Georgetown, in Demerara, and New Amsterdam, Berbice, have ministers of each church appointed to them. The ministers of both churches, with those of the Roman Catholic church and the Wesleyan church, are maintained by salaries from the colonial treasury, secured by law for a term of years. There are also independent missionaries scattered throughout the colony, who are supported exclusively by the voluntary contributions of their flocks. In 1874 the charge for religion amounted to £19,563 19s. 6½d. In the same year public education cost £19,525 18s. 1d., and was reported by the inspector to be in an unsatisfactory state.

The position of this important dependency may be described as one of advancing prosperity; but until a more ample supply of available labor induces a greater influx of capital, it cannot be asserted that its condition is positively satisfactory. Like the other sugar-producing colonies of Great Britain, it has had to struggle against great difficulties—partly, at least, arising from imperial legislation; and it has still to contend with an expensive system of recruiting the deficient labor-market from distant regions.

The statistics of the years 1861 and 1874 show the steady progress of the colony. In 1861 the revenue was £301,761; the expenditure, £325,032; in 1874 they were respectively £603,790 2s. 5d., and £613,798 15s. 10d. The public debt has decreased from £576,499 to £347,264 4s. 10d., with ample security. In 1861 the imports were valued at £1,339,713; in 1874, £1,873,219 9s. In these two years the exports were valued at £1,583,649 and £2,761,837. Sugar, rum, and molasses are the chief exports, and in 1874 had a value of £2,579,246. The trade in valuable native woods—chiefly greenheart—is enlarging, being, in 1871, worth £3,900, and in 1874, £32,418. The imports consist mainly of flour, dried salt fish, rice, malt liquor, brandy, machinery, oils, lumber, pork, and manufactured goods. There are 124 sugar estates, 65 plantain (provision) estates, 78 cattle farms, 16 coffee and 9 cocoa-nut estates. In 1874 there were exported 908,887 hogsheads of sugar, 276,606 puncheons of rum, and 179,625 puncheons of molasses. During the same year 7,615 immigrants from the East and West Indies were added to the coolie population. The criminal statistics for 1874 show a large amount of crime. Out of a population of 218,909, there were 39,965 apprehensions and summonses; and of those convicted there were 17 for murder, 22 for manslaughter, and 7 for attempt of murder.

GUIANA, DUTCH, or SURINAM', lies between British and French Guiana, and is separated from the former by the Corentyn, which forms its western boundary, while the Marony separates it from the territories of the latter, and constitutes its eastern boundary. To the n. it is bounded by the Atlantic, and s. by the Acarai mountain-range, which divides it from Brazil. It extends from 2° to 6° n. lat., and from about 53° to about 57° w. long., and has an area of 45,000 sq. miles. Pop. Jan. 1, '75, 51,834, of whom 713 were Europeans, 464 Chinese, and 3,085 East Indian coolies. The births (in 1874) were 1548; the deaths 3,364.

Although the physical character, climate, and productions are very nearly the same as British Guiana (q.v.), the natural advantages of the colony are not so fully developed, and in the hilly districts in the interior and south, which are held by the Maroons, or runaway slaves, the lands are wholly uncultivated. The rivers all fall into the Atlantic, and the most considerable is the Surinam, which has a course of nearly 300 m., but is not navigable for large ships many miles above Paramaribo (q.v.), the capital, which is built about 10 m. from its mouth. Dutch laws are in force, and the coinage, weights, and measures of the mother-country are generally used. The government of the colony is administered by a governor-general (nominated by the king of the Netherlands) and a general council of native freeholders. All religions are tolerated, and the Jews have synagogues in different parts of the colony. The Moravian missionaries serve 194 plantations, and had, in 1875, 23,576 persons enrolled.

The principal exports are sugar, coffee, cacao, rum, molasses, many sorts of valuable wood, gums, balsams, and drugs. In 1874 the goods imported were valued at £303,781, and the exports at £218,067. Cleared inward, 204 vessels measuring 26,472 tons; outward, 212, with a tonnage of 27,593. Among the exports were 24,135,503 lbs. sugar, 2,435,483 lbs. cacao, 127,460 lbs. cotton, 57,549 lbs. quassia-wood, 1029 lbs. coffee, 201,780 gallons of rum, and 273,159 gallons of molasses.

There were in all 290 plantations with about 30,000 acres in cultivation. The chief product is sugar; then, in order, cacao, cotton, coffee. The live-stock were 3,515 head

of cattle, 208 horses, 82 mules, 250 asses, 1134 sheep, 422 goats, and 1733 swine. The revenue (1874) amounted to £101,984, and the expenditure to the same. The letters by mail were 39,114; newspapers and circulars, 39,551. A bill for the emancipation of the slaves was passed Aug. 8, 1862, and came into force July 1, 1863. The compensation given was £25 for each slave.

The Dutch, who were the first European settlers in Guiana, organized trading stations on the coast as early as 1580, from which period till 1790, when Demerara and Essequibo fell into the hands of the English, they retained possession of most of Guiana. The presesent limits of Dutch Guiana were settled by the congress of Vienna.

GUIANA, FRENCH, includes the districts lying between 2° and 6° n. lat., and 51½° and 54½° w. long., and is bounded on the n. by the Atlantic; on the w. by the Marony river, which separates it from Dutch Guiana, and by the little-known districts lying beyond the Rio-Branco; and on the s. and e. by the river Oyapock and the range of the Tamucumaque mountains, which separate it from the empire of Brazil. The area, according to the best French authorities (Block, etc.) is 18,000 square leagues, but the boundary line of French Guiana is not well defined, and has long been a subject of discussion with the Brazilian and Dutch governments. Pop. '72, 24,171. In addition to the continental districts, French Guiana comprises several islands in the immediate vicinity of the coast, the principal of which are Cayenne, in which is situated the capital of the same name, Le Grand Connétable, and Le Petit Connétable. The country is divided into high-lands and low-lands, the former of which commence at the first cataracts of the rivers, and gradually increase in height towards the central districts, which they traverse in a granite mountain-range, which nowhere exceeds an elevation of 1000 feet. The low alluvial lands, which extend from the cataracts to the Atlantic, are at present mostly covered with vast forests, but the soil is well adapted to the cultivation both of grain of every kind, and all the products of tropical vegetation. Among the 20 navigable streams or rivers, the principal are the Marony, lying to the w., and the Oyapock to the e. of Cayenne, the navigation of which is rendered difficult from the numerous cataracts and rapids by which they are obstructed. The overflowing of the rivers gives rise at various points in lower French Guina to swamps or marshy savannas, which are covered with forests of mango-trees and palms, while in other parts lakes are formed, the most extensive of which are those of Mapecucu, Macari, and Mapa.

French Guiana has a rainy season, which lasts with short intermissions from Nov. to June; and the heat is less oppressive than in most places in the West Indies, in consequence of the influence of the trade-winds, which bring with them the temperate moisture of the Atlantic. The thermometer seldom rises above 90° or falls below 75°.

The chief products and exports are choice woods for ornamental purposes, rice, maize, coffee, cacao, sugar, cotton, nutmeg, cloves, and pepper.

French Guiana or Cayenne, which was first occupied by France in 1633, is now divided into 14 communes comprised under the two cantons or districts of Cayenne and Sinnamary, and placed under the command of a governor assisted by a privy council. A recent French budget stood charged with the sum of barely 134,500 francs for ordinary expenses of government in Guiana, and 2,000,000 francs for the penal settlements at Cayenne. The administration of justice is centered in the tribunal or imperial court at Cayenne, the chief town of the province, and is under the jurisdiction of a president, assisted by counsel, auditors, and notaries. There are 9 free elementary schools in the colony, giving instruction to 1100 children, which are under the superintendence and management of the clergy of the Romish church, of which the majority of the population are members, although various forms of faith are tolerated, and supported at the charge of the state.

In accordance with an imperial decree of 1854 Guiana has been made the principal seat of the penal settlements of the mother-country, which are maintained at Cayenne at the national charge. All persons sentenced to eight years' hard labor are condemned, on the expiration of their sentence, to reside for the remainder of their lives in the colony, unless when they are specially pardoned, in which case they are seldom allowed to return to France. Grants of lands, with the restitution of civil rights, may be accorded by the local authorities as a recompense for good conduct; but the discipline is in all cases severe, and the labor heavy and continuous. The mortality among the prisoners is believed to be very great, but the French government does not include the death-rate of Guiana in its otherwise very full tables of mortality.

GUIANA BARK, FRENCH, the bark of *Portlandia hexandra*, also called *Couteria speciosa*, a tree of the natural order *cinchonaceæ*, with opposite ovate leaves, and corymbs of very large purple flowers, a native of Guiana. The bark is esteemed a very powerful febrifuge, and the value of the widely-known medicine, called *Warburg's Fever Drops*, is believed to depend mainly upon it.

GUIB ANTELOPE, or HARNESSED ANTELOPE, abounds in vast herds in w. Africa. Its sides are a dull red with white stripes which at a distance make it look as if wearing a harness.

GUIBERT, JACQUES ANTOINE HIPPOLITE, Count de, 1743–90: a French writer on military tactics. Frederick the great was rather prejudiced against the young writer, but on more intimate knowledge he greatly commended him. Guibert served in high

positions in the French armies, and in 1789 he was member and reporter of the council of administration in the department of war, He retired from public life in 1789. His most important work is his *Essay on Tactics.*

GUICCIARDINI, FRANCESCO, an Italian statesman and historian, was b. of noble parentage at Florence, in 1482. The combined studies of law and literature engrossed his earliest attention, and were cultivated with such signal success, that before he reached the age of 23, he was elected professor of law by the signoria of Florence, and acquired, at the same time, a reputation of great skill as a legal practitioner. His knowledge of international law, and tact in the conduct of public affairs, caused him to be selected in 1512, by the signoria, as ambassador to the court of Ferdinand, king of Aragon. During a period of two years he discharged his diplomatic duties with consummate ability. On his return to Florence he was received with every mark of public approval, and in 1525 was despatched by the republic to receive at Cortona, pope Leo X. This sharp-sighted pontiff at once secured Guicciardini's services, and committed to him the government of Modena and Reggio, and finally of Parma. Clement VII. continued to shower dignities on Guicciardini, and appointed him, with unlimited powers, governor of the Romagna, and finally of Bologna. On the accession of Paul III. Guicciardini resigned all his dignities, and after 18 years of papal service, returned to Florence, where Alexander de' Medici had just been thrust on the citizens as their sovereign by Charles V. On the assassination of Alexander, Guicciardini promoted materially the elevation of Cosmo de' Medici; but meeting with no special favor from that prince, he withdrew from Florence to his villa at Arcetri, where he commenced his famous work, *La Storia d'Italia.* He died in 1540 before its completion. In 1561, 21 years after his death, the first sixteen books of his history were published, and three years later, four additional books appeared. The work is considered a standard of classical historical writing, independent of its value as a minute and faithful record of the period it embraces, from 1490 to 1534. A magnificent Italian edition was published at Freyburg, 1775—1776, four vols. 4to, strictly in accordance with the manuscripts deposited in the Magliabecchi library at Florence, and another at Pisa, 1819, 10 volumes 8vo, edited by Rosini. In 1857-58, there appeared at Florence *Opere inedite di Francesco Guicciardini,* comprising a series of aphorisms and discourses on the Florentine institutions, in the form of dialogue, recovered from the MSS. in the family archives.

GUICCIOLI, TERESA, Countess, 1801–73; the daughter of count Gamba; married when 16 to count Guiccioli who was over 60. She is known to fame from her intimate relations with Byron, the English poet with whom she was associated in 1819–22. Twenty-five years after Byron's death, in her 51st year, she married the marquis de Boissy.

GUICOWAR, or "the Herdsman," the designation of a powerful Mahratta prince, whose dominions at the present time include most of Guzerat (q.v.), with Baroda for capital. The Guicowar originally, as the name denotes, was an officer in the establishment of the rajahs of Satara, the supreme rulers of the Mahrattas (q.v.), and after a time rose high in rank from his military services, being ultimately appointed hereditary second in command of the Mahratta armies, of which the command-in-chief was vested in the family of Sindia. Pelajee, who became Guicowar, in 1721, by predatory excursions gradually acquired authority over Guzerat; and his son Damajee, who succeeded in 1732, still further extended the bounds of this ample dominion. The latter then threw off his allegiance to the Peishwa, but being taken prisoner by treachery, he was compelled to yield one half of his dominions, and do homage for the other half. Annund Rao, who ascended the throne in 1800, was the first prince of the line who had intercourse with the British Indian government; and it is worthy of remark that, down to the present time, the relations of the British with these Mahratta princes have been uninterruptedly friendly. The two powers came into contact on the occasion of a civil war between the reigning prince and an illegitimate brother who aspired to the throne; and in consideration of the aid afforded him by the Bombay government, the Guicowar agreed by treaty to disband his Arab soldiers, and receive a British subsidiary force, Mar. 15, 1802. A treaty of general defensive alliance was concluded April 21, 1805, by which a British subsidiary force is maintained by the Guicowar. In 1816 the Guicowar quarreled with the Peishwa about some districts claimed by each. The Peishwa caused the ambassador of the Guicowar to be assassinated; and his refusal to give up his agent involved him in war with the Calcutta government, which terminated in the annexation of his state. Syajee Rao, who became Guicowar, in 1819, was frequently reprimanded by the British government, and in 1838 part of his state was sequestrated. In 1840 he made his submission, and among other concessions abolished suttee. His successor, Mulhar Rao, inherited the family vices, and in 1873 a commission inquired into his conduct. He was subsequently accused of attempting to poison Colonel Phayre, the British resident, and tried before a commission which disagreed about his guilt; but he was deposed on account of his general misrule, and Gopal Rao, a prince of the Candeish line, was appointed his successor. See BARODA.

GUIDES, in military affairs, are usually persons drawn from the country in which an army is encamped. A sufficient body of intelligent men is collected at head-quarters, to

enable one or more to be sent with every detachment of troops which leaves the camp. A guide should be quick of eye, experienced in the topography of the country, and, above all, faithful. As, however, guides must on most occasions be drawn from the midst of a hostile population, and have probably only a pecuniary interest in serving well, their conduct is always watched with the utmost jealousy, death being awarded as the punishment for the least departure from trustworthiness. Any treason or incompetence on the part of a guide might involve the most disastrous consequences to a whole expedition. In the French army a considerable corps of cavalry and infantry bear the name, but the name only, of "guides." They were first formed in 1744, as a small company of messengers on active service. The number was gradually increased until the time of Napoleon I., who formed them into a guard 10,000 strong.

GUIDO, ALESSANDRO, an Italian poet, was b. at Pavia, in 1650. Literature and poetry engrossed his earliest attention, and to the taste and ability of his first pieces, he owed the notice of the duke of Pavia, whose favor he further secured by the talent he evinced in setting his verses to fine spirited airs of his own composition. In 1685, with the sanction of the duke, he set out to Rome, where his kind patron assigned him apartments in the Farnese palace. He was fortunate enough to obtain the friendship of Christina, queen of Sweden, and composed, at her desire, the pastoral drama of *Endimione*, the princess condescending to be his fellow-laborer in the work. He died at Rome, 1717. The dramas of Guido fail in sweetness and affection, but are interesting and elevated in sentiment. As a lyrical poet Guido ranks very high.

GUIDO ARETINO, so called from his birthplace, Arezzo, was a monk of the Benedictine order, and flourished about the year 1030, but neither the date of his birth nor death is known. He has the reputation of being the inventor of musical notation, and the regenerator of music. The circumstances which led to Guido's invention are differently stated; but the most reliable account seems to be, that on one occasion while chanting with the monastery choir a hymn in honor of St. John, he was struck with the gradual and regularly ascending tones of the opening syllabic sounds of each hemistitch, in the three first verses:

Ut queant laxis	*re*-sonare fibris
Mi-ra gestorum	*fa*-muli tuorum
Sol-ve polluti	*la*-bii reatum, etc.

With the intuitive foresight of genius, he instantly, we are told, comprehended the fitness of these sounds to form a new and perfect system of solfeggio, and forthwith proceeded to mature and systematize this idea. On introducing his new theory into practice among the youthful choristers of the monastery, the experiment proved entirely successful. The fame of Guido's musical invention drew upon him the attention of the pope (John XX.), who invited him to Rome. Guido repaired thither, and obtained a very gratifying reception. The pope himself found pleasure in becoming a student of the new system, under the guidance of its founder and teacher. Ill health, however, compelled Guido to return to the pure and bracing climate of his birthplace, and, re-entering the monastery of Pomposa, he there tranquilly ended his days. Guido has left some interesting writings, explanatory of his musical doctrines, viz., the *Micrologus;* and the *Argumentum Novi Cantus inveniendi.*

GUIDO DE BRES, 1540–1567; b. at Mons. Persecuted for having left the church of Rome, he fled to London, joined the Walloon church, and entered the Protestant ministry. Returning to his native country, he labored earnestly as an evangelist in various parts of France. At the storming of Valenciennes by Noircarmes, Guido, in escaping, was caught, and after an imprisonment of seven years was hanged. The confession of faith which he prepared in 1559, and which was approved by Calvin, he published in 1562 as the *Confession of Faith of the Reformed Church in the Netherlands.*

GUIDON, the standard borne by regiments of light cavalry; it is broad at one end, nearly pointed at the other, and usually of silk.

GUIDO RENI, a celebrated painter of the Bolognese school, was b. at Bologna in 1575, and at first aimed at the somber coarse strength of Caravaggio's creations, but subsequently followed the more refined and ideal school of the Caracci, previous to finally striking out a style for himself. His works are extremely numerous, and the majority reflect a sentiment of fervent spiritualism, more characteristic of the devotion of the early Bolognese school, than of the later spirit infused by the Caracci, the founders of the modern standard of Bolognese art. Guido Reni was unhappily an infatuated gambler, and with the view of replenishing his often-squandered finances, produced with extreme rapidity many inferior works undeserving his name. He died in 1642. Amongst his best productions are, "The Crucifixion of St. Peter," a magnificent work in the Vatican museum; the "Crucifixion" in the church of St. Lorenzo, in Lucina, Rome. The famous portrait long assumed to be that of Beatrice Cenci is probably not from his hand. The "Aurora" of Guido Reni, on the roof of one of the halls of the Rospigliosi palace, is a fresco of world-wide fame, and is considered the greatest of his works.

GUIDO OF SIENNA, a painter of the 13th c., about whose work there is much uncertainty. In the church of St. Domenico in Sienna is a large painting of the virgin and child enthroned, with six angels above, and in the Benedictine convent of the same:

city is a triangular pinnacle, once a portion of the same composition, representing the Savior in benediction, with two angels; the entire work was originally a triptych, but is not so now. The principal section of this picture has a rhymed Latin inscription giving the painter's name as Gu . . . o de Senis, with the date 1221; the genuineness of the inscription is not, however, free from doubt. In the general treatment of the picture there is nothing to distinguish it from other works of the same early period; but the head of the virgin and child are indisputably very superior, in natural character and graceful dignity, to anything to be found anterior to Cimabue. The best informed connoisseurship of recent years concludes that the heads are repainted, and are, as they now stand, due to some artist of the 14th c., perhaps Ugolino da Sienna; thus the claims of Cimabue would remain undisturbed. Beyond this little is known of Guido da Sienna. There is in the academy of Sienna a picture assigned to him, a half-figure of the virgin and child, with two angels, dating probably between 1250 and 1300; also in the church of San Bernardino in the same city a Madonna dated 1262. Milanesi thinks that the work in San Domenico is due to Guido Graziani, of whom no other records remain earlier than 1278 when he was mentioned as the painter of a banner. [From *Encyc. Brit.*]

GUIENNE, the name of one of the 32 provinces into which France, previous to the revolution, was divided. It comprehended the territory now formed by the departments of Gironde, Lot, Dordogne, Aveyron, and portions of Tarn-et-Garonne, and Lot-et-Garonne, and formed with Gascony (q.v.) what was originally the country of Aquitania, of which name Guienne is a corruption. Its earlier history is described under Aquitaine (q.v.).

GUIGNES, JOSEPH DE, b. at Pontoise, Oct. 19, 1721, acquired a great reputation as an orientalist, at a time when the acquisition of eastern languages was a matter of no small difficulty. Chiefly on account of his thorough knowledge of Chinese, he was appointed interpreter for oriental languages in the Bibliothèque du Roi. Guignes died at Paris, Mar. 19, 1800. His great work, *L'Histoire Générale des Huns, Turcs, Mogols, et autres Tartares occidentaux, avant et depuis J. C. jusqu'à present* (Paris, 1756–1758), is a rare specimen of human industry and research, and of which his countrymen are justly proud. De Guignes also contributed a history of Tartary to the new edition of the *Bibliothèque Orientale* of D'Herbelot (1777–1779).—His son CHRÉTIEN-LOUIS-JOSEPH, b. at Paris, Aug. 25, 1759, was also a very distinguished oriental scholar, and published a Chinese dictionary (Paris, 1813), by the orders of Napoleon I. He died at Paris, Mar. 9, 1845.

GUIJAR', or GUIXAR, a lake of Central America, in the n.w. of the state of San Salvador, is 60 m. in circumference, and incloses a large island, which abounds in game, and contains the ruins of what must formerly have been a large town.

GUILANDI'NA, a genus of shrubs of the natural order *leguminosæ*, sub-order *cæsalpiniæ*, having pinnate leaves, and remarkable for the stony hardness of their seeds, the coating of which is so silicious that they are said even to strike fire with flint. The seeds are used for beads and for children's marbles. *G. bonduc* is the best known species, and is of very wide geographic distribution, although, like the rest of the species, growing only in the warm parts of the world. It is called the *bonduc*, and the *nicker tree*, and its seeds, which are often thrown ashore on the coasts of Scotland and Ireland, are called *molucca beans*. The cotyledons are very bitter, and are much used in India for the cure of intermittent fevers.

GUIL'DFORD, a market t., and parliamentary and municipal borough of England, capital of the county of Surrey, is situated in a depression in the North Downs, on the navigable river Wey, 30 m. s.w. of London. Here the Reading and Reigate branch of the South-Eastern railway crosses the direct Portsmouth line. The town consists mainly of one street, running along the steep e. side of the Wey, crossed here by an old bridge of four arches, and is distinguished by a remarkable air of order and cleanliness. Its streets are rich in quaint old gables, overhanging paneled fronts, and long latticed windows. The chief buildings are the castle, a fine ruin, in the early Norman style; archbishop Abbot's hospital, in which reside a master, 12 brothers, and 8 sisters; the church of the Holy Trinity, with several memorable monuments; St. Mary's, an interesting specimen of the transition style, and one of the oldest and most remarkable churches in the county; the grammar school founded by Edward VI.; the town hall; and the corn-market. A county hall and assize court was erected in 1862, and a county hospital in 1863–1866. Guildford is now chiefly famous for its grain-market, the "Surrey wheats" being celebrated. It has paper, powder, and corn mills; breweries, brick-fields, coach-works, and two iron-foundries. Guildford now returns one member to parliament, instead of two, as formerly. Pop. '71, 9,801.

This ancient town is first mentioned by name in the will of Alfred the great, who bequeaths it to Ethelwald his nephew. In the time of the confessor, the town and manor were included among the demesnes of the kings of England. Henry II., John, and Henry III. frequently resided here.

GUILDHALL, an important public building in London, which may be regarded as the town-hall, and is the place of assembly of several courts, as the court of common council, the court of aldermen, the chamberlain's court, etc., and a police-court presided

over by one of the aldermen. The guildhall of London was formerly situated in Aldermansbury. The original building was erected in 1411, but was almost wholly destroyed by the great fire of 1666. In 1789 the guildhall was rebuilt in its present form. The hall proper is 153 ft. in length, 48 in breadth, and 55 in height. It has been famous for centuries for the magnificence of its civic feasts. The first time it was used for this purpose was in 1500 A.D., when sir John Shaw, goldsmith, who had been knighted on the field of Bosworth, gave here the first lord-mayor's feast. These feasts had formerly been held at Ewees's hall.

GUILDS (Sax. *gildan*, to pay). Guilds were originally associations of the inhabitants of particular towns, for promoting the common interest of the fraternity. They are said to be of Saxon origin, but unquestionably similar institutions existed at a very early period among the southern nations of Europe, where they were known by the name of confraternities. In England guilds were in use during the Saxon rule, and several records are preserved of the purposes of these institutions. The Saxon guilds appear to have resembled our modern friendly societies. On condition of a certain payment, the members were entitled to relief in case of sickness, and to protection from violence. At a later period guilds were of two kinds, religious and secular. Both classes retained, as a general rule, the principle of mutual relief to the members in sickness; but the former were established for the performance of works of charity, and for the regular observance of certain religious services; while the main object of the latter was the advancement of the commercial interests of the fraternity. In order to the establishment of a guild, religious as well as secular, it was necessary that it should receive the sanction of the sovereign; and in the reign of Henry II. several guilds were subjected to heavy fines, as having been established without that authority. In London there were a large number of religious guilds. In the reign of Richard II. a guild to the honor of St. George the martyr, consisting of an alderman, master, brothers, and sisters, was established in Norwich; and here, it may be observed in passing, that the term alderman was a name for a chief officer or governor in a guild, whence it was extended to an officer of a burgh on the extension of guilds, as noticed below. It having been an orderly virtuous society for the space of 30 years from its erection, king Henry V. confirmed it by letters-patent under the great seal, made it perpetual, and granted it certain privileges and immunities (Madox, *Firma Burgi*). In like manner guilds were formed in Bristol, Exeter, and other large towns. These guilds, through the munificence of individuals, by degrees amassed considerable wealth. By Henry VIII. the property and revenues of these religious guilds were seized and perpetually vested in the crown.

The most important branch of this subject is that of the secular guilds, or, as they were styled in the s. of Europe, confraternities. These institutions were the germ of the modern burghs or municipal corporations. They consisted originally of the members of some particular trade, united for the purposes of mutual assistance in sickness, and for maintaining the interests of the trade. Thus we have the guild of goldsmiths, of weavers, of cordwainers, of pattern-makers, of spectacle-makers, etc., the names of which are preserved to the present day. Every trade had its separate guild, of which it was necessary that a man should be a member before he was allowed to practice the particular craft. As trade increased in importance, the influence and power of the guilds increased in proportion, until at length the towns or united guilds claimed from the sovereign special rights and privileges—*quod habeant gildam mercatoriam.* The town of Southampton received a charter confirming their liberties as early as Henry II. Liverpool was made a *gilda mercatoria* by Henry III. In the reign of Henry VI., the title used was *communia perpetua*, or *corporata*, which phrase has continued to be used in the modern corporations. This title of *communia* appears to have been borrowed from the continent, where, under the title of communities, the towns at a very early period obtained charters declaring their independence, and bestowing on them extensive privileges.—See Robertson's *Charles V.*, and Madox, *Firma Burgi.*

The exclusive privileges of English and Scottish guilds or corporations are now abolished, as being contrary to public policy; and these associations exist only for mutual beneficiary purposes. Thus, in various boroughs in England, a custom had long prevailed, and by-laws had been made, to the effect that no person, not being free of the borough or of certain of these guilds, should keep a shop for merchandise, or exercise certain trades within the borough; but since 1835, when the municipal corporation reform act (5 and 6 Will., IV. c. 76. s. 14) passed, every lawful occupation is free, notwithstanding any such custom or by-laws. The exclusive privilege of trading in Scotch burghs was abolished by the statute 9 and 10 Vict. 17. For the functions of the dean of guild in Scotch burghs, see DEAN OF GUILD.

GUILFORD, a co. in n. North Carolina, on Deep river, crossed by the Richmond and Danville, and the North Carolina railroads; 650 sq.m.; pop. '70, 23,584—6,698 colored. The surface is undulating, and in some parts has good timber. Corn, oats, tobacco, and pork are the main products. Co. seat, Greensborough.

GUILFORD, a t. in New Haven co., Conn., on Long Island sound and the Shore Line railroad, 16 m. e. of New Haven; pop. 2,576. It has several churches, the Guilford institute, and some manufactories. Fitz-Greene Halleck, the poet, was born here.

GUILFORD COURT HOUSE, a small village in Guilford co., N. C. A battle was fought here Mar. 15, 1781, between the revolutionists under Greene, and the English under Cornwallis. It was not a decisive action, both parties suffering severely, and both declining to renew the attack.

GUILLEMOT *Uria*, a genus of web-footed birds, of the group *brachypterœ* (q.v.) or divers, and included by Linnæus in the genus *colymbus* (see DIVER), but now more generally ranked among the *alcadæ* (see AUK) than among the *colymbidæ* (q.v.). The bill is moderately long, straight, and pointed, as in *colymbus*, but rather more compressed, and covered with feathers as far as the nostrils; the feet, as in the other *alcadæ*, are three-toed, having no hind-toe, and entirely webbed. The legs are placed very far back, and are very short, the tibia scarcely appearing beneath the abdomen, so that they are ill adapted for walking, and the posture of the bird on land is erect, even when hatching its egg. The tail is very short. The wings are short, and are moved with great frequency in flight, which, however, the guillemots are able to sustain remarkably well, in consequence of the abundant provision made for aëration of the blood by their very large air-cavities. On the same account, they usually float very high in the water, though, when danger approaches, they can sink their bodies under water, till the head, neck, and upper part of the back are alone visible. They excel in diving, and use their wings for progression under water, where they seek their food, which consists chiefly of small fishes and crustaceans. They are seldom seen in the seas of warm latitudes, but are extremely abundant in those of the arctic regions and the colder parts of the temperate zone, particularly in the neighborhood of rocky coasts. The COMMON GUILLEMOT, or FOOLISH GUILLEMOT (*U. troile*) is abundant on many parts of the British coasts, breeding even on those of the south of England, although large flocks also arrive in winter from the north. It abounds in all the arctic regions. Its winter migrations extend as far s. as the Mediterranean, and in America to New York. It is called foolish guillemot, from its often suffering itself to be taken by the hand rather than leave the cliffs on which it breeds, and where prodigious numbers may be seen stationed close together on the ledges of rock. The parent birds are said to carry their young on their backs from the high ledges to the water. The entire length of the common guillemot is about 18 inches. The common guillemot lays only one egg, which has a very thick shell, is pear-shaped, and remarkably large, being more than three inches long. If the egg is destroyed or taken away, another is laid in its stead. The egg is esteemed a delicacy, but the flesh of the bird is coarse. The skin with the feathers is used for clothing in some northern regions. Young birds and eggs are among the objects in pursuit of which the rock-fowlers of the northern coasts scale or descend the most tremendous precipices. Great numbers of the eggs are exported from the coasts of Newfoundland and Labrador.—The BLACK GUILLEMOT (*U. grylle*) is a smaller species, about 14 inches long; the plumage entirely black in summer, except a large white patch on each wing; but in winter, the under parts are white; the young are mottled or spotted. It is not common on the southern coasts of Britain, but breeds on many of the Scottish islands. It is plentiful in the arctic regions, and is as common in America as in the old world. It has been called the Greenland dove. It lays three eggs, often on the bare rock; but if the situation is damp, it piles up for them a curious nest of pebbles. Other species are enumerated among British birds, but are rare. Several species are peculiar to the northern parts of the Pacific ocean.

GUILLIM, JOHN, 1556–1621; an English writer on heraldry, educated at Oxford, a member of the college of arms in London. He published the *Display of Heraldry*, a work that passed through many editions.

GUILLOCHE, an architectural ornament of Greek origin. It consists of two or more bands or ribbons, crossing and recrossing one another in a regularly repeating pattern. Some of these are simple and some very complicated.

GUIL'LOTINE, the instrument of decapitation introduced during the French revolution by the convention, and named after its supposed inventor, Josephe Ignace Guillotin, a physician (b. 1728—d. May 26, 1814), who, however, it is ascertained, was only the person who first proposed its adoption. It is composed of two upright posts, grooved on the inside, and connected at the top by a cross beam. In these grooves, a sharp iron blade, placed obliquely, descends by its own weight on the neck of the victim, who is bound to a board laid below. The speed and certainty with which this machine separates the head from the trunk, gives it a great superiority over the axe or sword. The invention of machines of this kind is ascribed to the Persians. In Italy, from the 13th c., it was the privilege of the nobles to be put to death by a machine of this kind, which was called *mannaia*. Conradin of Swabia was executed by such a machine at Naples, in 1268. An instrument resembling the guillotine was likewise employed in Germany during the middle ages. During the 16th, and till late in the 17th c., a machine called the *maiden*, which differed but slightly from the guillotine, was employed in Scotland for the purpose of decapitation. That such an apparatus was known and used in France at an earlier period, is proved by the execution of the Duc de Montmorency, who is described as having been executed by a falling axe at Toulouse, in 1632. The Dutch, too, in the 18th c., employed a decapitating machine in executing slaves in their colonies.

GUILTY is the form of verdict given by a jury in criminal cases when the crime charged has been found proved. In England, there are only two verdicts which can be given in such cases—viz., guilty or not guilty; but in Scotland there is an intermediate verdict, called "not proven," which, though in reality a verdict of "not guilty" (and it is so entered in England), yet is allowed to be given by juries when they are not satisfied that sufficient legal evidence has been given, but nevertheless consider there was some foundation for the charge, or at least some ground for suspicion. It has been objected to this verdict that it leaves a stigma on the party: nevertheless, it is firmly adopted in the law and practice of Scotland.

GUIMARÃES, one of the most ancient, picturesque, memorable, and beautifully situated towns of Portugal, in the province of Entre Douro e Minho, stands within an amphitheater of hills covered with the most luxuriant foliage, between the D'Ave and the Arezilla, 12 m. s.e. of Braga. Its narrow streets, its broad red balconies and verandas, its walls, part of which are now in the center of the town, and are surmounted by pointed parapets, and its remains of ancient architecture seen here and there, render the appearance of the town exceedingly striking. Guimarães was the cradle of the Portuguese monarchy, the residence of count Henriques, and the birthplace, in 1109, of Alfonso Henriques, his son, and the first king of Portugal. Among the most interesting buildings are the cathedral, founded in 1385; the castle, a flamboyant structure, surrounded by square towers; and the Dominican convent, with beautiful cloisters of the 14th century. From every elevation in or near the town, magnificent views are obtained. In the vicinity are the Caldas (hot springs) das Taipas, and the Caldas de San Miguel, both finely situated, and well appointed. These springs, which were well known to the Romans, are used chiefly for bathing purposes. They range in temperature from 91° to 120°, are sulphureous, and are said to be very effective in cases of gout and cutaneous disease. Guimaraes is celebrated for its currieries and its paper manufacture; it also exports great quantities of dried plums and figs to England. Pop. 6,000.

GUINAND, FRANÇOIS, 1745–1825; an optician, native of Switzerland. He was the son of a carpenter, and when young made a telescope after one belonging to his employer, so exact a copy that it was not easy to distinguish one from the other. He then made lenses which attracted the notice of Truenhofer, who at once gave him employment. Later in life he constructed many excellent telescopes.

GUIN'EA, the name of a maritime section of western Africa. It extends from the neighborhood of the Senegal to the vicinity of Cape Negro, the stream being in lat. 16° n. and long. 16° 33′ w., and the headland in lat. 15° 41′ s. and about long. 11° 40′ e.; and by the equator, which thus intersects it, it is divided into Upper or northern, and Lower or southern Guinea. This vast region forms the coasts of the Mandingoes, Ashanti, Dahomey, Benin, Biafra, Loango, Congo, Angola, and Benguela, connecting with the Atlantic even more distant territories by means of its rivers, more especially by the Senegal, the Gambia, the Niger, the Old Calabar, the Zaire or Congo, and the Coanza. Guinea was first visited in 1364 by some French merchant adventurers of Rouen and Dieppe, and first colonized by the Portuguese in 1481, who have retained nominal possession of the whole of Lower Guinea, the chief states of which are Loango (q.v.), Congo (q.v.), Angola (q.v.), and Benguela (q.v.). The Dutch, French, English, Danes, and even the Germans, also established various settlements, or rather factories, particularly in Upper Guinea, the coast of which is now divided into Grain Coast, Ivory Coast, Gold Coast, and Slave Coast. Besides the articles thus designated, the soil yields indigo, pepper, cotton, sugar, and palm-oil. The factories were chiefly established to secure the slave-trade, and after its suppression their commercial importance ceased. Great Britain has ultimately endeavored to make a humane and Christian use of its acquisitions. While keeping a naval squadron off the west African shores to intercept the slavers, it was needful to provide for the liberated cargoes of black men and women. The Sierra Leone (see FREE TOWN and SIERRA LEONE) and Gambia settlements were created for this purpose, and here the Wesleyans have many chapels and schools for the natives. For the American settlement, see LIBERIA and MONROVIA. In 1872 the Dutch gave up to England all their possessions on the Gold coast. In return for this cession, England consented to annul the treaties prohibiting Dutch conquests in Sumatra on the straits of Malacca. But the king of Ashanti (q.v.) immediately laid claim to Elmina, the capital of the former Dutch possessions, and after a series of intrigues and diplomatic complications, invaded (April, 1873) the territory now under the English protectorate. He was at first successful; but the arrival of sir Garnet Wolseley (Oct., 1873), followed by some British regiments, soon changed the aspect of affairs, and the Ashanti king was forced to retire into his own country, and after numerous defeats, had to suffer the humiliation of seeing his capital, Coomassie (q.v.), reduced to ashes, Feb. 6, 1874. By the treaty which followed his submission, the king of Ashanti renounced all claim either of tribute or homage from any of the tribes within the limits of the Gold coast.

GUINEA, GULF OF, a portion of the Atlantic ocean, washes that remarkable bend of western Africa which, reckoning from the n., runs first nearly on a parallel, and then nearly in a meridian. It may be regarded as stretching from Cape Palmas, in lat 4° 22′

n., and long. 7° 44′ w., to cape Lopez, about lat. 1° s., and long. 8° 35′ e. At its n.e. extremity is the delta of the Niger, between the Bight of Benin on the n.w., and the Bight of Biafra on the s.e. Off its e. shore, reckoning, from the n., are the islands of Fernando Po, Prince, and St. Thomas.

GUINEA, a gold coin formerly current in Britain, derived its name from the fact that the gold from which the first specimens were coined was brought from the Guinea coast in w. Africa, and, for the same reason, it originally bore the impression of an elephant. It was first coined during the reign of Charles II., in 1664, and continued in common use till 1817, when it was superseded by the *sovereign* (q. v.). Its value varied considerably at different periods, but was latterly fixed at twenty-one shillings. It is still customary in Great Britain to estimate professional fees, honoraria of all kinds, complimentary subscriptions, prices of pictures, etc., in guineas; to give a physician three sovereigns and three shillings, rather than three sovereigns alone, or even three sovereigns and five shillings, is supposed to make the transaction differ from a mere mercantile one, and thus veils the sordidness which is fancied to attach to pounds, shillings, and pence.

GUINEA CORN, a name sometimes given to Durra (q. v.); sometimes to another cereal grass, *penicillaria spicata* or *pennisetum typhoideum,* very extensively cultivated in central Africa, and to some extent also in India, where it is called *bajree.* It is of the tribe *paniceæ,* and may be regarded as one of the millets. It is a grass with a spike-like cylindrical panicle.

GUINEA FOWL, or PINTADO, *Numida,* a genus of gallinaceous birds of the family *phasianidæ,* having a short, strong bill, the upper mandible vaulted, a warty membrane at the base of the bill, and a wattle hanging down on each side, the head and upper part of the neck generally naked, the forehead surmounted either with a callous or a feathery crest; the back much elevated and arched, the tail short. The species are all natives of Africa and Madagascar. The best known is the common GUINEA FOWL, or PINTADO (*N. meleagris*), with naked head, hard callous casque, and slate-colored plumage, everywhere speckled with round white spots of various sizes. It is common in Guinea, and apparently through all the regions thence to the neighborhood of the cape of Good Hope; it is found also in more northern parts of Africa, and was known to the ancient Romans, by whom it was called *meleagris* and *gallina numidica.* Its flesh was highly prized by them. In a wild state, the Guinea fowl is generally seen in large flocks. It is not so polygamous as many of the gallinaceous birds, and even in a state of domestication, exhibits the inclination to pair. It is now common in the poultry-yards of most parts of Europe, although it is more adapted to warm than to cold climates, and in Jamaica has been completely naturalized, so as to be destructive to crops, and to be shot like other game. In Britain the young are rather troublesome to rear, but the high price borne in the market both by the birds and their eggs, compensates those who keep Guinea fowls for profit. The eggs are small, and have a thick strong shell, but are particularly esteemed. Guinea fowls, however, are troublesome in a poultry-yard, from the disposition of the males to attack and tyrannize over other poultry. The Guinea fowl has a peculiar harsh and querulous cry, which it emits with great frequency. There is a white variety of Guinea fowl.

GUINEA GRASS, *Panicum maximum,* a grass of the same genus with MILLET (q. v.), a native of the west of Africa, but now naturalized, and extensively cultivated in the West Indies and southern states of America. It does not perish even in the winters of Britain, but is not luxuriant and productive, as in warmer climates. Its height in favorable moist situations, is from 5 to 10 ft.; in dry grounds, it is smaller; it has a much-branched and spreading panicle, long flat leaves, and a somewhat creeping root. In countries favorable to its growth, it is very valuable as food for cattle.—Other species of the same genus are among the most useful pasture and forage grasses of tropical countries.

GUINEA PEPPER, a name which has been variously applied to the seeds or dried fruit of several very different plants, agreeing in their peppery character, and in being the produce of the west of Africa. The name MALAGUETTA (malagheta, meleguetta, etc.) PEPPER is generally to be regarded as equivalent with Guinea pepper, and is at present a frequent designation of *grains of Paradise* (q. v.); but the capsules or dry berries of *capsicum frutescens* (see CAPSICUM) are commonly sold by druggists under the name Guinea pepper; whilst both the names Guinea pepper and malaguetta pepper have been applied to the dried fruit of *cubeba clusii* (see CUBEBS), and to the seeds of *habzelia* (or *xylopia*) *Æthiopica,* a shrub of the natural order *anonaceæ.* This last was at one time a considerable article of export from Guinea, and was sometimes called ETHIOPIAN PEPPER. It is now seldom even heard of. It is an aromatic and not extremely pungent condiment.—There is great difficulty in determining which of these kinds is meant in many instances in which the term Guinea pepper or malaguetta pepper is employed by the older writers; yet, from the importance of the trade in this article, the name *Grain Coast* was given to a great tract of land in the Bight of Benin, and to it the establishment of the settlements of Grand Bassa and cape Palmas is due. Up to the close of the 18th c. Guinea pepper continued in request, when the peppers of the east drove it from the market.

GUINEA-PIG. See CAVY.

GUINEA-WORM, known also as *filaria medinensis*, or *F. dracunculus*, is a parasitic animal that seems to have been known from the earliest times. Plutarch, in his *Symposiacon* (Table-talk), quotes a passage from the geographer and philosopher Agatharchides of Cnidus, who lived in the second century before our era, which seems clearly to refer to this worm; and it has been argued with great plausibility, that the "fiery serpents" which attacked the Israelites in the desert were in reality Guinea or Medina worms. This view of the "fiery serpents" was propounded by Bartholin in his commentary, and Küchenmeister, one of our highest authorities on parasitic animals, adduces the following arguments in its support. The Hebrew words which in our version are translated "fiery serpents" are *nechaschim seraphim*, the former word is correctly translated "serpents;" while *seraphim*, derived from the word *saraph*, can signify nothing more than *is qui comburit;* and it is clear that a species of animal is referred to which is distinguished by the inflammability of its bite, or generally by the inflammation which its presence causes. "That in ancient times the Filaria [or Guinea-worm] was reckoned amongst the serpents on account of its snake-like form, is proved at once by the Greek name *drakontion* (Lat. *dracunculus*), a species of snake which had something fabulous and inexplicable about it. The inflammatory pain and swelling which occurred with the breaking out of the worm are certainly very well expressed by *seraphim;* while the mortality amongst the Israelites is easily explained by their ignorance of the treatment, and the dangerous symptoms occurring in consequence of the breaking of the worm, which, according to some authors, may be immediately fatal. Only in the last portion of the way through the desert of Zin towards Mount Hor, but especially on the way from Hor towards Oboth, for which journey they required several months, did the Israelites come into the true district of the Medina-worm—namely, the central and eastern portion of Arabia Petræa. This entire march they would undoubtedly have passed over within the period of incubation of this worm (two months to one year). Here the *Filaræ* (or Guinea-worms) first broke up, with violent inflammatory pains. Thus, then, the Israelites contracted these worms, which are still indigenous in Arabia Petræa; and this worm-province may consequently be of importance and interest to geographers in the determination of the course of travels in the fortieth year of the Israelites wanderings." (*On Parasites*, vol. i. pp. 392–393.)

Our knowledge of the natural history of this worm is still very deficient, and we are at present only acquainted with the female. The body of this animal is slender, cylindrical, and somewhat compressed, and is of the thickness of pack-thread, except at the posterior extremity, where it is somewhat attenuated. It is opaque, of a milk-white color; on each side there is a longitudinal line; and when examined by the microscope, it is seen to be marked with numerous tranverse striæ. The anterior extremity is obtuse, and the mouth circular, and beset with four acute spines (but the number, nature, arrangement, and even existence of these spines are points on which helminthologists differ). The length of the worm varies from less than half a foot to three yards. On examining an adult specimen, extracted by Malgaigne in Paris in 1854, Robin found no trace of intestine, or of any organ except a very thin sheath (a uterus or oviduct), which was filled with young animals rolled up in coils, with the tail occasionally projecting outwards. In these young animals, we can trace the course of the intestinal canal, which apparently becomes subsequently obliterated by the excessive development of the generative organs and the eggs.

This worm is indigenous only in certain hot countries, and its geographical distribution is regulated by laws into which we have no insight. Küchenmeister mentions the following places as especially notorious for its occurrence: Senegal, Gaboon, the banks of the Ganges, Bombay, the peninsula of India, Persia, Arabia Petræa, the s. coast of the Red Sea, the region round the Caspian sea, Upper Egypt, Abyssinia, certain districts of Nubia, and Guinea. It has been introduced into certain parts of America by negro slaves.

The disorder occasioned by these worms frequently becomes an epidemic in years of heavy rain, and especially in marshy districts. It appears also to be connected with the season, being especially prevalent in the East Indies during the rainy season, and in Upper Egypt shortly after the regular inundation of the Nile.

The mode of production of this parasite in the human body is not known with certainty. The probability is, that the young animals, while still very minute, penetrate the skin, although by what mechanism they can effect their lodgment, we do not know. Carter relates a case which strongly supports this view. Fifty children in a school at Bombay went to bathe in a pond, and 21 of them were attacked by the Guinea-worm; some of them having four or five worms. Moreover, it is well known that negroes who are in the habit of entering the water more frequently than the whites, and generally have their feet naked, are far more liable to be attacked than Europeans. The part of the body in which the worm usually manifests itself also accords with this view. M'Gregor states that, in 172 cases, it occurred 124 times in the feet, 33 times in the legs, 11 times in the thighs, twice in the hands, and twice elsewhere.

Having gained an entrance into the body, the Guinea-worm takes a considerable time to be developed. This period varies from two months to a year or even two years. The

presence of the worm often produces no annoyance for a considerable time after it has been detected; at other times, it gives rise to emaciation, and possibly even death from exhaustion. As a general rule, the vesicles caused by the inflammation excited by the presence of the worm open spontaneously in a few days, and two or three inches of the anterior end of the animal come forth. This end is gently pulled, and coiled round a little roll of linen or a small stick, and this is fastened over the wound with sticking-plaster and a compress. The extraction is repeated twice a day by rotating the substance round which the worm is twisted, and the operation is often not completed in less than two, three, or more months. From the most ancient times, the tearing of the worm has been regarded as a very dangerous accident. It undoubtedly gives rise to violent swelling, fever, and sleeplessness; and if we are to trust the statements of some of the older observers, shortening and deformities of the legs, lingering fistula, mortification, and death (sometimes even sudden death) must be reckoned amongst the probable consequences of breaking the worm.

Although the ordinary seat of this worm is the subcutaneous cellular tissue, it has been found in the tongue, in the layers of the mesentary behind the liver, and under the conjunctiva of the eye. Small *filariæ* of a different species have occasionally been found in the lens of human eye.

GUINEGATE, BATTLE OF, or more familiarly, the *battle of the spurs*, was fought at Guinegate, not far from Tournai, in the province of Hainault, Belgium, Aug. 16, 1513, between the English, under Henry VIII., assisted by a considerable body of troops headed by the emperor Maximilian, and the French, under the Duc de Longueville. The latter were defeated. The battle received its familiar designation from the circumstance of the French knights, having made better use of their *spurs* than their *swords*.

GUINGAMP, a t. of France, in the department of Côtes-du-Nord, is situated in an extensive plain, on the Trieux, in the midst of pleasing scenery, 20 m. w.n.w. of St. Brieuc. It was formerly the capital of the duchy of Penthièvre, and was surrounded by walls, part of which still remain. The site of the castle of the dukes of Penthièvre is now planted with trees, and serves as a promenade. Guingamp has a college, a thread-factory, and several tanneries. Pop. '76, 7,895.

GUIPU'SCOA, the smallest but the most densely peopled of the Basque Provinces (q.v.).

GUI'SBOROUGH, a market-town of the North Riding of Yorkshire, 5 m. from the mouth of the Tees, and 40 m. n. of York. It is connected with the Stockton and Darlington branch of the North-eastern railway. The town lies at the foot of the Cleveland hills, consists chiefly of one main street of good houses, has several churches, grammar and other schools, almshouses, and market-house. The earliest alum-works in England were established here about the year 1600. There is a trade in wool. Rope-making, brick and tile making, and tanning are carried on. The recent development of the iron-stone mining in the neighborhood has brought a large number of miners and others to reside in and about the town, so that since 1861, the population has greatly increased. A rich monastery once stood here, of which a small part still remains, built in 1119 by Robert de Brus, lord of the town. At the time of the reformation, this was one of the wealthiest and most magnificent monastic institutions in the kingdom. Recent excavations have brought to light many interesting antiquities. Among other objects, the workmen came upon the remains of an oak coffin, containing a skeleton, which was found to measure 6 ft. 8 in. in length. Pop. '71, 5,202.

GUISCARD, ROBERT, Duke of Apulia and Calabria, the sixth in order of seniority of the twelve sons of Tancred de Hauteville, was born in the year 1015. Tancred's estates in Lower Normandy being insufficient to support such a numerous family, his three eldest sons, William, Dagobert, and Humphrey, determined to seek their fortunes in the wars of Italy. By good-fortune, courage, and wiles, William gained possession of Apulia; and Robert, desirous of sharing his brothers' fortunes, followed them to Italy with a small band of adventurers. Here he distinguished himself so highly in various battles, that, after the death of William and Humphrey, he was proclaimed count of Apulia. Guiscard next conquered Calabria, in the possession of which he was confirmed by pope Nicholas II., who, but a short time before, had excommunicated him on account of his many acts of violence. Guiscard, from motives of gratitude, bound himself to pay an annual tribute to the Roman see. The feudal superiority still claimed by the papal see over Naples dates from this period. Guiscard now dispatched his youngest brother Roger, at the head of 300 warriors to conquer Sicily, the possession of which had been promised to him by the pope. Roger, in 1060, took Messina, and in the following year the two brothers defeated the Saracens at Enna. Roger eventually conquered the whole island, and became first count of Sicily. Meanwhile, Robert gradually gained possession of the towns that still remained in the hands of the Saracens, among others, Salerno and Bari, and thus established what was till 1860 the kingdom of Naples. He would have carried his victorious standard in other directions, had he not been excommunicated by Gregory VII., on account of his inroad into Beneventum. Having become involved in the affairs of Greece by the marriage of his daughter Helena with Constantine Ducas, son and heir of Michael VII., he dispatched his son Bohemond to undertake

the conquest of Corfu, while he himself hastened to Durazzo, and before the walls of that city gained a brilliant victory over the Greek emperor, Alexius Comnenus. He now marched through Epirus to Thessalonica, and had nearly reached Constantinople, when he received information that the emperor Henry IV. had made an inroad into Italy. He immediately hastened back, after intrusting the chief command to Bohemond, compelled Henry to retreat, and liberated the pope, who was besieged in the castle of St. Angelo. He then returned to Epirus, defeated the Greeks in several engagements, took possession of some islands in the archipelago, and was on the point of advancing a second time to Constantinople, when he died at Cephalonia, July 17, 1085. His remains were buried at Venusa; his sons Bohemond and Roger inherited his possessions: the former received Tarentum; the latter, Apulia. Guiscard was not only a hero and a conqueror, but a patron of the arts and sciences.—Compare Gaultier d'Arc, *Histoire des Conquêtes des Normands en Italie, en Sicile, et en Grèce* (Paris, 1830).

GUISE, a t. of the department of Aisne, France, situated on the left bank of the Oise, 37 m. n.n.e. from Soissons. It is walled, and otherwise fortified. It is an ancient town, and was of much consequence in the early wars of France. Within the town are the ruins of a castle, from which the famous dukes of Guise (q.v.) derived their title. Guise is now a place of considerable commercial and industrial activity; has linen and cotton manufactures, tanneries, etc., weekly markets, and eight annual fairs. Pop. '76, 6,242.

GUISE, the name of a branch of the ducal family of Lorraine, distinguished in the history of France and Europe during two centuries. It derives its name from the little town of Guise, in the department of Aisne (situated on the Oise). The following are its most remarkable members:

Claude of Lorraine, first duke of Guise, peer of France, grand huntsman, count d'Aumale, marquis of Mayenne and Elbeuf, baron of Joinville, etc., was the fifth son of René II., duke of Lorraine, and was born at the château of Condé, Oct. 20, 1496. He left Lorraine on account of a quarrel with his elder brother, accompanied Francis I. to Italy, and received twenty-two wounds at the battle of Marignan, 1515. Eight years later he drove the Germans from Champagne. In 1542 he fought in Flanders under the duke of Orleans. He was favored by the king for his valor and talent. He married Antoinette of Bourbon, by whom he had twelve children, of whom eight were sons. His daughter Mary was the wife of James V. of Scotland, and mother of Mary, queen of Scots. He is reported to have died of poison, April, 1550.

François of Lorraine, second duke of Guise, son of the preceding, was b. Feb. 17, 1519. As a gen., he acquired European renown. He distinguished himself at Montmedy (1542), Landrecies (1543), St. Dizier (1544), Boulogne (1545), and attracted the attention of France by his defense of Metz, besieged for two months by Charles V., who, after firing 11,000 balls, and losing 30,000 men, was obliged to raise the siege (1553). He added to his reputation at Renti (1554), and in 1556 took command of the expedition against Naples. This expedition failed through treachery; but the duke, having been made lieut.gen. of France, retrieved his reputation by taking Calais, Guines, and Ham, which were in possession of the English, and were considered impregnable. His military successes were ended by the peace of 1559. His niece, Mary Stuart, being the wife of Francis II., he became the highest power in the state, and the head of the Catholic party. The death of the king, and a strong party against him, drove him from the court, but he was soon recalled to take the command against the Huguenots, who had taken several important towns, and were committing great ravages. He retook Rouen, and conquered at Dreux (1562). The maréchal St. Andre was killed, the prince of Condé and the constable taken prisoners. Guise, the greatest of his name, was assassinated before Orleans, Feb. 24, 1563. He had a taste for literature, and his memoirs, written by himself, have much historic interest.

Henri I. of Lorraine, third duke of Guise, was b. Dec. 31, 1550. The death of his father placed him at the head of the Catholic party. Ambition and vengeance both stimulated him to action. At the age of 16 he distinguished himself in fighting against the Turks in Hungary. Three years later he fought with the Huguenots at Jarnac (Mar. 1569) and Moncontour (Oct. 1569), and in the same year forced Coligny to raise the siege of Poictiers. He aspired to the hand of Marguerite of Valois, but, to appease the anger of the king, married Catherine of Clèves, 1570. Disgusted with the favors granted to Protestants at the court, he retired, but returned, and was engaged in the massacre of St. Bartholomew, Aug. 24, 1572, in which he saw the dead body of Coligny thrown from the window into the courtyard at his feet. In 1575, fighting with the Huguenots, he was wounded in the face, whence he received the name of *balafré* (scarred), a designation borne also by his father from a similar circumstance. He formed the famous league—ostensibly for the defense of the church, really to raise himself to the throne of Charlemagne. The king coquetted with both parties. Guise conquered Henri of Navarre, but the king refused him entrance to Paris. The people rose in his favor, and he might have been king, but he negotiated. He was promised all the powers which he demanded, but the king caused him to be massacred in the palace, and is said to have kicked his lifeless body. His brother the cardinal was also killed. Their bodies were burned, and the ashes scattered to the winds, Dec. 23, 1588.

Henri II. of Lorraine, fifth duke of Guise, was b. April 4, 1614. He was des-

tined for the church, and at the age of twelve possessed nine abbeys: at fifteen he was archbishop of Reims, but on the death of his elder brother he quitted a calling he detested, and succeeded to the dukedom. Handsome, chivalric, brave, he was a true specimen of the ancient paladin, and celebrated for his numerous gallantries. Loved by Anne de Gonzague, princess of Mantua, he capriciously abandoned her, joined the party of the comte de Soissons, and married the widow of the comte de Bossut. Having joined the league against Richelieu, he was condemned by the parliament of Paris to capital punishment, but took refuge in Germany. On the death of Louis XIII. he returned to France, disgusted with his wife, whose fortune he had spent, and proposed to marry mademoiselle de Pons, one of the queen's maids of honor. He fought in the campaigns of 1644 and 1645 as a volunteer, and then repaired to Rome to get a divorce, but failed. Hearing of the revolt of Naples against Spain, under Massaniello, he set off for that city, in the true spirit of knight-errantry, to conquer a kingdom with his sword for the bride he still hoped to gain. Passing in a felucca through the Spanish fleet, Guise entered Naples in Dec. 1647, and was received with the utmost enthusiasm; but his gallantries, the envy of the nobles, and jealousy of France, caused him to be betrayed, in April 1648, to the Spaniards, and he was carried a prisoner to Spain. Demanded by Condé, he was set at liberty in 1652, and joined, with Condé, the enemies of the court and of Mazarin at Bordeaux. Two months later he had betrayed his allies, and was at Paris with the king, but misfortune still followed him, and he found that his mistress, for whom he had endured so much, was false, and that with his own esquire. Finding himself an object of ridicule at Paris, he attempted to return to Naples, but failed; returned to Paris, was made grand-chamberlain, there directed the magnificent fêtes of Louis XIV., and died without children in 1664. His *Mémoires* (2 vols., Par. 1669) were really written by his secretary, St. Yon.

Henry II. was succeeded by his nephew Louis Joseph, duke of Guise, Joyeuse, and Angoulême. With the son of the latter, François Joseph, who died in 1675, the direct line of the dukes of Guise of the house of Lorraine became extinct. The family possessions passed to the Condé, as being the nearest of kin amongst French houses. Charles, duke of Mayenne, one of the most zealous leaders of the league, was a member of the house of Guise. He died in 1611. Of the descendants of Henry I., the most notable were Charles, who inherited his father's dignities, and died in Italy, whither he had been banished by Richelieu, in 1640; and Claude, duke of Chevreuse, whose wife was Maria von Rohan-Montbaz, widow of the constable de Luynes (died 1679). Louis de Lorraine, cardinal de Guise (born 1580; died 1621), was a nephew of the fifth duke of Guise. Entering the church against his inclination, he became archbishop of Rheims in 1615. He had five illegitimate children by a mistress of king Henry IV. See Bouillé, *Histoire des Ducs de Guise* (4 vols., Par. 1850).

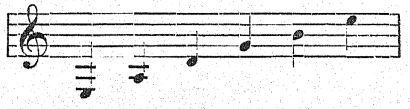
GUISE, Charles de Lorraine, Duc de, 1571–1640; son of Henri and great-grandson of the first duke. He shared in the plots of the league against the duke of Mayenne; afterwards supported Henry IV. and became governor of Provence. After Henry's assassination he went over to the Medici party and was compelled to expatriate himself.

GUISE, Louis de Lorraine, Cardinal de, 1555–88. He was archbishop of Rheims, and in 1578 a cardinal. In the plots of the league he took a leading part whereby he made a bitter enemy of Henry II., by whose order he was assassinated.

GUISE, Louis de Lorraine, Cardinal de, 1580–1621; archbishop, and in 1615 a cardinal. He was more inclined to military than church life, and was sent to the Bastile for some connection with a duel.

GUISE, Louis Joseph de Lorraine, Duc de, 1630–71; succeeded to the dukedom in 1664. He was the husband of a daughter of Gaston, duke of Orleans. He died without issue, and the estate descended to the daughter of Charles, the fourth duke. She too died without children.

GUITA'R, a musical stringed instrument, somewhat like the lute, particularly well adapted for accompanying the human voice, and much esteemed in Spain and Italy. It has six strings, tuned as follows:



and the sound is produced by the fingers of the right hand twitching the strings, while the fingers of the left hand make the notes of the music on the finger-board, which has frets across it like the lyre. The three highest strings of the guitar are always of gut, and the three lowest are of silk spun over with silvered wire. The greatest virtuosi on the guitar were Giuliani, Sor, Zoechi, Stoll, and Horetzky.

GUIZOT Elizabeth Charlotte Pauline de Meulan, 1773–1827; wife of Guizot, the historian, and herself devoted to literature, from an early age. In 1801, she edited a literary journal. In 1807, in consequence of poor health, she accepted the aid of an unknown writer who soon became known to letters, and married her. This was Fran-

çois Pierre Guillamme Guizot, who was 14 years her junior. Her after life was employed in works designed for the intellectual improvement of young persons.

GUIZOT, François Pierre Guillaume, a French statesman and historian, was b. at Nîmes, Oct. 4, 1787. His parents were Protestants; his father, who was an advocate, perished on the scaffold, April 8, 1794, and his mother soon afterwards went, with her two sons, to Geneva, where Guizot received his education. In 1805 he went to Paris, and devoted himself to literature. His first work, the *Nouveau Dictionnaire Universel des Synonymes de la Langue Française* (2 vols.; 4th ed. Paris, 1848), appeared in 1809; the introduction reveals a very methodical mind. The next seven years were spent in laborious literary activity. After the second restoration, he became general secretary to the ministry of the interior, afterwards to the ministry of justice. On the retirement of Barbé-Marbois, Guizot tendered his resignation, and was first appointed *maître des requêtes*, afterwards councilor of state. Guizot contributed to the dissolution of the *Chambre Introuvable*, by writing a memorial which was placed in the hands of Louis XVIII. by Decazes. The latter committed to him the general direction of the administration of the *communes* and *departements* (1819). His writings from 1820 to 1822 are entitled *Du Gouvernement de la France depuis la Restauration et du Ministère Actuel* (1821), *Historie des Origines du Gouvernement Représentatif*, containing his lectures at the Sorbonne (where he held the position of lecturer on history) of 1820–1822 (new ed. 1852). Government forbade his lectures in 1824, and Guizot again betook himself to literature. In conjunction with several other men of letters, he published the important *Collection des Mémories Relatifs à l'Historie de France, depuis la Fondation de la Monarchie jusqu'au 13me Siècle* (31 vols., Paris, 1823–1833); and the *Collection des Mémoires Relatifs à l'Historie de la Révolution d'Angleterre* (26 vols., Paris, 1823). He likewise edited several works of other authors, with introductions, annotations, and additions, such as Letourneur's translation of Shakespeare (12 vols., Paris 1821), Hallam's *History of England*, and Mably's *Observations sur l'Historie de France*, followed by the *Essais sur l'Historie de France*. In addition to all these, he published his *Historie de la Révolution d'Angleterre* (2 vols., Paris, 1826; 4th ed. 1845), and edited the *Encyclopédie Progressive*, and the *Revue Française*. In the following year the Martignac ministry granted him permission to resume his course of lectures on history. These were attended by a large and enthusiastic audience, and gave rise to several historical works of great value, published under the collective title of *Cours d'Historie Moderne* (1828–1830); among others, the *Historie de la Civilisation en France depuis la Chute de l'Empire Romain jusqu'à la Révolution Française* (5 vols., Paris, 1828–1830; 5th ed. 1845), and the *Histoire Générale de la Civilisation en Europe*, etc., which serves as an introduction to the former work. On Mar. 1, 1829, he again took his place in the council of state, and in Jan., 1830, was elected by the town of Lisieux, which he continued to represent in the chamber.

After the July revolution, Guizot became successively minister of public instruction and minister of the interior, an office which he held, with two interruptions, till 1836. In this capacity he did much for the improvement of educational institutions, particularly the primary schools. On the breaking out of the eastern disturbances in the beginning of the year 1840, under Soult's administration, Guizot was sent as ambassador to London. After Soult's retirement, in Sept., 1847, he became the official leader of the cabinet, which maintained its ground, as the organ of Louis Philippe's policy, till the Feb. revolution of 1848, and by its conduct both in home and foreign affairs, did much to bring constitutional government into disrepute, and to hasten the overthrow of the Orleans monarchy. As a statesman, Guizot in carrying out his systematic and repressive line of policy, proved himself stiff, one-sided, and latterly obdurate; from these qualities, as well as from his cold and disagreeable manner, he was always unpopular to the last degree with the nation. As a man of rectitude and austere morals, he never enriched himself at the public cost; but nevertheless, from political motives, he allowed others to do so during his administration, in the most flagrant manner. After having effected his escape from Paris, he retired to London, where he was received with great respect. In April, 1849, he published a circular *Guizot à ses Amis*, in which he offered his services to the electors of France, but ineffectually. In the following Nov. he returned to Paris, where he continued to labor in conjunction with the heads of the monarchial parties. After a short visit to Louis Philippe in England in June 1850, he came forward in Paris as the main promoter of the fusion, and wrote likewise in the *Assemblée Nationale*. The *coup l'état* of Dec. 2, 1851, put an end to this career; and Guizot returned to England. By founding the *Comités Historiques*, by bringing about the publication of important historical documents, and by his own writings and lectures, he did much to extend a taste for historical studies in France. In 1837 he was intrusted by the government of the United States with the task of writing a history of Washington. His work, published under the title *Vie, Correspondance, et Ecrits de Washington* (2 vols., Paris, 1839–40), procured him the honor of having his portrait placed in the chamber of representatives at Washington. After the Feb. revolution Guizot published several political treatises, more or less important, some of which at least are very interesting to Englishmen, such as *Revolution d'Angleterre*, and *Monk, Chute de la Republique*. He likewise wrote *Méditations et Etudes Morales sur la Religion, la Philosophie*, etc. (1852); *Corneille et son Temps* (1852); *Shakespeare et son Temps* (1852). In 1858, appeared his *Mémories pour servir à l'Historie de*

mon Temps. His publication in 1861, defending the temporal power of the pope, was a strange one for a Protestant. Among the most important of his later works are *Méditations sur l'Etat Actuel de la Religion Chrétienne* (1865); *Mélanges Biographiques et Littéraires* (1868); *Mélanges Politiques et Historiques* (1869), etc. Guizot was thrice married; his first two wives were accomplished women, and not unknown in literature. He died Sept. 12, 1874. After his death was published *l'Historie de France depuis les Temps les plus reculés jusqu'en* 1789; *racontée à mes Petits-Enfants*.—His son, MAURICE GUILLAUME, has shown by his *Ménandre Etude Historique sur la Comédie et la Société Grecques* (1855), that he is not destitute of his father's genius.

GUIZOTIA. See RAM-TIL.

GUJERAT. See GUZERAT.

GUJRÁNWÁLA, a British district in the Punjab, India; 2,563 sq.m.; pop. '68, 550,576. It forms the central portion of the Rechna Doáb, intermediate between the fertile submontane plains of Siálkot and the desert expanses of Jhang. On the northern frontier, a belt of alluvial land, from 2 to 6 m. in breadth, fringes the Chenáb throughout its course. The southern portion of the plateau has a rich soil, with accessible water; the villages here lie close together, while the people are industrious cultivators. But further s. the ground becomes harder and drier until in the extreme s. the *bar*, a flat expanse of barren land, passes slowly into the desert of Jhang. In the s.e. corner of the district the little river Degh irrigates and fertilizes a tiny valley of its own. Two or three minor watercourses are used for the purpose of irrigation in the villages through which they pass. The country is bare of trees, and the scenery throughout is tame and in the central plateau becomes very monotonous.

GULDEN. See FLORIN.

GULES (Fr. *gueules*, the mouth and throat, hence red. Other origins are given, such as the Persian *ghul*, a rose or rose color, which seems more probable than the Hebrew *gulude*, a piece of red cloth, from which Mackenzie derives it; it being scarcely likely that it came from a Semitic source), the term by which the color red is known in heraldry. In engraving it is marked by perpendicular lines traced from the top of the shield to the bottom. See HERALDRY. It is supposed to indicate valor, magnanimity, and the like, and is regarded as the most honorable heraldic color.

GULF STREAM AND OCEAN-CURRENTS. The most important and best known of the great ocean-currents derives its name from the gulf of Mexico, out of which it flows, between the coast of Florida on the one side, and the Cuba and the Bahama Islands and shoals on the other. With a breadth of about 50 m. in its narrowest portion, it has a velocity at times of 5 m. an hour, pouring along like an immense torrent. This great ocean-river flows in a north-easterly direction along the American coast, gradually widening its current and diminishing in velocity, until it reaches the island and banks of Newfoundland, when it sweeps across the Atlantic, and divides into two portions, one of which turns eastward towards the Azores and coast of Morocco, while the other laves the shores of the British islands and Norway, and can be perceived on the southern borders of Iceland and Spitzbergen, nearly as far e. as Nova Zembla.

The waters of the gulf stream are of a deep indigo blue, with boundaries sharply defined against the light green of the seas through which it passes in its early course. It abounds with masses of sea-weed, torn from the coral rocks of the strait through which it passes when it has its greatest power and velocity; while in its warm current may be seen myriads of fish and of animalculæ. As this great stream pours out of the gulf of Mexico, it has a warmth of 84° in summer, being 4° higher than that of the ocean at the equator. In mid-Atlantic, opposite Nova Scotia, it has fallen at all seasons only about 14°; while the British islands and north-western coasts of Europe, at a distance of 4,000 m. from the gulf, are bathed with waters heated under a tropical sun, and have their temperatures raised in winter about 30° above the normal temperature of the latitudes. In mid-winter, off the inclement coasts of America, between cape Hatteras and Newfoundland, ships beaten back from their harbors by fierce north-westers, until loaded down with ice and in danger of foundering, turn their prows to the e. and seek relief and comfort in the gulf stream. A bank of fog rising like a wall, caused by the condensation of warm vapors meeting a colder atmosphere, marks the edge of the stream. The water suddenly changes from green to blue, the climate from winter to summer; and this change is so sudden, that when a ship is crossing the line, a difference of 30° of temperature has been marked between the bow and the stern.

The great differences of temperature between the western shores of Europe and the eastern shores of America have been attributed, too largely, perhaps, to the influence of the gulf stream. There is no doubt that such an immense body of heated water in the north-eastern Atlantic must raise the temperature of the atmosphere, and that to this importation of the effects of tropical sunshine by sea is due, to a certain extent, Ireland's perpetual green, the soft, moist climate of England and Scotland, and the fact that the harbors of the western and northern coasts of Norway, as far e. as Varanger Fjord, remain open, when the Baltic, much further s., is a sheet of ice. England, clothed

in perennial verdure, and Scotland, where the grass grows during 11 months of the year, are in the same latitude as the frozen and horrible coast of Labrador. Norway is opposite Greenland; and Lisbon, where frost is scarcely known, is in the same latitude as Washington, where the Potomac river, a mile in breadth, sometimes freezes over in a single night. This difference is to be ascribed, not to the gulf stream alone, but to that in conjunction with the prevailing south-westerly winds. The Mediterranean, exposed to no cold currents from the arctic regions, bearing bergs and fields of ice, is a constant receiver and distributer of heat, and modifies the temperature of adjacent regions. North America, on the contrary, is exposed along its eastern shore to a great current from the polar seas, running inside and counter to the gulf stream, and coming loaded with ice from the northern regions; and while the continent narrows towards the tropics, it grows broad in the polar regions, from which come the cold north-westers, the prevailing winds during the wintry season.

The effect of the gulf stream upon temperature has been nowhere more strikingly observed than in high northern latitudes. Where the warm stream from the s.w. meets the arctic current in the latitude of Iceland, a difference of 17° has been observed.

In treating of the cause or causes of the gulf stream, we must take a general view of ocean-currents. Taken altogether, they form a connected system which has been aptly compared to the circulation of the blood. The two prime movers are differences of temperature and prevalent winds. Sea-water of average saltness does not freeze until it is cooled down to about 28°; and, unlike fresh water, it continues to grow heavier down to that point. The effect of the intense cold of the polar regions is thus to cause a constant sinking down of the surface-water, and to establish a current of ice-cold water along the bottom towards the equator; while to supply the place of what sinks down, an indraught or northward flow takes place on the surface, which brings the warm water of the temperate and tropical regions toward the poles. This is the general theory of the *vertical* circulation of the ocean—a circulation which might almost be assumed from the well-known laws of the flow of liquids, and which recent observations have established as a fact. The general prevalence of cold currents along the bed of the ocean from the poles to the equator is now beyond dispute. The soundings taken recently by H.M.S. *Challenger* show the temperature of the bottom water between Sombrero in the West Indies and Teneriffe to vary from 34°.4 to 35°.5; while at the equator it is in some places still lower, being only 32°.4. This is held to prove that the Antarctic bottom current extends to the equator and beyond it. Motion once thus begun, however, is differently modified in each locality by the shape of the coasts, by prevalent winds, and other circumstances. But one cause which modifies all currents that tend either n. or s., is the daily rotation of the earth. In the very same way that the rotation of the earth gives the trade-winds their peculiar directions (see WINDS), it causes the cold currents coming from the poles to turn towards the s.w., and the surface-currents from the s. to take a n.e. direction. At the equator, any spot on the surface is moving eastward at the rate of 1000 m. an hour; at 60° n. latitude, the velocity is only one half. Thus, the water of a current starting from the equator northward, is constantly coming to places where the bottom under it has less and less eastward velocity. But, by the law of inertia, the water tends to retain the same velocity eastward with which it started, and thus it moves to the e. of n.—shooting ahead, as it were, of the bottom over which it is flowing, as a rider does whose horse slackens his pace. The contrary happens to a stream flowing from n. to south. In this case, the eastward motion or motal inertia of the water is too slow for the parts of the bottom to which it successively comes; the bottom slips in a manner from under it, and it falls to w. of south. This, in combination with the action of opposing coasts, accounts for the circular sweep which many of the currents make, returning partly into themselves.

Different in origin from this vertical circulation, though partly mixed up with it, is the *horizontal* circulation caused by prevalent winds. The best example of this is the equatorial current, which sets from the w. coast of Africa to the e. coast of Brazil, and which is owing to the action of the trade-winds. Currents caused by winds are called "drift-currents," in opposition to the deeper-seated "stream-currents." In order to feed this westerly equatorial current, there spring up two *in-draught* currents, which also follow the prevailing winds of their respective regions—the one from the n. along the w. coast of Portugal and Morocco, the other from the cape of Good Hope along the w. coast of Africa, as far as the gulf of Guinea. When the equatorial current reaches the coast of Brazil, it divides into two branches. One proceeds southwards, turning gradually eastwards across the Atlantic until it falls in with the northern in-draught from the cape of Good Hope. The other branch is deflected northwards into the Caribbean sea and the gulf of Mexico. The water thus driven into this pent-up sea now rushes with accumulated momentum through the strait or gulf between Florida and the Bahamas, and forms the famous gulf stream.

It has usually been held that the gulf stream extends across the Atlantic to the shores of northern Europe, and is the cause of the mild and moist climate enjoyed by the western parts of that continent. The opinion, however, is beginning to prevail that, as a distinct current, the gulf stream ceases in the middle of the n. Atlantic, its waters being by this time thinned out to a mere film, and its initial velocity and distinctive heat having been dissipated. That warm waters from tropical seas are brought

to the coasts of Britain, and even into the polar seas beyond, is proved by drift-wood, seeds, and fruits from the West Indies being frequently cast ashore on the Hebrides, the n. of Norway, and Spitzbergen. But this is accounted for by the general flow of the surface-water towards the poles, forming part of the vertical oceanic circulation, a flow which receives an eastward deflection as it proceeds northwards, in the way above explained. This general set of the surface-water is further promoted by the prevalence of south-westerly winds, which maintain a pretty constant n.e. *drift* over the whole surface of the north-eastern portion of the Atlantic. In this way, although the gulf stream may have lost its original impetus, a large portion of the super-heated water which it brings into the center of the Atlantic is carried to the shores of Europe and into the Arctic sea.

The Pacific ocean has also its great equatorial or trade-wind current, but there is no great basin like the gulf of Mexico to gather the waters of another gulf stream. A portion of the equatorial current passes northward along the shores of China and Japan; a portion passes through the narrow channels of the Indian seas, and another portion turns southward towards Australia and New Zealand, affecting, doubtless, the isothermal lines in those latitudes, and returning in counter-currents to cape Horn, and even passing around it into the Atlantic. While thus a portion of the great counter or polar current of the south Pacific sweeps around cape Horn, another portion passes up the western coast of South America across the equator to 5° n. lat.; and its coolness is sensibly felt, and was carefully observed by baron Humboldt on the coast of Peru. The currents in the waters between the Pacific and Indian oceans are also variously affected by the monsoons, and in some places run six months in one direction, and six months in the opposite, clearly proving that they are mainly dependent upon the direction and force of the winds. A chart of ocean currents was published by the admiralty in 1872 which proves beyond a doubt that it is almost wholly to the prevailing winds we must look for an explanation of ocean currents.

At first sight it appears incredible that a current of water should force its way through the ocean with sharply defined boundaries, and a peculiar color, temperature, and inhabitants, like a great river flowing between its banks, for thousands of miles and against the force of counter-currents, which even cross its course, passing under by their superior density, until it loses its momentum on the shores of distant continents, or spreads out its warm flood on the bosom of northern seas. But a closer observation will satisfy us that all this is in accordance with the laws of hydrodynamics. At the confluence of the clear waters of the Mississippi with the turbid current of the Missouri, the two rivers do not at once unite, but run side by side with a sharply defined boundary between them for many a league. So great rivers running into the ocean, are rivers still, far out at sea. The current of the Rio de la Plata, which drains the southern portion of South America, can be perceived 200 m. from land; and the Amazon sweeps far into the Atlantic, though gradually bent northwardly by the great trade-wind current, and then carried along the coast, to help, with the Orinoco, to swell the waters of the gulf of Mexico; so that the waters of the Amazon, the Orinoco, the Rio Grande, and the Mississippi, all join to swell the gulf stream.

The channel of the gulf stream in its narrower portion is of great depth. From observations made by the *Challenger* in 1873, in that part of the stream between Bermuda and New York, it is seen the gulf stream is there about 100 fathoms deep, and 80 m. in width. The probability of its having hollowed out for itself a well-defined channel like the bed of a river, is shown by a sudden increase of depth at its border, where deep-sea soundings have been made; but so little can be known of the effect of currents upon a line of 20,000 ft. in length, and which require several hours to run off the reel, that we cannot place implicit reliance on such observations.

More important observations on the courses and influence of these currents have been lately undertaken by dropping bottles containing the date, latitude, and longitude, in all parts of the ocean. These bottles, when found upon the coast thousands of miles distant, give some indication of the direction and velocity of the currents that have brought them; but such testimony is not infallible. The bottle may be impeded by contrary winds, blown into counter-currents, or whirled about for months in eddies. A bottle thrown overboard in the Indian ocean might reach the island of Spitzbergen, *viâ* the gulf of Mexico; but there are many chances that it would be thrown out of the regular current, and be picked up on the shores of New Zealand or the coast of Peru. See Dr. Franklin's *Maritime Observations*, Pownall's *Hydraulic and Nautical Observations*, Humboldt's *Atlas Geographique et Physique*, Johnston's *Physical Atlas*, Maury's *Physical Geography of the Seas, and Wind and Current Charts*, and admiralty wind and current charts for Pacific, Atlantic, and Indian oceans.

GULFWEED (*sargassum*), a genus of sea-weeds (*algæ*) of the sub-order *fucaceæ*, of which two species (*S. vulgare* and *S. bacciferum*) are found floating in immense quantities in some parts of the Atlantic, Pacific, and Indian oceans. They are tropical plants, although sometimes carried by winds and currents to the British coasts. The frond is very long, and is furnished with distinct, stalked, nerved leaves, and simple axillary stalked air-vessels. The receptacles are linear, in small axillary clusters or racemes. The trivial name *bacciferum* applied to one of the species, is derived from the berry-

like appearance of the air-vessels. The gulfweed has only been found floating, but there is reason to think that it is at first attached to the bottom of comparatively shallow parts of the sea. It floats in large fields, or more frequently in long yellow lines in the direction of the wind. In crossing the Atlantic, its presence is regarded as a sure indication of the gulf stream, by which it is wafted northward and eastward. Where the gulf stream is deflected from the banks of Newfoundland eastward, and sends off its more southern branch towards the Azores, is situated the *Sargassa sea*, "that great bank of weeds, which so vividly occupied the imagination of Christopher Columbus, and which Oviedo calls the sea-weed meadows" (*Humboldt*). The quantity of floating sea-weed is often such as to impede the progress of ships. Multitudes of small marine animals accompany it, with fishes ready to prey on them. The gulfweed is eaten in China; and in other parts of the east also, it is used in salads and as a pickle.

GULIEL'MA, a genus of South American palms, with pinnate leaves (entire in young plants), natives of the lower mountain-ranges of Peru and New Granada. One species, Gulielma *speciosa*, is much planted by the Indians of the Amazon district and of Guiana, and Venezuela, near their villages, and supplies them with food and other necessaries. It is often 60 ft. high, having an erect slender stem, encircled with many rings of needle-like spines, and numerous drooping leaves forming a nearly spherical crown. It is variously called *papunha paripou*, etc; and sometimes *peach palm*.

GULL, *Larus*, a genus of web-footed birds, of the family *laridæ* (q. v.), inhabitants of the sea-coasts of all parts of the world. The feet have three toes in front completely united by a web, and a small hind-toe not included in the web, and sometimes altogether wanting. The wings are long and pointed. Gulls have great power of wing, and fly apparently with ease against a storm, during the continuance of which they generally fly low, whether over sea or land, but in fine weather soar higher in the air, in which they seem to delight in performing the most varied and beautiful evolutions. They descend with great rapidity to seize prey from the surface of the water or at a small depth; but they are not good divers, and the fishes which they catch are chiefly those which, like the herring and others of the same family, swim near the surface. They are very voracious. Their food consists of almost anything animal. Many of them are wholly or partially migratory, breeding in colder regions than those which they inhabit in winter. In general, they lay only two or three eggs, which are large for the size of the bird.

Many of the gulls are frequent visitors of inland districts, ascending rivers, and hovering over them in quest of prey as over the sea. Some of them are also often to be seen in meadows and plowed fields, seeking for worms and other such food. It is a common notion in Britain that the appearance of gulls in inland districts betokens stormy weather. But in America, the migrations of some of the species between the northern seas and the gulf of Mexico are performed, not only along the Atlantic coast, but by the great lakes and the valleys of the Ohio and the Mississippi, and a few occasionally remain and breed near these inland waters. Large flocks of a species of gull (*L. serranus*) frequent the lakes of the high table-lands of Peru.

Some at least of the larger gulls break the shells of mollusks by taking them up to a sufficient height in the air, and dropping them on a rock. This interesting fact is attested by Audubon, the American ornithologist, as having come under his own observation, and he mentions an instance in which a gull, finding the shell not broken by the fall, carried it up a second and a third time, and each time higher than the former.

The flesh of gulls is rather coarse, but that of the young is in request on many northern coasts as an article of food, and is salted for winter use. The eggs of certain species, such as the black-headed gull, are said to be very palatable, and are collected in great quantities in some places where these birds breed in large numbers.

The plumage of gulls is generally in great part white, variously mixed with gray, slate-color, brown, and black. The white, in some species, assumes a rosy tint in the breeding season; and the head of some becomes black. The differences of plumage, according to age and season and sex, are very considerable, and have led to many errors as to species.

One of the most common British species is the BLACK-HEADED GULL (*L. ridibundus*), the whole length of which is about 16 in.; another is the COMMON GULL or SEA MEW (*L. canus*), mostly of a gray color above, and white below, fully 18 in. long; the HERRING GULL (*L. argentatus*), a still larger species, is common on rocky coasts; the KITTIWAKE (*L. tridactylus* or *L. rissa*), rather smaller than the first-named species, gray and white, destitute of hind-toe, is plentiful where the coast is girt with rocky precipices, on the narrow ledges of which it makes its nest; its young and eggs are among the chief objects of pursuit of the rock-fowlers; the LESSER BLACK-BACKED GULL (*L. fuscus*), about 23 in. long, is pretty common, at least in the n.; the GREAT BLACK-BACKED GULL or WAGEL (*L. marinus*), nearly 30 in. long, is not rare; and the GLAUCOUS GULL or BURGOMASTER (*L. glaucus*), scarcely inferior to it in size, though by some supposed to be identical with the great black-backed species, of a pale bluish-gray color above, and white below, is a winter visitant from the arctic regions. This species seems to have acquired its name of burgomaster from the superiority which, in virtue of its size and strength, it asserts over most of the smaller birds of the northern seas, compelling them

to relinquish prey at its approach. Some of the British species of gull are also common in North America, as the HERRING GULL and the GREAT BLACK-BACKED GULL and the KITTIWAKE; but the COMMON AMERICAN GULL (*L. zonorhynchus*) is not found on the eastern shores of the Atlantic.

GULL, Sir WILLIAM WITHY, b. England 1816; graduated in medicine at London university; professor of physiology at the royal institution, and fellow of the royal college of physicians. He was for twenty years physician to Guy's hospital. In 1872 he was made a baronet. He is president of the clinical society, member of many other associations, and the author of several works on medical subjects.

GULLET. See ESOPHAGUS.

GULUN'CHA, *cocculus cordifolius,* a plant of the same genus which yields calumba (q.v.), extensively used in the East Indies as a tonic and febrifuge. It is largely cultivated in some parts. It is a climber, with heart-shaped leaves. It exhibits a wonderful tenacity of life. When it has acquired the diameter of half an inch, it is not unusual to cut from the main stem a portion of from 20 to 30 ft. in length, when the part sustained by the branches of the tree sends down threads to the ground, which take root, and become new stems. To plant it, a few yards of the stem are merely made into a coil, and hung on the branch of a tree (Tennent's *Ceylon*).

GUM, a general term applied to certain exudations from trees and plants, which are very different in their chemical characters and their general properties. In its strictest sense, gum is a substance which dissolves in water, forming a transparent mucilage; it is insoluble in ether, alcohol, and oils, either fixed or volatile, and is convertible into oxalic acid by the action of sulphuric acid. The gums belonging to this class are:

1. *Gum arabic,* which is gathered from the stems of *acacia arabica* or *acacia vera,* two leguminous trees found in northern Africa, and in some parts of Asia. It varies in color from a light straw to a garnet red, and is more or less transparent: the lightest is always the best. It is imported from Barbary and Turkey.
2. *Barbary gum,* a dark-colored variety, also imported from the Morocco coast. It has some qualities which render it particularly valuable to confectioners, in the manufacture of lozenges, etc. It is the produce of another species of acacia, *A. gummifera.*
3. *Gum gedda,* an inferior quality of Barbary gum.
4. *Gum senegal* is in fine large, round tears, generally larger than the finest gum arabic; it is, however, darker in color, being a sherry brown, with sometimes a slight pinkish tint perceptible on the surface of the drops or tears. It is found generally in the tropical parts of the western coast of Africa, and is yielded by two species of acacia, viz., *A. senegal* and *A. seyal.* It is much valued for dressing various textile fabrics, such as muslins and silks, and is also used by confectioners for the finest kinds of lozenges, etc. The *acacia arabica* is also found in the East Indies, and is supposed to yield, with other species, the following gums known in commerce.
5. *Gum gattie,* which is imported very largely, and is produced in the Deccan, Concan, and in Guzerât.
6. *Gum babool,* an inferior gum, imported from Bengal.
7. *East Indian gum,* a tolerably good variety, imported from Bombay.
8. *Gum oomrawuttee,* an inferior variety, from the province of Oomrawuttee.

These East Indian gums are all dark colored, and are much inferior to those produced in Africa; they are, however, extensively imported into the ports of London and Liverpool; over 200 tons are annually received into those ports.

The gums above described principally consist of a material which chemists have called *arabin,* from its being the chief constituent of gum arabic. We now come to another class of gums, in which another material, called *bassorin,* from its being first noticed in an analysis of *gum bassora,* is more or less present. These are:

1. *Gum tragacanth,* or dragon, yielded by the leguminous shrub *astragalus tragacantha;* it was known to the ancient Greeks under the name of *tragakantha.* The finest pieces are in flakes, from an inch to an inch and a half in length, and from half an inch to an inch in width. This gum is more or less white, and nearly opaque, that which is whitest and most opaque being the best. It is only partly soluble in water, forming a white paste, instead of a transparent solution; with vinegar or dilute acetic acid it also forms a similar paste, and is a valuable cement, holding light materials with great tenacity. It is used as a stiffening material for various textile fabrics, and is much valued for this purpose, where it is not desired to give gloss to the material. We receive it chiefly from Smyrna and Constantinople. It is mostly produced in northern Persia and Asia Minor.
2. *Gum kuteera,* yielded by *sterculia urens* on the Coromandel coast. It is now only an occasional import, though formerly a considerable quantity was brought to this country.
3. *Gum bassora.*—This is imported from Bassora; hence its name; but although long known in commerce, it has not been satisfactorily determined what plant produces it. Only a very small quantity reaches this country from time to time.
4. *African or Sierra Leone tragacanth.*—This is occasionally imported in small quantities from western Africa, and is produced by *sterculia tragacantha.*

Besides the true gums, there are the

GUM-RESINS, which are much more mixed in their chemical constituents; in general terms, however, they may be said to consist of certain resins soluble in alcohol, and of the true gum, so that it requires both water and alcohol to dissolve them entirely. They are chiefly used in medicine and perfumery, and may be said to form a connecting link between the true gums and the true resins, commercially speaking. The principal are:

1. *Gum asafœtida.* See ASAFŒTIDA. 2. *Gum benzoin* or *benjamin.* See BENZOIN. 3. *Gum styrax* or *storax* is another sweet-scented gum-resin, produced by *styrax officinalis* in Turkey in Asia. It is usually liquid, of the consistence of treacle, and a blackish or dark-gray color. It is also used in perfumery. 4. *Gum sagapenum*, another medicinal gum with unpleasant garlic-like odor, dark-brown color, and a soft consistency. It is not known what plant produces it, but it is generally supposed to be obtained from a *ferula.* 5. *Gum galbanum.* See GALBANUM. 6. *Gum opopanax* is yielded by the roots of another umbelliferous plant, *opopanax chironium.* It comes from the Levant in reddish-yellow lumps of a disagreeable smell. Its only use is in medicine, chiefly for plasters. 7. *Gum ammoniacum.* See AMMONIACUM. 8. *Gum myrrh* is a very sweet-smelling gum resin, which exudes from the stems of an Abyssinian shrub, the *balsamodendron myrrha.* Two distinct kinds are known in commerce, the Turkish and the East Indian; the former is the better. They are both in irregular-shaped small lumps, rarely exceeding the size of a walnut, of a reddish-brown color, rather lighter in the Turkish sort. Considerable quantities are used in medicine, and in perfumery for dentrifices, washes for the teeth, etc., in consequence of its being supposed to possess considerable antiseptic properties, and for the agreeable odor it imparts to the breath. From 15 to 20 tons are imported annually. 9. *Gum scammony.*—This is obtained from incisions made purposely in the crown of the great tap-root of the *convolvulus scammonia,* which is bored for the purpose. It is of a dark sap-green color, inclining to greenish-gray, in large and small cakes, and in irregular fragments. Its use is extensive as a mild and safe purgative for children, but scarcely any drug has been so uncertain in its operation, owing to the excessive adulteration practiced upon it by the Turks previous to its shipment. This has now been obviated by importing the root itself, and extracting the gum in this country.

There are many other gums known, but these are the ones to be had in shops, and for which uses are found in the arts, manufactures, and in medicine. Many also of the true resins, as copal animi, etc., are called gums, but they are strictly *resins.* See RESINS.

Gum-substitutes are manufactured from wheat-starch, farina or potato-starch, sago-flour, and other feculas, by baking or roasting, so as to convert the starch into dextrine (q.v.). This is now an important manufacture, in which a large amount of capital is engaged. They are made on a very extensive scale by the Messrs. Laing of Manchester and others, and are largely employed in dressing calicoes and other fabrics, also as a substitute for the more expensive gums in gumming paper, as in the case of postage and receipt stamps, which are made adhesive by dextrine. For this and some other purposes, the *gum* substitutes are superior to the real gums, as they are easily dissolved, and can be spread more equally over a smooth surface. Very large quantities of the starch of potatoes, called farina or potato-flour, are made in this country, and are also imported from the continent to be used in this manufacture.

GUMBIN'NEN, a thriving t. of Prussia, in the province of Prussia, is situated on both banks of the Pissa, one of the affluents of the Pregel, 68 m. e.s.e. of Königsberg. It was first regularly laid out in 1724, and owes its rise and prosperity in great measure to the settlement here of many Protestants, chiefly from Salzburg, who were driven from their homes by religious persecution. Among other institutions, the town has a gymnasium, a public library, three Protestant churches, and two hospitals. Woolen-cloth weaving, brewing, and distilling, are the branches of manufacture. Pop. '75, 9,116.

GUMBO, a kind of soup, prepared from okra, and much in vogue in the southern states. It is made in various ways, sometimes containing considerable animal flesh, the most favorite being chicken. Gumbo soup proper, however, is composed principally of okra with portions of other vegetables added according to the taste, as rice or pearl-barley. The name is thought by some to have originated with the slaves, but that is doubtful. See OKRA.

GUM-BOIL, an abscess (q.v.) near the root of a tooth, and discharging itself towards the mucous membrane of the gum; usually superficial, but sometimes more deeply seated in connection with the bone, and causing considerable deformity, with risk of caries (q.v.) or necrosis (q.v.). Gum-boil should be treated, in the first instance, by simple protection against cold and external injury; but as soon as the presence of matter can be ascertained, it is usually good practice to give vent to it by a pretty free incision.

GUM TREE. See EUCALYPTUS and TUPELO.

GUM'MEL, a t. of Africa, in the state of Bornu, in lat. 12° 38′ n., and long. 9° 21′ east. In 1851, on the occasion of Dr. Barth's first visit to Gummel, he found it a flourishing town, the great entrepôt for the natron trade, with a weekly market, at which were 300 stalls, offering for sale all sorts of clothing, tools, pottery, victuals, cattle, horses, etc., and with a population of 10,000; but in 1854, on visiting it on his return journey, he found that, during the interval, it had suffered severely from civil wars, and was then in a state of at least temporary decay.

GUMMING, a disease analogous to *canker* (q.v.), and like it, very destructive to fruit-trees, but confined to those the sap of which readily produces much gum; as the cherry, plum, peach, apricot, and almond. It is supposed sometimes to originate in wounds, in which a morbid exudation of gum takes place; but it appears to be more frequently occasioned by severe frosts, and to be very much dependent upon causes which induce a general unhealthiness. It very generally terminates in the destruction, not merely of the branch in which it originated, but of the whole tree, although trees in which it is in sure progress sometimes live for years, and meanwhile produce large crops of fruit. A small fungus (*næmaspora crocea*), which has been supposed to be the cause of gumming, more probably appears in consequence of it.

GUMRI, an old t. of Russian Armenia, on the site of which the important city and fortress of Alexandrapol—pop. '67, 17,272—have been built. The site is on the high-road to Erivan, and is 60 m. n.w. of that town. Alexandrapol is built at an elevation of 5,860 ft. above sea-level, and here the cold is so intense that men are often frozen to death in the fields.

GUM'TI, a river of India, remarkable, as its name is meant to express, for its windings, rises in a small lake in lat. 28° 35′ n., and long. 80° 10′ e., and after a south-eastern course of 482 m., enters the Ganges from the left in lat. 25° 29′ n., and long. 83° 15′ east. It is navigable for inland craft as far up as Lucknow, which is fully more than 300 m. above its confluence with the Ganges. At Jaunpore, about 56 m. from the Ganges, it is spanned by a bridge of 16 arches.

GUN, a term applied in its most general application to firearms of any description, but in the more restricted and technical sense to cannon (q.v.). A gun is a frustum of a right cone, with a cylinder excavated round the axis, to serve as a bore. Close home to the end of this cylinder, the powder is driven, and outside it is the ball to be expelled.

The trunnions are cast in one mass with the piece, and are placed in the second reinforce in such a position that the breech-end of the gun outweighs the muzzle. Their axis is generally about half their diameter below the axis of the piece. This locality has several conveniences; but for the maximum of steadiness in the recoil, it has been shown that the axes of the trunnions and of the gun should exactly intersect. The use of the trunnions is to suspend the cannon on its carriage in such a manner that it may be readily depressed or elevated, but so that it shall have no horizontal motion which is not shared by the whole carriage.

The vent or touch-hole, the channel through which the charge is fired, is a small cylindrical orifice leading at an angle from the breech of the bore towards the base ring. The explosion within reacts with great force on the lower portion of the vent, and in case of rapid or long-continued firing, soon honeycombs the iron or brass, often dislodging considerable fragments. This, besides diminishing the regularity of the action of the powder on the projectile, would involve danger of bursting if permitted to any great extent. The gun so affected is therefore *bouched*, that is, has a new vent constructed. The process consists of drilling a female screw, of larger than the required diameter, in the metal of the gun. Into this matrix, a bar of pure copper is screwed (copper being the metal least liable to fuse under the intense heat of ignited gunpowder), and the vent is then drilled through the copper. Sir A. Dickson devised the following simple mode: he rammed a cartridge of sand firmly into the breech, then filled the vent and all the interstices with molten copper, and had only to bore a hole through the latter to complete the operation. In cases of great urgency, even this simple procedure may be shortened by the insertion of the stem of a tobacco-pipe during the filling; the pipe, when removed, leaves a perfect vent.

With reference to rifled cannon, some particulars have already been given under ARMSTRONG GUN, and fuller details will be given under RIFLED ARMS. Under the heading CANNON will be found some details as to various kinds of heavy guns, as well as under the several headings LANCASTER GUN, MORTAR, SHELL-GUN, etc. The history of guns and gunpowder is sketched in the article FIREARMS. For the ordnance now in use in the British army and navy, see WAR SERVICES. The various kinds of small-arms are discussed under their respective heads, as ARQUEBUS, MATCH-LOCK, PISTOL, REVOLVER, RIFLED ARMS.

GUN-BOAT, a small boat or vessel armed with one or more guns of heavy caliber. From its small dimensions, it is capable of running close inshore or up rivers, and from the same cause it has little chance of being hit by a larger vessel at the long range which the carrying power of its guns enables it to maintain. On the outbreak of the Russian

war (1854–56), as the British navy was without a single gun-boat, a large squadron of them was hastily constructed in 1855 and 1856, but too late for that special war. From the haste with which they were put together, most of those vessels proved defective. Their tonnage was small; and their armament usually consisted of one 8-inch gun and one 100-pounder Armstrong gun. In the last two wars with China, gun-boats performed excellent service, having penetrated nearly to Peking, and far up the Yang-tze-kiang. Gun-boats in their more modern form are small mastless vessels mounting one large gun in the bow, and propelled by an engine with single or twin screws. The gun is pointed by means of the helm or the screws, and the gun-boat is in fact a floating gun-carriage. The *Staunch*, the first gun-boat built on this principle for our navy, has given her name to the whole class. In our navy these gun-boats carry an armor-piercing gun of 18 tons, on a draught of only 4 feet. But they have been designed to carry even 35-ton guns. Four have lately been built by Messrs. Armstrong for the Chinese navy —the *Alpha, Beta, Gamma, and Delta;* two of these carry a 25-ton gun, and two a gun of over 30 tons. A small flotilla of such gun-boats, protected only by their small size, would be in coast defense formidable opponents even for ironclads. At the beginning of the century the United States had over 250 of these vessels; but the "gun-boat system" was soon abandoned. Some of the continental navies are well provided with gun-boats.

GUN-CARRIAGE is a very important element in the equipment of each piece of ordnance. It requires to be of great strength, and at the same time of considerable weight, in order that the whole apparatus—gun and carriage together—may not be driven backward by the recoil in firing. Field-gun carriages have, besides, to bear an enormous strain in passing at a rapid pace over broken, uneven, or rocky ground. To provide for this severe wear and tear, every part is fitted with the utmost precision, made of well-seasoned material, and on strict mechanical principles. A large department, fitted with splendid machinery, in the royal arsenal at Woolwich, called the royal carriage department, is charged with this branch of manufacture for the British service. Carriages are of various kinds, according to the service for which they may be required. When a field-gun is to be moved, the trail-plate is hooked to the limber (q.v.), which converts the gun-carriage and limber into a 4-wheeled vehicle, capable of conveying the gun, its tools and ammunition, and several of its gunners. Information relative to certain species of gun-carriages will likewise be found under TRAVERSING PLATFORM. Among modern inventions of war is the Moncrieff or elevating gun-carriage, in which the gun is poised at the end of a lever pivoted on the carriage, and balanced by a heavy counter weight. Before firing, the gun is raised by mechanism; when fired, its own recoil drives it down upon the carriage. This arrangement enables gun and gunners to lie concealed behind a parapet until the moment of discharge.

GUN-COTTON, a detonating substance, invented by Schönbein in 1846, and obtained in the following manner: One part of finely-carded cotton is immersed in 15 parts of a mixture of equal measures of strong nitric acid (sp. gr. 1.5) and sulphuric acid (sp. gr. 1.845). The cotton must be completely immersed in the mixture, otherwise it becomes so hot as to undergo immediate decomposition. After a few minutes' immersion, it must be plunged into a large volume of cold water, and then washed till the moist mass ceases to show any acid reaction when placed on litmus paper. It is then to be carefully dried at a temperature not exceeding 170°.

Any substance containing cellulose, such as tow, linen, saw-dust, paper, etc., may be employed instead of cotton, and the change that takes place in the formation of the explosive compound seems, from the researches of Hadow, to be as follows: the composition of cellulose is represented by the formula $C_{36}H_{30}O_{30}$. In the formation of gun-cotton or *pyroxylin* (derived from *pyr*, fire, and *xylon*, wood), nine equivalents of the hydrogen are replaced by an equal number of equivalents of peroxide of nitrogen (NO_4), so that the formula for the new compound is $C_{36}H_{21}9NO_4,O_{30}$. The fiber, in undergoing this change, increases about 70 per cent in weight, and acquires perfectly new properties. Although scarcely differing in appearance from unchanged cotton, it may be distinguished from it by its harshness, by the crepitating sound which it yields when pressed by the hand, by its having lost the property of depolarization which ordinary cotton possesses, and by its electric condition. Iodine dissolved in a solution of iodide of potassium affords a certain means of distinguishing explosive from ordinary cotton. If the former is moistened with this iodine solution, and a little dilute suphuric acid is subsequently added (one part of the acid to four of water), a yellow color is evolved; while ordinary cotton wool, when similarly treated, assumes a blue color. Its most remarkable property is, however, the facility with which it takes fire, and its rapid and complete combustion. The results of gen. von Lenk's improvements in the manufacture of gun-cotton, which, however, did not lead to its superseding gunpowder in any one direction, are given below. The more recent experiments of prof. Abel, which were carried on with elaborate care for a number of years at the Woolwich arsenal, have resulted in further improving the manufacture, and also in determining more accurately the properties of gun-cotton. Abel's process consists in steeping cotton-waste in strong nitric and sulphuric acids at a low temperature, and afterwards wash-

ing it thoroughly. It is next reduced to a pulp in a common rag-engine (see PAPER), and then in the pulpy condition it is washed again in a large quantity of water to remove every trace of free acid. After that, it is pressed at a low power, and subsequently in a powerful hydraulic press, out of which it comes in so wet a state as to be uninflammable. Gun-cotton can thus be compressed into masses of any shape, as cylinders or cubes, and of any required density or hardness. It can also be converted into the form of paper, or into gun-cotton grains for sporting purposes.

Gun-cotton can now be manufactured so as to keep, there is every reason to believe, with perfect safety in a wet state, and be as good as ever when dried again. The results of some experiments carried on a year or two ago by a government committee at Chatham showed that when gun-cotton is firmly confined, it exerts a destructive effect equal to about five times that of gunpowder.

Prof. Abel has proved that the more thoroughly gun-cotton is compressed, the more perfectly can its action be controlled, and it is now generally used in compact disks for mining purposes; that it is sympathetic, so that, if gently ignited by a spark, in the form of yarn, it smolders slowly away; if by a flame, it burns up rapidly; and if fired in the compressed state by a detonating fuse, it explodes with great violence, even when unconfined. The most recent and striking discovery regarding it, however, is, that although, as a rule, non-inflammable and non-explosive in the wet state, yet, when fired in this condition with the detonating substance fulminate of mercury, and a little dry gun-cotton or gunpowder, it explodes with as much violence as when it is dry.

While gunpowder does not explode at a lower temperature than 600° F., gun-cotton has been known to do so at 277° F., and cannot be heated to 400° F. without explosion. Gun-cotton produces neither smoke nor fouling when fired, and does not heat the gun so much as gunpowder, though, by the rapidity of its explosion, it strains the barrel more.

GUN-COTTON. [*From Supplement.*] During the last few years, great improvements have been effected in the manufacture and application of this material, and in consequence, its use is rapidly extending, especially in Great Britain, where it is found of great advantage in mining operations, owing to its not producing smoke when exploded. For the improvements as well as the invention of gun-cotton, we are indebted to Germany and Austria, the most important improvement being that of baron Lenk, consisting chiefly in the following precautions in the manufacture: 1. A perfect cleansing and drying of the cotton. 2. The use of the most concentrated and purest acids procurable commercially. 3. Steeping the cotton a second time in a mixture of the strong acids. 4. Continuance of this steep for 48 hours. 5. A thorough purification of the gun-cotton from free acid by washing in a running stream for several weeks. This may be supplemented by washing in a weak solution of potash, but is not absolutely necessary. The following are the important advantages insured by the new method of making gun-cotton:

For Purposes of Artillery.—1. The same initial velocity of the projectile can be obtained by a charge of gun-cotton one-fourth of the weight of gunpowder. 2. There is no smoke from the explosion of gun-cotton. 3. Gun-cotton does not foul the gun. 4. Gun-cotton does not heat the gun to the injurious degree of gunpowder. 5. Gun-cotton gives the same velocity to the projectile with much smaller recoil of the gun. 6. Gun-cotton will produce the same initial velocity of projectile with a shorter length of barrel. 7. In projectiles of the nature of explosive shells, gun-cotton has the advantage of breaking the shell more equally into much more numerous pieces than gunpowder. 8. When gun-cotton is used in shells instead of gunpowder, a quantity equal in weight to one-third of the latter produces double the explosive force.

For Civil Engineering and Mining.—9. In driving tunnels through hard rock, a charge of gun-cotton of given *size* exerts double the explosive force of gunpowder, so as to render a smaller number of holes necessary. 10. Gun-cotton also may be so used as, in its explosion, to reduce the rock to much smaller pieces than gunpowder, and so facilitate its removal. 11. As gun-cotton produces no smoke, the work can proceed much more rapidly, and with less injury to the health of the miners. 12. In working coal-mines, the advantages of bringing down much larger quantities of material with a given charge, and the absence of smoke in the explosion, enable a much greater quantity of work to be done in a given time at a given cost. 13. The weight of gun-cotton required to produce a given effect in mining is only one-sixth part of the weight of gunpowder. 14. In blasting rock under water, the wider range and greater force of a given charge is a great element in cheapening the cost of submarine work. 15. The peculiar local action of gun-cotton, to which the effects of gunpowder show no analogy, enables the engineer to destroy and remove submarine stones and rocks without the preliminary delay and expense of boring chambers for the charge.

For Military Engineering.—16. The smaller weight of gun-cotton offers great advantages in facility of transport, the weight being one-sixth that of gunpowder. 17. The peculiar localized action of gun-cotton enables the engineer to destroy bridges and palisades, and to remove every kind of obstacle with great facility. 18. For submarine explosion, either in attack or defense, gun-cotton has the advantage of a much wider

range of destructive power than gunpowder. 19. For the same purpose, gun-cotton, from its lightness, has the advantage of keeping afloat the water-tight case in which it is contained, while the gunpowder sinks to the bottom.

For Naval Warfare.—20. Where guns are close together, as in the batteries of ships and casemated forts, the absence of smoke removes the great evil of the firing of one gun impeding the aim of the next, and thus gun-cotton facilitates rapid firing. 21. Between-decks also, the absence of smoke allows continuous rapid firing to be maintained. The absence of fouling and of heating are equally advantageous for naval as for military artillery. Of late, gun-cotton has come to be extensively used for charging torpedoes of various kinds, especially in the English, American, and German naval service.

General Advantages.—Time, damp, and exposure do not alter its qualities when carefully prepared. Being made in the form of rope, yarn, or, according to the most recent improvement, in compressed disks, accidents cannot arise from spilling, as in gunpowder. As it can be exploded in a wet condition, provided a small quantity close to the detonating apparatus be dry, gun-cotton can be stored wet, and the risk of accidents can in this way be in a great measure avoided. The dreadful explosion at the gun-cotton mills, Stowmarket, in 1871, threw doubts on the safety of this substance. However, the works at Stowmarket were rebuilt, and government manufactures this explosive in large quantities at Waltham Abbey. Gun-cotton is not now much in demand for artillery purposes, but it is more or less used for mining and quarrying in several parts of England.

GUNDULF, perhaps "a reformer before the reformation," in the 11th c. gathered disciples around him in the n. of France, particularly in Arras and Liege. He may have been an artisan who had settled in that region because of the flourishing condition of manufactures there, and among his fellow-workmen found or made disciples to his religious views. His greatest success was prior to 1025, in which year a company of his followers were arrested by Gerhard, bishop of Cambrai and Arras, and brought to trial for spreading heretical doctrines. According to the rules which they avowed they were persons who had forsaken the world, were striving to keep the flesh in subjection, to support themselves by their industry, to be honest in their dealings and to love all who were willing to join them. In their assemblies they were accustomed to pray and to wash one another's feet. But Gerhard, affirming that he had obtained from some of their proselytes a knowledge of their faith and practice, charged them with rejecting the Roman Catholic church, the pope's supremacy, the hierarchical system and even all clergy whatever; and with saying that "dogmatic, liturgic, and constitutive traditions are worthless; all the sacraments of the Roman Catholic church are to be rejected; the consecrated elements of the Lord's supper are nothing more than what they appear to our senses; at the last supper Christ did not really give his disciples his body for food and his blood for drink; marriage is to be avoided; church buildings are not holy, hence worship does not derive any special virtue from being offered therein; the altar is only a heap of stones; fumigations, and the ringing of bells are useless ceremonies; crosses, crucifixes, images tend to idolatry." But although Gerhard charged the followers of Gundulf with believing these doctrines, they would not avow them. They defended only their opinions concerning baptism, to show the inefficacy of which, as an outward rite, they pointed to the immoral lives of the clergy who administered, and of the people who received it, as well as to the fact that in the children baptized, not one of the conditions was to be found on which all efficacy must depend—no consciousness, no will, no faith, no confession. But at length, under the combined influence of the bishop's arguments and of torture, they agreed to recant their errors. Then Gerhard and other members of the synod pronounced a condemnation of the heresy, excommunicated the authors of it, if they did not repent, and compelled the prisoners to sign a statement of the true Roman Catholic doctrine before they were released. A copy of the proceedings was sent also to the bishop of Liege. The acts of the synod are the only source from which knowledge of this sect can be obtained; and after the trial neither Gundulf nor his followers can be traced. If they continued to hold their opinions they did so in secret. Similar sects existed at all times in the Roman Catholic church and, so far as the facts concerning them can be discovered, they seem generally to have been seekers after truth and godliness, in an age whose corruptions had dishonored the Christian name.

GUN FACTORIES, Royal, are government establishments at Woolwich for the construction of great guns for the use of the British army and navy. For a very long period there had been at Woolwich a small factory for the manufacture of brass cannon, but guns of cast-iron were obtained from private foundries by contract. At last it was determined that government should become in part its own gun-founder, and extensive work-shops were erected in 1855—6. The adoption of the Armstrong wrought-iron gun into general use in the service, in 1859, arrested the further making of cast-iron guns, and occasioned again a great expenditure in the erection of shops and costly machinery, which have since been adapted to the other systems of wrought-iron ordnance adopted into the service under the name of "Woolwich." The factories may now fairly be regarded as among the most remarkable sights in the kingdom. In each department, whatever the process, it is repeated over and over again, till long parallel

lines of similar mills are seen, each busily fashioning a separate gun. Iron at red-heat is first wound round a solid core (representing the bore of the future gun), as tape might be round a pencil; and then by the action of successive blows from a steam-hammer (there is one of 100 tons), the strips are welded into a compact cylinder of wrought-iron of extreme density. This cylinder, after undergoing several heatings and poundings with the steam-hammer, is encompassed with wrought-iron rings of immense strength, which are shrunk on, and then transmitted to the boring-mill. Here the proper caliber is imparted to it; in another department, the bore is rifled; in another, the outside of the gun is carefully turned; and in yet another, the whole is polished and browned. A gun is several weeks in its passage through these many processes. By the ingenuity of sir William Armstrong, the superintendent, and Dr. John Anderson, his able assistant, every part of the difficult manufacture has been reduced to a question of machinery. Many thousand guns have to this time been turned out complete, of which upwards of 7,000 are now available for military or naval use. The cost of the guns as now made is, on an average, as follows: 12-pounder, £82; 20-pounder, £124; 40-pounder, £206; 70-pounder, £375; 35-ton gun, £2,156. The royal gun-factory at Woolwich was estimated to cost for 1878—9 the sum of £203,948, of which £5,242 were for management; £78,656 for the wages of artificers and laborers; £12,671 for buildings and machinery; and £104,190 for stores to be consumed in the manufacture of guns.

Much of the machinery now used in the manufacture of guns was originally developed at the engineering and founding establishment of sir William Armstrong and Co., at Elswick, which was for some time used as an auxiliary and supplement to the gun-factory in Woolwich arsenal, the guns being turned out at a contract price, payable after they had passed a rigid inspection. The connection between the government and the Elswick firm ceased in 1863.

GUNDAMUK', a village of Afghanistan, claims notice merely in connection with the fatal retreat from Cabul in 1842. It was here that the last remnant of the British force, when within 28 m. of the shelter of Jellalabad, was massacred, to the number of 100 soldiers and 300 camp-followers, only one man effecting his escape.

GUNDUK', a river of India, joins the Ganges from the left or n. side, opposite to Patna, after a s.e. course of about 400 miles. It is supposed to rise beyond the Himalayas, in lat. 29° 40′ n., and long. 83° 14′ e., while its remotest source within that range is said to be at the foot of Dhwalagiri. After a course of 200 m. it becomes practicable for boats of considerable burden. Near this point the river touches the British territory, dividing it for 15 m. from Nepaul.

GUNDULITSCH, IWAN, the most celebrated Serbian poet of earlier times, was the son of Francis Gundulitsch the historian, and was born Aug. 8, 1588, in the town of Ragusa. After he had completed his primary education and philosophic studies under the Jesuits, he betook himself, at the age of 21, to the science of jurisprudence, in which he made such rapid advances, that in spite of his youth, he was intrusted with the first offices of the Ragusan republic. He died in 1638. On Dec. 20, 1838, the bicentenary anniversary of his death, a grand requiem was sung in memory of the poet, in the Academic church of Agram.—Gundulitsch's poetical works, lyrical, dramatic, and epical, are a faithful mirror of the stirring time in which they were composed. He was the earliest dramatic writer of the Slavic race, and the theater of Ragusa, in which his pieces were performed, was the first Slavic theater. His greatest and most celebrated work is an epic, *The Osmanli*, in 20 cantos, in which he sings the deeds of Osman II., and the fame of the Poles and their king, Wladislaw IV., in the campaign of 1621. This work was first published at Ragusa in 1626; the latest edition is that of Gaj (Agram, 1844). Of his dramas, may be mentioned *Ariadne*, *The Rape of Proserpina*, *Galatea*, *Diana*, *Armida*, *The Sacrifice of Love*, *Ceres*, *Cleopatra*, *Adonis*, and *The Coral;* of his other poems, *Hymn on the Greatness of God* and *The Tears of the Afflicted Son.* Gundulitsch also made several translations from the Italian poets.

GUNMAKING, GUN-TRADE. Although the terms gunnery and gun relate chiefly to great guns or cannon, the word gunmaking is always applied to the manufacture of small-arms, comprising muskets, rifles, pistols, and carbines. In England the great seat of this trade was formerly London, whose workmen stood unrivaled throughout Europe for the excellence of their production; but of late years the gunmakers of Birmingham have succeeded, from local advantages, in turning out barrels of proved power, at such a price as to defy competition. Since then the London makers have confined themselves to "finishing," or putting together, an art requiring the utmost nicety; and even in this, the skilled labor of Dublin and Edinburgh has now nearly equaled them. There are, therefore, several centers now in the United Kingdom whence first-rate arms are to be obtained. America and the leading continental nations are great manufacturers also, and each has its particular excellences. The chief continental gun-factories are at St. Etienne, Liege, Vienna, and Suhl.

Machinery has been comparatively slow in being applied to the manufacture of small-arms, but during the last few years it has made giant strides; and now the government manufactory at Enfield, in which numerous ingenious machines have been introduced from the United States, is fitted with every mechanical appliance, and can turn out

many thousand arms per annum, each of which so exactly corresponds to pattern, that all the constituent pieces are interchangeable. Barrels, instead of being forged by the hand-hammer, are rolled at once with a uniform pressure, and then welded at one heat. In the United States, barrels are at present made of cast-steel, first formed in the solid, and then bored by a succession of borers of increasing diameter. These cast-steel barrels are rapidly superseding all others—at least for sporting purposes—in Great Britain, France, and America. Another favorite modern material for barrels is "laminated steel." See BARREL. Barrels well constructed with laminated steel resist a bursting pressure of 82,000 lbs. on the square inch, one-eighth of an inch thick, whereas common "twist" barrels will only withstand about 34,000 lbs.

When the barrel is finished, however made, it is proved, under very heavy charges of powder. All non-government barrels made in England must be proved at the proofing houses of London or Birmingham; government arms are tested at Enfield.

The portions of the lock (q.v.) are made some of iron and some of steel, either forged by hand, or, as in the great manufactories, stamped out by a powerful machine. The stock is turned by machinery from strong light wood. On all accounts taken together, it is found that no wood is so well adapted as Italian walnut. The finishing or putting together of guns is an art in itself, the utmost attention having to be devoted to everything that will secure solidity, lightness, and the most minute accuracy of fitting. Skilled artificers in the gun-trade command excellent wages; rarely less than 40*s.*, and often as much as £4 a week.

In fitting and finishing, London is generally admitted to stand unequaled; Paris, however, making a good and near second. For barrels, Birmingham, St. Etienne, and Liège have the most repute. In all respects, Toledo, once famed for its blades, holds a high character in regard to its guns, both for sporting and military purposes. In the United States, Windsor and Hartford are the leading manufactories, with Harper's Ferry for government arms; but the quality of American workmanship is too often sacrificed to cheapness in the article turned out. The British export trade in small-arms is very great, the return for the year 1875 showing an exportation of 318,901 stand of all kinds, of the value of £655,169.

GUNNEL, *gunnellus*, or *murænoides*, a genus of fishes of the blenny (q.v.) family, of more elongated form than the true blennies. The species are pretty numerous, but only one is British, the COMMON or SPOTTED GUNNEL or BUTTERFISH (*G. vulgaris*), often to be found in tide-pools on the sea-shore; seldom more than 6 or 7 in. long, of a deep olive color, with a row of dark spots on the back, remarkable for the quantity and thickness of the mucous secretion with which it is covered. It is seldom used in Britain except for bait.

GUNNER, in the British army, is the private soldier of the corps of artillery; he receives pay at the rate of 1*s.* 2½*d.*, per diem: his uniform consists of blue with red facings, and red stripes on the trousers; and his arms consist of a carbine and sword-bayonet.

At the present time, when artillery is used with the utmost skill and science, the training a gunner must undergo, to become thoroughly efficient, is long and arduous. His eye must be sufficiently acute to estimate distances instantly and proximately; and withal, he must possess physical strength capable of sustaining the exertions necessary for the service of heavy guns and the removal of shot and ponderous artillery stores.

Master-gunners are pensioned sergeants of artillery, who are placed in charge of the stores in small towers or forts; they are divided into three classes, of which those in the first class receive 5*s.*, in the second 3*s.* 6*d.*, and in the third, 3*s.* a day. Master-gunners are now borne in the coast brigade of royal artillery, but the office has much degenerated in importance since it was first created, at least as early as the time of Henry VIII.

In the navy, the *gunner* ranks first among the warrant-officers, and next in order to the navigating sub-lieutenant in regard to taking command of a ship. His pay varies from 9*s.* a day for chief gunners to 5*s.* 6*d.* a day for gunners of the second class. His uniform consists of a blue coat, blue cap, and officer's sword. A gunner rises from before the mast by steadiness, sobriety, and intelligence. On appointment, he must satisfy examiners appointed by the admiralty that he is in all respects qualified. His duties are highly important: he has charge of all powder and artillery stores on board, and is bound to see that the guns are always fully equipped for action. In exercising with the guns, the gunner is instructor of the sailors, and, under the captain, is responsible for their efficiency. The *gunner's-mate* is assistant to the gunner, and stands second among the petty-officers. To be confirmed in his rank, he must pass an examination in gunnery on board H.M.S. *Excellent*, at Portsmouth. His pay varies from £39 10*s.* 10*d.* a year to £34 19*s.* 7*d.* *Seamen-gunners* are continuous-service sailors, who are trained in gunnery and great-gun exercise. One has the direction of each gun, with ordinary seamen under him to perform the heavy part of working it. A seaman-gunner, if in the first class, receives 4*d.* a day beyond his pay as seaman, and 2*d.* a day if in the second class.

GUNNERY. Ignorance of the laws of gravity and of other physical circumstances affecting the flight of projectiles, prevented any correct theory of gunnery being arrived

at in the earliest stages of artillery. The first author professedly treating on the flight of cannon-shot was Nicholas Tartaglia, a distinguished Italian mathematician, who, in 1537, published his work, *La Nuova Scientia*. He had no practical acquaintance with his subject, but his guesses were shrewd and often marvelously near the truth. Among other things he ascertained that no portion of the track described by a ball is a right line, and as a practical aid to artillerists, he devised the gunner's *quadrant* (q.v.). After Tartaglia, many philosophers, especially of Italy, theorized on the question, and various tables of ranges, elevations, charges, etc., had been published, all more or less fallacious, when a nearer approach to accuracy appeared in Galileo's *Dialogues on Motion*, printed in 1638. The officers who had charge of artillery in actual use were too little gifted with scientific education to deduce theory from practice; and up to the time of Robins, who wrote in 1742, but four working-gunners—Collado, Browne, Eldred, and Alderson, of whom the last three were Englishmen—have left treatises of any value on the use of their weapons.

Galileo, in his contributions to physics, had shown that cannon-shot, or any other projectiles, being affected by the downward force of gravity, would travel in the curve of a parabola, unless affected by the resistance of the air. The philosopher pointed out modes by which the disturbances caused by this resisting medium might be ascertained; but subsequent writers, with the exception of Newton and Bernouilli, till the time of Robins, chose to assume that the atmospherical resistance was but nominal, and boldly asserted that all shot described parabolas in their course. In 1742 Mr. Benjamin Robins, who must be considered the real founder of the science, published his *New Principles of Gunnery*, a work the result of long and almost exhaustive experiments. He treated of the atmospheric resistance, of the force of gunpowder, of the effects of varying length and weight in guns, and of almost everything which in any way related to the motion of projectiles, carrying the theory of gunnery nearly to perfection. As one result of his experiments, Robins established the law that common shot encountered a resistance from the air during their passage, which increased as the square of the velocity, or very nearly so; and that their courses differed widely from parabolas. By means of the ballistic pendulum (q v.) he measured the speed of balls at the very cannon's mouth. Euler, in the latter part of the 18th c., added much to the knowledge of the subject by his commentaries on the work of Robins, as did also the mathematician Hutton.

The theory of gunnery, so far as it can be deduced from the universal laws of motion, without regard to the resistance of the air, falls under the more general head of projectiles (q.v.). But except in firing bombs, which from their low velocity are not so much affected by the resistance of the air, the mere mathematical theory is of little service. All the real practical rules have been deduced from experiment. The following are a few of the more important results thus arrived at:

For a given charge and weight of projectile, there is a certain length of bore that gives the greatest velocity; the cause being, that with a less length some of the powder is discharged undecomposed, and with a greater, the combustion is finished before the ball leaves the muzzle, so that it has to contend with the friction of the gun without receiving additional impulses. Increase of length, accompanied by proportionate increase of charge, gives increased velocity; but the greater velocity is only in proportion to the cube root of the increased length.

The resistance of the air does not arise merely from the projectile having to displace its own bulk of it as it advances; for in the case of a body moving with great velocity, the air becomes condensed in front of it, while that behind is highly rarified. The displaced air behind does not return freely to fill up the vacuum, until the speed of the ball is reduced to 1400 ft. per second; the maximum profitable velocity is calculated to be 1600 ft. and that, or any higher speed, is believed to be reduced to 1400 ft. after a course of 400 ft.

The resistance offered to bodies by the air is as their surfaces, i.e., in the case of round or cylindrical shot, as the squares of the diameters; whilst the power of the bodies themselves to overcome resistance is as their weights, or as the cubes of their diameters. Of course balls of like size but different density will produce widely different results. Hence the greater range of solid as compared to hollow shot. Solid shot fired with equal velocities and elevations, range as their weight, the heavier overcoming atmospheric resistance better than the lighter. Shot of equal weight and diameter will range according to their velocities; but not in direct proportion, for the retarding power varies as the square of the velocity. Velocities of shot of equal diameter are as the square roots of the charges.

The diminution in speed caused by atmospheric resistance may be judged of from the following table of the speed of a 32-pounder at different parts of its course; it being premised that a body in vacuo, once started, should move *ad infinitum*, without decrease of velocity:

Initial velocity				.....	1600	feet	per second.
Velocity	500	yards	from gun	.....	1126	"	"
"	1000	"	"	.....	1000	"	"
"	1500	"	"	.....	608	"	"
"	2000	"	"	.....	465	"	"
"	2500	"	"	.....	367	"	"

Action and reaction being always equal and in opposite directions, the explosion of the gunpowder acts with equal force upon the ball and upon the cannon from which it is discharged, the former demonstrating this in its range, and the latter by its recoil. This recoil has to be guarded against as much as possible, either by the weight of the gun itself, or by its secure attachment to a ponderous carriage. The momentum of the recoil, being the product of the shot's weight, and the velocity, is readily calculated. The common charge of a 24-pounder gun, being one-third the weight of the shot, or 8 lbs., the momentum of both shot and gun, will be 1600 (the initial velocity) × 24 = 38,400, which, divided by 5,600, or the gun's weight in pounds, gives about 7 ft. as the velocity per second; if the gun is attached to a carriage, the weight of the carriage must be added to that of the gun for a divisor.

The following table exhibits the effects of varying charge and elevation on different kinds of guns. The line of sight of a gun is an imaginary line drawn through the back-sight on the breech and the fore-sight, a notch in the muzzle ring, or on the first re-inforce. The fore-sight is immovable, but the back-sight is so constructed that the notch shall be at a greater or less height above the axis of the gun. When the line of sight is parallel to the axis and horizontal, the discharge is "point-blank;" but when the back-sight is raised, the direction of the axis of the gun will be to a point more elevated than that to which the line of sight is directed. Consequently, by raising the back-sight, a greater elevation, and, ordinarily, a greater range, is given to the piece. In regard to point-blank discharge, Tartaglia established the fundamental proposition that the time occupied by the ball in describing the whole trajectory or path is the same as it would require to fall by gravity from the muzzle to the ground.

Nature.	Elevation.	Charge.	Range in Yards.
12-pounder iron gun	Point-blank,	4 lbs.	300
	1 degree,	"	700
	3 degrees,	"	1200

As regards penetration, it was found by experiments against a martello tower at Eastbourne, with a range of 1832 yards, that solid shot from the 40-pounder Armstrong penetrated into good masonry from 47 to 65 in., and from an 80-pounder Armstrong 51 to 90 inches. For other particulars relative to the art of gunnery, the reader is referred to LOADING, PROJECTILES, WINDAGE, etc. The important point of the rotation of a ball or bolt will be considered under RIFLED FIRE-ARMS.

GUNNY BAGS are bags made of a coarse kind of cloth or sacking, manufactured in India, and chiefly in Bengal, from which they are largely exported to other parts of the world. The fiber of which the cloth is made is chiefly that of the same species of *corchorus*, which yield the jute (q.v.) of commerce. The cotton of America is mostly packed in gunny bags, of which the number exported to America from Bengal has increased from thousands in the year 1796 to millions in 1874. Great quantities are also exported to China, Australia, and other countries. They are partly made up into bags in Bengal, partly exported as gunny *cluts* or *chuttees*, pieces of size suitable for being immediately made into bags. The manufacture of these is the great domestic industry of all the populous eastern districts of lower Bengal. It pervades all classes, and gives occupation to men, women, and children. Boatmen employ themselves in it in their spare moments, husbandmen, palanquin-carriers, and domestic servants, being Hindus, for Mohammedans spin cotton only. It "forms the never-failing resource of

that most humble, patient, and despised of created beings, the Hindu widow, saved by law from the pile, but condemned by opinion and custom for the remainder of her days, literally to sackcloth and ashes, and the lowest domestic drudgery in the very household where once, perhaps, her will was law" (Royle's *Fibrous Plants of India*). Hence the very low prices at which gunny bags are sold. There are few articles of commerce so widely diffused over the globe as the Indian gunny bag.

GUNPOWDER, a well-known explosive mixture composed of sulphur, niter, and charcoal. Of use in several trades, its principal employment is in the discharge, for war or sport, of projectiles from fire-arms, and in the processes of blasting during mining or quarrying. The history of gunpowder has been already given under fire-arms (q.v.), and it will therefore be only necessary now to consider the chemical action which takes place when powder is ignited, and then to proceed to a short description of the manufacture.

Extreme care is requisite in securing the purity of the ingredients entering into the composition of gunpowder. The principal impurity of niter or saltpeter is chloride of sodium, or common salt, which, in consequence of its tendency to absorb moisture from the atmosphere, would have a very injurious action on gunpowder by weakening its power. The details of the process of purification of the niter would be out of place in this article. The sulphur may be purified either by fusion (when the heavier impurities sink, and the lighter ones may be removed by skimming) or by distillation. The preparation of the charcoal is a most important point. It should be light and porous, should yield a very small amount of ash, especially of carbonate of potash and other deliquescent salts, and should contain little moisture. The woods yielding the best charcoal for gunpowder are black alder, poplar, spindle-tree, willow, and dogwood, the last named giving off the largest volume of gas when ignited with a given weight of niter, and being on that account especially used for rifle powder.

A vast number of experiments have been made at different times, and by different nations, to discover the proportions of niter, sulphur, and charcoal best adapted for the production of different kinds of gunpowder; and upon the whole there has been great uniformity in the results, as may be seen from the following table of the percentage composition of the powder of different nations:

Kind of Powder.	Charcoal.	Sulphur.	Niter.	Authority.
Austrian war powder.....	13.1	11.3	75.6	Linck.
English (Waltham Abbey) war powder.....	13.7	10.1	76.2	Ure.
Russian war powder.....	17.7	11.7	70.6	Meyer.
Italian sporting powder.....	18.2	8.6	73.2	Prechtl.
Chinese gunpowder.....	23.1	15.4	61.5	Prechtl.

The chemical processes which occur in the ignition of gunpowder are commonly described as follows: When the powder is ignited, the oxygen of the niter combines with the charcoal or carbon to form carbonic acid, the potassium combines with the sulphur to form sulphide (or sulphuret) of potassium, and the nitrogen is liberated; the reaction being shown in the equation $KO,NO_5 + S + 3C = 3CO_2 + N + KS$. Powder consisting of one equivalent each of niter and sulphur, and three equivalents of carbon, would contain 74.8 per cent of niter, 11.9 per cent of sulphur, and 13.3 per cent of carbon or charcoal, which approximates very closely to the Austrian powder in the above table. It is easily shown that one volume of such powder would yield 296 volumes of mixed carbonic acid and nitrogen gases, after the ordinary reduction for temperature and pressure, although from the intense heat developed at the moment of explosion the actual dilatation amounts to at least 1500 times the volume of the powder employed. The only solid residue, supposing the above equation to represent the true reaction, is sulphide of potassium (KS), and part of this is volatilized by the heat of the explosion, causing a whitish smoke by its combustion, while the part that is not burned gives the peculiar odor to the washings of the gun-barrel.

If a larger proportion of charcoal is added, more or less carbonic oxide gas is generated as a product of combustion. Blasting powder is so composed that, theoretically, it should yield on explosion a mixture of carbonic oxide and carbonic acid gases, and leave a residue of bisulphide of potassium; the reaction being expressed by the equation $KO,NO_5 + 2S + 4C = 2CO + 2CO_2 + N + KS_2$. A powder composed according to this formula would contain 64.4 per cent of niter, 20.4 per cent of sulphur, and 15.2 per cent of carbon; and the proportions actually employed are 65, 20, and 15, respectively.

Recent investigations of Bunsen and Schischkoff (Poggendorff's *Annalen*, Bd. 102, p. 321) show that in reality the chemical reactions are very far from being as simple as those given in the preceding paragraphs; the solid residue consisting of various compounds of potassium (sulphate of potash being in greatest quantity), with portions of niter and carbon.

The ignition of gunpowder must be distinguished from its combustion. The pow-

der is ignited when a portion of it begins to develop light and heat; this in granulated gunpowder communicates from grain to grain with the utmost rapidity; but still, it is important to bear in mind, by successive ignitions. Combustion means the final and total decomposition of each grain separately, and the complete liberation of its component gases. In gunpowder these phenomena follow each other so rapidly, that, unless the mass is spread over a considerable space, they *appear* simultaneous. The heat spread around by each grain during its combustion suffices to ignite all other grains within a sphere of six times its own diameter. This serves to account for the almost instantaneous communication of the flame throughout the whole quantity exposed. The granulation of gunpowder has a great influence on the rapidity of its ignition; the larger the grain, the more rapid is the ignition, but the slower the combustion. On the other hand, small-grained powder ignites more slowly, and burns with greater speed. When mealed or finely powdered gunpowder is employed, it readily inflames, from the presence of the ordinary ingredients; but there being no interstices, the conflagration spreads but slowly, and therefore the decomposition is proportionately retarded. It thus happens that mealed powder exhibits less explosive power and less rapidity of combustion the closer it is pressed together, a circumstance taken into account in the manufacture of fireworks.

In rifled guns and muskets, where it is desired that the projectile should expand to the shape of the grooves, it is obviously best to have a powder which, by very rapid ignition, creates the utmost sudden expansion, and which, by continued combustion, maintains an increasing degree of heat, which shall further augment the explosive force of the gasses evolved up to the period of time at which the projectile is driven from the muzzle of the weapon. With this object, large-grained powder is clearly the most suitable, although a contrary view has been long accepted; and that to so great an extent, that some among the recent inventors of rifled arms have had to complain that the only gunpowder they could obtain has been far *too good* for their purposes.

Process of Manufacture.—The three ingredients being taken to separate mills, are reduced by successive grindings to impalpable powder. The several materials are then taken to the *mixing-house*, where they are weighed out into their respective proportions. The charcoal is spread in a trough, and the sulphur and niter being sifted upon it, the whole are incorporated, though imperfectly, by the hands. The next process is in the *powder-mill*, where the mixture is ground between millstones, and thoroughly incorporated in a wet state. So dangerous is this part of the manufacture, that makers are forbidden to grind more than 42 lbs. in the same house at one time: all the bearings of the machinery are of copper, lest heat should be generated by the friction. According to the quality intended is the time during which this trituration is continued, from one hour to six being that usually employed, and three hours the period in the government factory. The powder, completely pulverized and caked by the moisture and the pressure, leaves the mill in small lumps, called *mill-cake*. This mill-cake is then spread between copper-plates in layers about 3 in. thick, and is subjected to an immense pressure either by a screw-capstan or by a hydraulic engine.

The next operation is graining, a process to which, as already explained, gunpowder owes its rapidity of ignition, and its consequent explosive power. This is performed by forcing the mill-cake through minute holes in a circular parchment sieve, the sieve being kept by mechanism in rapid revolution. The grains thus formed are, however, of very various sizes; and that the gunpowder should be homogeneous, it is necessary that they should be sorted into the several sizes. This is done by the intervention of a series of sieves of different degrees of fineness.

Since the introduction of the immense modern cannon, it has been found necessary to make powder with very large grain, even larger than hazel nuts, this is called *pebble powder*, and is now in general use.

The last processes are drying, glazing, and freeing from dust. The first is effected by heating the powder to a point sufficient to drive off moisture; the second, by the friction of the grains together in a revolving cylinder; the third, by the centrifugal action caused by the powder being twisted round at great speed in a gauze cylinder, when the dust (formed in the polishing) flies off through the gauze, and the bright grains remain as finished gunpowder.

This is the modern system—a system involving considerable personal risk at every stage; for the fine dust becomes so diffused through the atmosphere in the mills that the slightest spark would blow the whole into the air in a moment. The early process of manufacture was, however, even more dangerous. What with the stirring, and pounding, and spirit (which our forefathers used instead of water, in the idea that a strong fluid would impart strength to the mixture), it was probably to the impurity alone of the materials that the operators were indebted for not being blown to pieces.

The following are the chief properties of gunpowder. Good powder should be perfectly uniform in texture, and should not present any light specks or glittering points. The grains should be sufficiently hard not to be easily crushed by the fingers, or to soil them, or a piece of paper, by mere contact. If inflamed on white paper, it should blacken it but slightly, should on no account set fire to it, and should leave only a very slight residue. The temperature at which it explodes has been carefully studied by Violette, who obtained the following results:

	Angular grains.	Pulverized.
1. Blasting powder explodes at.....	518°	509°
2. War powder explodes at.....	528°.5	510°.5
3. Sporting powder, fine, explodes at.....	536°	514°.8
4. Sporting powder, extra fine, explodes at.....	603°	518°

The most combustible of these powders was the one containing the largest amount of sulphur, which is the ingredient most ready to enter into ignition. When gunpowder is exposed to a heat of 500°, the whole of its moisture is expelled, and the niter and sulphur are reduced to the fluid form. On cooling, such powder is found to be intensely black, and the grain has become indurated, and is no longer able to imbibe moisture. Powder is inflamed by any burning substance, by red-hot metal, by the electric spark, or by the violent concussion even of comparatively soft bodies, if it be sufficiently powerful. For example, powder placed upon lead, or even on wood, may be ignited by the shock of a leaden bullet fired at it. Its specific gravity is about 1.8.

The nature of the residue which is left after the ignition of the powder has been already explained. The *fouling* caused by this residue is avoided to some extent by the lubrication of the barrel with a little fatty matter.

The manufacture of gunpowder is carried on to a great extent in Great Britain; the exports in 1875 were 15,071,979 lbs., shipped principally to the colonies, and to western Africa and South America.

GUNPOWDER, Laws Relating to. In order to guard against the frightful consequences to the public likely to arise from carelessness in the preparation, preservation, or conveyance of this most dangerous article, the legislature in 1875 made stringent rules upon the subject. By 38 and 39 Vict. c. 17—an act which applies also to Scotland and Ireland—it is provided that no gunpowder shall be manufactured except at a factory lawfully existing or licensed under the act, and it shall not be kept except in the factory where it is made, or in a magazine or store duly licensed, or in registered premises. The license is obtained from the local authority (usually justices), and approved by the home secretary. General rules are imposed for regulating factories and magazines. There must be a lightning-conductor. No charcoal or oiled rags must be taken into the building except for immediate use. No smoking is allowed. Tools are to be made of wood or soft material. Workingmen's clothes are to be without pockets. Carriages and boats for conveying gunpowder must have in their interior no iron or steel exposed. Each building is to have affixed, so as to be easily read, the quantity of gunpowder allowed in each. Retail dealers must be registered, and must keep their powder in a separate house or in a fire-proof safe, not exceeding 200 lbs.; but if kept inside the dwelling-house 50 lbs., or if in a safe inside, 100 lbs. The building or safe is to have no exposed iron or steel in the interior. A breach of precautions against fire or explosion is visited with heavy penalties. The local authorities must keep registers of licensed persons, and all ratepayers can demand a copy thereof. Retail dealers, if using less than 5 lbs. for cartridges at a time, are exempted from taking out a factory license. No powder must be sold to a child under 13. All powder exceeding 1 lb. weight must be sold in a canister or case securely fitted, and with the word "gunpowder" visible. Also, powder must be closely and securely packed and labeled for conveyance, if exceeding 5 lbs., and the amount carried is not to exceed 100 lbs. All railway and canal companies are to make rules and have special times and places for loading and unloading powder. Firework factories, if making and keeping less than 500 lbs. of fireworks, need only a license from the local authority; but exceeding that quantity, one from the home secretary. To let off a firework in a street or highway subjects the offender to £5 penalty. A government inspector may at any hour of day or night enter and inspect any factory, magazine, or registered premises, and may require the occupier, under a heavy penalty, to make alterations, or take certain precautions. Search-warrants are also readily granted, and in urgent cases are dispensed with.

GUNPOWDER FACTORY, Royal, at Waltham abbey, an establishment in which much of the gunpowder required for the British army and navy is made. It is built on all the newest and most approved principles to insure safety, economy, and efficiency; but even here accidents occasionally happen in this dangerous manufacture, and roofs and sides, purposely left loose so as to offer but little resistance, are scattered to the winds. Between the different mills mud-banks are raised, and groves of trees thickly planted, to lessen the concussion, and, as far as possible, limit the catastrophe when one house is unfortunately exploded. A series of raised canals, at the same time, is ready to flood the whole place, or to afford a precarious shelter to the men employed, if time be available to make use of it. The charge for this factory for 1878–79 was £104,439, of which £20,692 were for management and wages, £19,696 for buildings, and £44,764 for raw material. There are about 200 workmen. When the gunpowder is made, it is sent down the Lea navigation, to the magazines at Woolwich and Purfleet.

GUNPOWDER PLOT, The, was a fanatical project on the part of a few Roman Catholics to destroy the king, lords, and commons on the meeting of parliament on Nov. 5, 1605. James I. had succeeded Elizabeth two years before, and his government had

exercised great severities against the Roman Catholics, not merely denying them religious toleration, but confiscating their property. A few ruined and exasperated men banded together to overthrow the government. The originator of the plot was Robert Catesby, a man of fortune, which he had impaired by youthful extravagance, and who communicated his idea to Thomas Winter, who was horrified at first, but after a time began to approve and further it. For this end he enlisted into the conspiracy Guy Fawkes, a soldier of fortune, of considerable military experience, and a most determined and fearless character. Catesby enlisted other two, by name Wright and Percy —the latter a relation of the earl of Northumberland. They hired a house and garden contiguous to the parliament house, and commenced their mine, part working when the others slept, and the rubbish being buried during night. One day they were alarmed by a noise after they had with much labor pierced the wall three yards thick. Fawkes learned that this noise proceeded from a cellar under the house of lords, which would soon be vacant. He hired it, and barrels of gunpowder were placed in it, and stones and billets of wood placed over them, for the double purpose of concealment and to act as destructive missiles when the gunpowder was fired. In the interval, a brother of Wright and a brother of Winter had been added to the conspirators, so they were now seven. But they wanted money; and to supply it, two others were induced to enter this fanatical copartnery, and these were sir Everard Digby of Gatehurst, in Buckinghamshire, a young gentleman of large estates; and Francis Tresham, a follower of Essex, like Catesby and Percy, but, unlike them, a selfish unenthusiastic man—not a man at all suitable for conspiracy, except that he had £2,000 to contribute. Their plan was finally arranged for the reassembling of parliament, which was to take place on Nov. 5. Guy Fawkes was to fire the mine (if the gunpowder in the cellar may be so called), and then flee to Flanders by a ship provided with Tresham's money, and waiting ready on the Thames. All the Roman Catholic peers and others whom it was expedient to preserve were to be prevented from going to the parliament house by some pretended message or other, on the morning of the day. After all was ready, lord Mounteagle was at supper at his country-house at Hoxton, where he very seldom was. As he sat, a page handed him a letter received from a stranger, advising him "to devise some excuse to shift off your attendance at this parliament, for God and man hath concurred to punish the wickedness of this time." That this letter was written by or for Tresham, who was lord Mounteagle's brother-in-law, there can be little doubt. That he desired to save him was certainly one reason for writing it; that he desired to save the conspirators, or at least to allow them to escape, is very probable; and that they might have escaped, but for the fanatical hopes of Catesby, is all but certain. It is also probable that lord Mounteagle had been fully informed of the whole matter by Tresham, and that the supper in the country and the letter were mere devices to conceal Tresham's treachery. When the letter was formally communicated to the king, he at once declared its meaning, and the most simple way of accounting for his power of divination is to suppose that, like lord Mounteagle, he had been told beforehand. On the very evening of the 4th, the lord chamberlain and lord Mounteagle visited the parliament house, and entering the cellar in a casual way, told Guy Fawkes, whom they found there, and who passed as Percy's servant, that his master had laid in plenty of fuel. Only fanaticism gone the length of fatuity could have made him persevere after this. But he did, though escape was still possible; and on the morning of the 5th, a little after midnight, he was arrested coming out of the cellar, dressed as for a journey. Three matches were found on him, a dark-lantern burning in a corner within, and a hogshead and 36 barrels of gunpowder. He was examined and tortured. He confessed his own guilt, but would not discover his associates. However, he and the chief of them were either killed on being captured, or died on the scaffold; except Tresham, who at first walked about openly, but at last was apprehended, and died of a natural disease in the Tower. The memory of this plot, invested by much fiction, has survived in England; and it was not more diabolical than hopeless and mad. It was in itself mysterious, and for purposes of state policy and Protestant zeal, a further mystery was thrown over it. No name in English history has been more detested than that of Guy Fawkes (q.v.).

GUNROOM, in British line-of-battle ships, is the common cabin of officers below the rank of lieutenant (with the exception of the assistant-surgeon, who sits in the wardroom). In frigates and smaller vessels, the gunroom is the common cabin of the lieutenants, master, surgeon, assistant-surgeon, paymaster, marine officers, chaplain, and chief engineer; the junior officers being in those cases consigned to the cockpit.

GÜNS (Magyar, *Köszegh*), a small t. of Hungary, situated on a river of the same name, about 57 m. s.s.e. of Vienna. It is inhabited almost wholly by Germans, who are the descendants of Bavaro-Frankish colonists that settled here in the 9th c., and who speak a dialect differing from any other German dialect. Fruit and wine are largely cultivated. Pop. '69, 6,915. Güns made itself for ever famous by its noble defense for 28 days against the Turkish army under Solyman in 1542. This defense not only forced the Turks to retire, but afforded time for the emperor Charles V. to assemble a force strong enough to oppose them.

GUNSHOT WOUNDS may vary in severity from a simple bruise to the tearing away of a whole limb. Single balls produce a cut, bruised or lacerated wound, according to

the amount of their velocity when they strike the body. The effects of small shot vary with the distance and power of the gun; when close, the charge enters with the pellets so close together as to make one wound like a single ball. Some years ago, it was commonly believed that the "wind of a large shot" could produce serious injuries: this belief may have arisen from the circumstance that when a heavy ball, which has lost some of its force, strikes the body at a particular angle, the skin does not always give way, but the deeper structures, such as the muscles, or large organs, as the liver, may be completely crushed. If the wind of a shot could kill a man, it is not likely that soldiers should have had ears, noses, and lips shot off, and yet have experienced only the symptoms produced by those slight injuries.

When a bullet passes out of the body, there are two openings—that of "entrance," which is generally depressed, round, regular, and smaller than that of "exit." The modern conical ball makes a well-defined oblong wound, but it may shift its direction. so as to strike longitudinally, and cause a more extensive injury to the skin. When a bullet strikes the shaft of a bone, it cracks or splinters it, and either remains or passes through the cancellated ends. In its course, the ball may carry before it pieces of cloth, coins, or other foreign bodies, which increase the danger of the wound. Many persons who have been shot during the excitement of battle, describe the sensation as resembling the sharp stroke of a cane; but in most instances the wounded man soon begins to tremble, as if in an ague-fit, complains of cold, his face becomes pale, his pulse scarcely perceptible, and he appears as if about to die. This is the condition termed *shock;* and though death sometimes does ensue during this state of prostration, it is not so serious as it appears, and the patient will probably pass out of it in a few hours with the help of stimulants and rest. Although excessive bleeding is not so common after gunshot as other kinds of wounds, it may occur immediately to a fatal extent, if assistance be not afforded. This assistance any one can give; it consists simply in placing the fingers in the wound, and if the vessel can be reached, pressing them upon it, directed to the proper point by the warm gush of blood. Should the wound be too small to admit the finger, a handkerchief may be tied round the limb above the wound, and twisted tightly with a stick. It is well to examine the wound, to ascertain the extent of the injury done, and whether there are splinters of bone or portions of dress lying in it, which should be removed. But neither the examination nor the removal should be attempted if they seem likely to aggravate the injury. The treatment is similar to that of other wounds, and consists in protecting the part during the healing stages, moderating inflammation by cold-water dressings or soothing poultices, and hastening the last stages of cure by stimulating lotions. During his illness, the general treatment of the wounded man must depend upon so many different circumstances, that it would be out of place to enter upon them here.

GUNTER, EDMUMD, an English mathematician, was b. in Hertfordshire, in the end of 1580 or the beginning of 1581. He was educated at Westminster school, and afterwards at Christchurch college, Oxford. While at Oxford, he gave his attention principally to the study of mathematics, and in 1606 invented the sector, with the lines known as Gunter's Scale. Subsequently, he took orders, became a preacher, and took the degree of B.D. But the bent of his mind being strongly towards mathematical studies, he obtained the professorship of astronomy in Gresham college on Mar. 6, 1619. He died Dec. 10, 1626. The principal works of Gunter are the two following: *Canon Triangulorum* (Lond. 1620), a table of logarithmic sines, etc., to seven places of decimals, being the first table published in accordance with Briggs's system; in this work, we find for the first time the words "*co*sine," "*co*tangent," etc.; *Of the Sector, Cross-staff, and other Instruments* (1624). We also owe to Gunter the invention of the surveying-chain (see next article), and the first observation of the variation of the compass.

GUNTER'S CHAIN—GUNTER'S SCALE. *Gunter's chain,* so named after its inventor, is that commonly used by surveyors in measuring land. It is 66 ft. long, and its convenience in practice turns on the fact, that ten square chains make one acre. The chain is divided into 100 links, and thus 100,000 square links make an acre.

The name of *Gunter's Scale* or *Gunter's Lines,* is usually given to three lines to be seen on almost any sector, and marked N, S, T, meaning the lines of logarithmic *numbers,* of logarithmic *sines,* and of logarithmic *tangents.* To understand their construction and use requires a knowledge of logarithms; they are explained in every school-book of practical mathematics. The distances of the divisions marked 1, 2, 3, etc. on the line of log. numbers, represent the logarithms of those numbers—viz., 0, .301, .477, etc.,—taken from a scale of equal parts. The other lines are constructed on an analogous plan. Calling to mind that multiplication of numbers is effected by the addition of the logarithms, division by their subtraction, involution by their multiplication, and evolution by their division, we are able to perceive with what ease many *rough* problems in areas, heights, cubic contents, and other matters may be performed through the agency of Gunter's scale.

GUNTUR, or GUNTOOR, one of the districts in Hindustan on the w. side of the bay of Bengal, called the northern circars. It is between 15° and 17° n. and s. of the

river Kistnah, which separates it from Masulipatam. It is the most southerly of the northern circars, and comprehends an area of about 3,500 sq.m.; exclusively of the mountainous district of the west. This district was the jaghire of Bassalut Jung, the brother of the nizam, when lord Clive obtained, in 1765, the northern circars from the Mogul, on which account he was allowed to retain it during his life; but after this it was to devolve to the company. It is a low, flat country, better calculated for growing rice than the more valuable grains. Its principal seaport is Mootapilly; and its chief town is Guntoor, the population of which is estimated at 20,000. The Guntoor territory now forms one of the districts under the Madras presidency, into which the northern circars were divided when the present Madras judicial and revenue system was established. Guntoor is the capital.

GUNTUR', a t. in the presidency of Madras, stands about 18 m. to the s. of the Kistna or Krishna, and about 30 to the w. of the bay of Bengal, in lat. 16° 20′ n., and long. 80° 30′ east. It contains about 20,000 inhabitants; and though badly built and much overcrowded, it is yet understood to be a healthy place. The district of Guntur is now merged in the collectorate of Kistna or Krishna.

GUNWALE, a term used on shipboard, rather vaguely, to designate the upper portion of the side of a ship or boat.

GURDÁSPUR, a British district in the Punjab, India, 1822 sq.m.; pop. '68, 906,126. The district occupies the submontane portion of the Bári Dóab, or tract between the Bias and the Ravi. An intrusive spur of the British dominions runs northward into the lower Himalayan ranges to include the mountain sanatarium of Dalhousie. This station crowns the most westerly shoulder of a magnificent snowy range, the Dháola Dhár, between which and the plain two minor ranges intervene. Below the hills stretches a picturesque and undulating plateau covered with abundant timber, made green by a copious rainfall, and watered by the streams of the Bári Doáb, which, diverted by dams and embankments, now empty their waters into the Bias directly, in order that their channels may not interfere with the Bári Doáb canal. The district contains several large and important *jhils* or swampy lakes. Few facts can now be recovered with regard to the early annals of Gurdáspur. Our first distinct historical knowledge began with the rise of the Sikh confederacy. The whole of the Punjab was then distributed to the chiefs who triumphed over the imperial governors. In the course of a few years, however, the famous Ranjít Sinh acquired all the territory which those chiefs had held. Pathánkot and the neighboring villages in the plain, together with the whole hill portion of the district, formed part of the area ceded by the Sikhs to the East India company after the first Sikh war in 1846. In 1861–62, after receiving one or two additions, the district was brought into present shape, having its head-quarters at Gurdáspur.

GURGAON', a district of the Punjab, in the commissionership of Delhi, stretches in n. lat. from 27° 40′ to 28° 30′, and in e. long. from 76° 21′ to 77° 35′, containing 2,016 sq.m., and (1868) 696,646 inhabitants. Its chief t., which bears the same name, stands at the height of 817 ft. above the sea. Its monthly temperature ranges between 66° F., the average of Dec., and 104°, the average of May.

GURGES, or GORGES, a charge in heraldry, meant to represent a whirlpool. It takes up the whole field, and when borne proper, is azure and argent.

GURGI'NA BALSAM, a name of the balsamic liquid, also called WOOD OIL, obtained from the gurjun tree (*dipterocarpus turbinatus*). DIPTERACEÆ and WOOD OIL.

GURHWA'L, a district in the n.w. provinces, lies between the Dehra-Doon and s.w. Thibet, extending in n. lat. from 30° 2′ to 31° 20′, and in e. long. from 77° 55′ to 79° 20′. It contains 5,500 sq.m., and (1871) 310,282 inhabitants. Being on the southern slope of the Himalaya, Gurhwal is little more than a mass of stupendous mountains, whose elevation above the sea sometimes reaches 23,000 feet. It may be regarded as the cradle of both the Jumna and the Ganges, attracting, in spite of the length and ruggedness of the way, crowds of pilgrims to the peculiarly sacred localities of Jumnotri, Devaprayaga, and Gangotri.

GURIEV, a t. and fortress in Russia on the Ural river, near its mouth, 188 m. n. of Astrakhan; pop. 2,838. The people are chiefly Cossacks, who have considerable business in manufactures and trade.

GURK'FELD, a t. of Carniola, Austrian empire, on the right bank of the Save, 46 m. e. by s. from Laibach, at the base of a mountain-range. It is supposed to occupy the site of the Roman Noviodunum. The district produces much wine. There are thermal springs and baths in the town. It contains a Capuchin monastery. Pop. '69, 6,000.

GURLEY, RALPH RANDOLPH, 1797–1872; b. Conn.; graduated at Yale, and became a preacher in Washington, under the Baltimore presbytery. He was for half a century agent for the American colonization society, visiting Africa three times in the interest of

the colored people, and aiding in establishing the republic of Liberia. He made a great number of addresses and wrote many reports on the subjects of emancipation and colonization.

GURMUKTESWAR', a t. of British India, in the district of Meerut, on the route from the town of Meerut to Moradabad, and 31 m. s.e. of the former. It is situated on the right bank of the Ganges, about 4 m. below the reunion of the Burha Ganga, or old course of the Ganges, with the present main channel, which, a mile and a half above the town, is crossed by a much-frequented ferry, on which 15 boats constantly ply. Gurmukteswar may be regarded as the port of Meerut and the adjoining district of the Doab. Pop. '71, 7,962.

GUR'NARD, *Trigla*, a genus of acanthopterous marine fishes of the family *sclerogenidæ*, containing a considerable number of species, some of which are common on the British coasts. The head in the gurnards is angular, and wholly covered with bony plates; the body is elongated, nearly round, and tapering; there are two dorsal fins; the pectoral fins are large; the teeth are small and numerous. Many of the gurnards are distinguished by beauty of color. They are supposed to have received the name of gurnard from the sound which they sometimes emit, particularly when newly taken out of the water, and which has obtained for one or two species the local name of *piper*. A recent observer, M. Dufossé, ascribes the sound to the vibration of muscles connected with the air-bladder, and has assigned to the notes produced by different species of gurnards their particular places in the musical scale. Most of the gurnards live generally near the bottom, and are caught either by the trawl-net or by hook and line, a shining piece of a sand-eel being a very captivating bait. Although not among the finest of fishes, they are good for the table. One of the most common British species is the RED GURNARD (*T. cuculus* or *T. pini*); seldom more than 15 or 16 in. long; of a rose-red color, the body marked on the upper part with fine transverse lateral ridges; another, larger and more valuable being sometimes 2 ft. long, is the SAPPHIRINE GURNARD (*T. hirundo*), remarkable for the large size of its pectorals and the blue of their inner surface; and perhaps the most common of all is the GRAY GURNARD (*T. gurnardus*), generally of a gray color, more or less clouded or spotted with brown, black, and yellowish-white. There are several other British species; those of the Mediterranean are more numerous. Gurnards are found also in the seas of the southern hemisphere.

GURNEY, ELIZABETH. See FRY, ELIZABETH, *ante*.

GURNEY, Sir GOLDSWORTHY, 1793–1875; b. England, and known as an inventor. Among his discoveries and improvements are the magnesium, lime, and Bude lights. He claimed to have invented the oxyhydrogen blow-pipe, and the earliest to produce those movements of the magnetic needle which led to the invention of the telegraph. He also first produced the high pressure steam jet.

GURNEY, JOSEPH, JOHN, a philanthropic Quaker, b. at Earlham Hall, near Norwich Aug. 2, 1788, was educated privately at Oxford, and in 1818 became a minister of the society of Friends. His life was devoted to the prosecution of benevolent enterprises. He died Jan. 4, 1847. Gurney wrote a great number of works; among others—*Notes on Prison Discipline* (Lond., 1819); *Observations on the Religious Peculiarities of the Society of Friends* (1824); *A Winter in the West Indies described in Familiar Letters to Henry Clay of Kentucky* (1840).

GUROWSKI, ADAM, Count de, 1805–66; b. Poland. He was expatriated in 1818, and again the next year for revolutionary actions, but returned in 1825, and had a share in the insurrection of 1830. When that was over he went to Paris, joined the Polish committee, and was busy in political excitements. In 1835 he published *La vérité sur la Russie*, a work advocating Panslavism which was so favorably thought of in Russia that he was recalled, though his confiscated estate was not restored. He was in the civil service of the empire, but left the country in consequence of a quarrel in 1844; passed some time in Switzerland, Germany, and Italy, and in 1849 came to the United States. He was for several years engaged in active literary work, and wrote occasionally for the *New York Tribune*. In 1861 he was employed in the state department at Washington. Besides his works written abroad he published in the United States, *Russia as it is; The Turkish Question; A Year of the War; America and Europe; Slavery in History*, and a diary of notes on the war of the rebellion.

GUSSET, a piece at first of chain, and afterwards of plate armor, intended as a protection to the vulnerable point where the defenses of the arm and breast left a gap.—In heraldry, the gusset is enumerated as one of the abatements or marks of disgrace for unknightly conduct. It is represented by a straight line extending diagonally from the dexter or sinister chief point one-third across the shield, and then descending perpendicularly to the base. Heralds tell us that a gusset dexter indicated adultery; a gusset sinister, drunkenness; and when both were borne it was because the bearer was faulty in both respects. Cowardice was indicated by an abatement called the gore sinister (see

GORE), which, though somewhat similar, we are told carefully to distinguish from the gusset, and which consists of two arched lines drawn, one from the sinister chief, the other from the middle base of the escutcheon, meeting in the fess point. A gore like a gusset represents a detached part of a garment; and according to Guillim, gores and gussets "are things in use among women, especially seamsters, and therefore are fit notes of cowards and womanish dispositions."

GUSTA'VIA, the chief t. of the French (till 1878, Swedish) island of St. Bartholomew in the West Indies, stands on its s.w. coast, has a good harbor, and has a population of about 1000.

GUSTAVUS I., king of Sweden—known in history as GUSTAVUS VASA, but designated before his accession to power, by himself and others, GUSTAVUS ERICSSON—was b. at Lindholm, in Sweden, on May 12, 1496, and d. in 1560. As the descendant of an ancient Swedish family, which had given members to the national diet for nearly 200 years, and which had been distinguished for hatred of and opposition to Danish supremacy, Gustavus was involved at an early age in the unfortunate quarrels and domestic wars which distracted Sweden at that period, and the first achievement of the future king was to take an active part in the defense made against Christian II. of Denmark, who, in 1517, in person commanded an assault upon Stockholm, the object of which was to compel the Swedish administrator, Svante Sture, and his senate to acknowlege him as king of Sweden. When famine compelled Christian to relinquish the siege, he had recourse to fraud; and having enticed a deputation from the senate, among whom was Gustavus, on board his ship, he set sail, and treacherously carried his captives to Denmark, where Gustavus spent a year in confinement in the custody of his maternal relative, Erich Baner, lord of Kalloe, in Jutland. While under confinement, Gustavus heard such alarming rumors of the expedition which the king was preparing against Sweden, that, irritated beyond endurance, he broke his parole, and escaped in the disguise of a pilgrim, or, according to others, as a drover, and after encountering numerous dangers, reached Lubeck (Sept., 1519), from which he was with difficulty conveyed to Sweden, where he landed, in May, 1520, near Calmar, the only place of note, except Stockholm, that still held out against the Danes. Gustavus with difficulty made his way into the castle of Calmar, which was defended by foreign mercenaries; but as his admonitions to the garrison to show more zeal in their defense were met by threats of delivering him to the Danes, he left Calmar, and took refuge among his father's peasantry in Smaaland. The Smaalanders had, however, already taken the oaths of allegiance to the envoys who had been sent through the country by Christian II. to ascertain the sentiments of the people, and Gustavus was soon compelled to retreat to Dalecarlia, where he wandered for several months, in poverty and disguise, with a price set on his head, and finally made his way, penniless and almost naked, to the house of his brother-in-law, Joachim Brahe, just as the latter was preparing to obey the summons of Christian II. to attend his coronation. Having failed to dissuade Brahe from attending this ceremony, which took place in Nov., 1520, Gustavus retired to his father's property of Räfsnäs, where he remained till he heard of the massacre known as the Blood-bath, which followed three days after the coronation, and in which, on the plea of their being the enemies of the true church, the greater number of the nobles and leaders of Sweden, including Brahe himself and Gustavus's father, Eric Johansson, were slaughtered in cold blood. Gustavus next retreated to the less frequented parts of Dalecarlia, where for a time he earned his living as a field-laborer, and more than once owed his life and safety to the generosity of the peasant-women of the district. This period of his life has been so long made the subject of traditionary lore and romance, that it is difficult now to separate the true from the false; but the fame of his supposed adventures still lives in the minds of the people of Sweden, who cherish as sacred every spot associated with his wanderings and dangers. His appeals to the Dalecarlians met with no success, until his account of the tyranny of the Danes was corroborated by the testimony of several fugitives from Stockholm, when a reaction followed, the national enthusiasm was roused, and the men of Dalecarlia, having called together a diet at Mora, proclaimed him head of their own and other communes of Sweden.

This was the turning-point in his life, for the peasantry now flocked around him from every side; and before another year had passed, many of the strongest posts of the enemy had fallen into his hands, and he was able to enter upon the siege of Stockholm, which terminated in 1523, when Christian II. was compelled by his enraged subjects to resign the crown, and retire from Denmark. His forcible abdication brought the Scandinavian union to a sudden close, after it had existed for a period of 126 years; for when Frederick I., the successor of Christian, demanded his recognition in Sweden, conformably to the union of Calmar, the Swedes declared at the diet of Strengnaes that they would have no other king but Gustavus Ericsson. But although Gustavus was at once recognized as king, he was not crowned till two years later, in consequence of his unwillingness to receive the crown from the hands of the Romish bishops. The king early showed his determination to favor the Lutheran doctrines, and to cripple the power of the Romish clergy, on whom he laid a large proportion

of the heavy imposts raised to meet the expenses of the war; and although his opinions were for a long time not favorably received by the people, he finally succeeded in establishing the reformation in Sweden.

The disaffection of the peasantry, who threatened to destroy the nobility, and the imprudence of the Lutheran clergy, who tried to force the people to adopt the reformed doctrines, combined to thwart many of Gustavus's schemes for the improvement of the country, while his latter years were disturbed and embittered by the jealousy and dissensions of his sons, Eric and John. Yet, notwithstanding these sources of disquietude, Gustavus effected more than any other Swedish monarch has ever done for the welfare of the people. He had found Sweden a wilderness, devoid of all cultivation, and a prey to the turbulence of the people and the rapacity of the nobles; and after forty years' rule, he left it a peaceful and civilized realm, with a full exchequer, and a well-organized army of 15,000 men, and a good fleet, which were both his creations. He promoted trade at home and abroad. Every profession and trade received his attention and fostering care, and schools and colleges owed their revival, after the decay of the older Roman Catholic institutions, to him. He made commercial treaties with foreign nations, and established fairs for foreign traders. In his reign, roads and bridges were made in every part of the country, and canals begun, one of which has only recently been brought to completion. In his relations with his subjects, Gustavus was firm, and sometimes severe, but seldom unjust, except in his dealings towards the Romish clergy, whom he despoiled with something like rapacity of all their lands and funds. He did much, however, to promote the cause of Lutheranism, although he took care that the reformed clergy should be dependent on the crown, and enjoy only very moderate emoluments. To him the various tribes of Lapps were indebted for the diffusion of Christianity among them by Lutheran missionaries; while the Finns owed to him the first works of instruction, Bibles, and hymn-books printed in their own language. Gustavus was methodical, just, moral, and abstemious in his mode of life; an able administrator; and, with the exception of a tendency to avarice, possessed few qualities that are unworthy of esteem. He was three times married, and had ten children. The name of Vasa, which has been supposed to be an ancient patronymic in his family, but erroneously, since surnames were not in use among the Swedish nobility until a later date, was adopted by him subsequently to his accession, and is conjectured by the historian Gejer (q. v.) and others to have been probably derived from his arms, which bore originally a black fascine used in storming, and afterwards drawn like a vase, but changed by Gustavus to yellow, from whence it came to be mistaken for a sheaf. By an act of the diet of 1544, at Westeraas, the crown was declared hereditary in the male descendants of Gustavus; in conformity with which, his eldest son Eric (q. v.) succeeded to the throne on his death in 1560.

GUSTAVUS II. (ADOLPHUS) was b. at Stockholm, Dec. 9, 1594, and d. in 1632 on the field of battle at Lützen. He was the grandson of Gustavus Vasa, by his youngest son, Charles IX., at whose death, in 1611, he succeeded to the throne of Sweden. Gustavus had been strictly brought up in the Lutheran faith, and carefully trained in habits of business, and was one of the most accomplished princes of his age. He was acquainted with eight languages, five of which he spoke and wrote fluently, was well read in the classics and ancient history; proficient in music, and excelled in all warlike and manly exercises. At his accession to power, he found the country involved in wars abroad, and disorders at home, arising from the disputed succession of his father, who had been elected king on the exclusion of his nephew, Sigismund, king of Poland, the direct heir, whose profession of the Roman Catholic religion made him obnoxious to the Swedish people, and virtually annulled his claims to the crown. The first act of Gustavus was to secure the hearty co-operation of the nobles, whose privileges he confirmed, and made dependent upon the performance of military service to the crown, and thus laid the foundation of an essentially feudal or military form of government, in which the nobles held their lands directly, and the peasantry indirectly, under the crown. In addition to these two bodies, which had formerly constituted the national diet, Gustavus for the first time admitted special delegates of the army into the assembly as assessors to the nobles. Having thus organized the internal government, and succeeded in levying heavy imposts and raising some companies of efficient troops, he inaugurated his military career by a war with Denmark, which at that time occupied the Baltic districts of the Swedish territories, and thus completely cut off the Swedes from direct communication with the continent of eastern Europe. The war continued for a year, and terminated in a peace between the two countries, by which Gustavus renounced his claims on the Lappish districts and other disputed territory, and recovered possession, under certain conditions, of Calmar, Oeland, Elfsborg, and the province of Gottenborg.

Having thus gained an outlet on the Baltic, secured a peaceful ally in the king of Denmark, and concluded an allegiance with the Netherlands, Gustavus turned his attention to the Russian war, which, after a fluctuating success, was concluded in 1617. by the treaty of Stolbova, by which Sweden obtained supreme dominion over Ingermanland and Karelia, and part of Lifland, while Russian recovered Novogorod and all

other conquests made by the Swedes. The boundary of the Swedish territory, which then included the site of the future St. Petersburg, was marked, after the peace, by a stone which bore the three crowns of Sweden above a Latin inscription, recording that it marked the limits of the dominions of Gustavus Adolphus, king of Sweden. The disputes with Poland still, however, remained undecided; and in 1621 war was openly declared between the two countries, and was continued, with occasional intermissions, till 1629, when it terminated in a six years' truce, which was settled by a treaty that secured reciprocity of trade and freedom of religion to the natives of both countries, and left Gustavus master of Elbing, Braunsberg, Pillau, and Memel.

This peace enabled the king to mature the plans he had long cherished in regard to Germany; and having made various administrative reforms, and availed himself of the short interval of peace to promote the material prosperity of the country, he remitted the charge of the government and the care of his infant daughter Christina to his chancellor Oxenstiern, and set sail, in the summer of 1630, with an army of about 15,000 men, to aid the Protestants of Germany in their hard struggle against the Catholic league, which was backed by the power of the empire.

Everything favored the success of the Swedes, who drove the imperialists from Pomerania, and took Stettin. The childless duke of Pomerania engaged, in return for Swedish aid, that the dukedom should, after his death, be given up to Sweden until the expenses of the war were fully repaid; whilst France, through hatred of the empire, agreed to furnish Gustavus with a subsidy of 400,000 rix-dollars as long as he maintained an army of 36,000 men. Wallenstein had also retired from the service of the emperor. But while the Swedes were besieging Spandau and Küstrin, the city of Magdeburg, which had applied to Gustavus for assistance, was taken in 1631 by the imperial general, Tilly, whose troops perpetrated the most terrible atrocities against the unfortunate inhabitants. Although Gustavus could not save Magdeburg, he soon after its fall inflicted a defeat on the imperialists at Breitenfeld, which excited the respect and fear of the Catholics, who thenceforward ceased to despise the "snow-king and his body-guard," as they designated Gustavus and his small army. The king now advanced into Franconia, and after allowing his army to recruit their strength in the rich bishoprics of Würzburg and Bamberg, took the Palatinate and Mainz, where he held a splendid court, surrounded by numerous princes and ambassadors. In the spring of 1632 the Swedes, in the face of Tilly's army, crossed the Danube, and gained a decisive victory at Ingolstadt, where Tilly was mortally wounded. From thence the march to Munich was one continued triumph, and wherever Gustavus appeared he was received by the populace as their guardian angel. The road to Vienna was now open to him, and the fate of the emperor would have been sealed, had the latter not recalled his general, Wallenstein, who, having accepted office on his own terms, gathered together a large army, with which he advanced on Nuremberg; but after standing a desperate assault of the Swedes, he was obliged to retire into Thuringia. The unfavorable season and the bad roads hindered Gustavus from attacking the imperialists at the time he intended, but on Nov. 6, 1632, the two armies came finally face to face at Lützen. As usual, the Swedes began by singing Luther's hymn, *Eine feste Burg ist unser Gott*, and a hymn composed by the king. Gustavus now made an address to the army, and swinging his sword above his head, he gave the word of command, and with the cry of "Onwards!" he rushed forward, followed by the eager troops, who were commanded conjointly by himself and Bernhard of Saxe-Weimar. Victory was already on the side of the Swedes, when a strong reinforcement of imperialists appeared under the command of Pappenheim. Gustavus seeing that his troops wavered under this fresh attack, rode hastily forward, when, having come too near a squadron of Croats, he received a shot in his arm, and, as he was turning aside, another in the back, which caused him to fall from his horse. The sight of the riderless animal spread dismay and fury among the Swedes; but before they could advance to his rescue, a party of Croats had thrown themselves between the king and his army; and it was not till after many hours' hard fighting, and when the field was strewn with 10,000 dead and wounded, that they recovered the body of the king, which had been plundered, stripped, and covered with wounds. The artillery of the enemy fell into the hands of the Swedes, who remained masters of the field, after having fought with an impetuosity that nothing could resist. A rumor long prevailed that the shot in the back which caused the king to fall was from the hand of Albert duke of Saxe-Lauenburg, but it appears that there was no just ground for the suspicion.

Although Gustavus was eminently a warlike king, he made many salutary changes in the internal administration of his country, and devoted his short intervals of peace to the promotion of commerce and manufactures. He was pre-eminently religious, and his success in battle is perhaps to be ascribed not only to a better mode of warfare, and the stricter discipline which he enforced, but also still more to the moral influence which his deep-seated piety and his personal character inspired among his soldiers. The spot where he fell on the field of Lützen was long marked by the *Schwedenstein*, or Swede's stone, erected by his servant, Jacob Erichsson, on the night after the battle. Its place has now been taken by a noble monument erected to his memory by the German people on the occasion of the second centenary of the battle held in 1832.

GUSTAVUS III.,-king of Sweden, was b. at Stockholm in 1746, and succeeded his father, Adolphus Frederick, in 1771, at a period when the country was distracted by the intrigues of the rival political parties of Horn and Gyllenborg, known as the "Hats" and "Caps." Finding that the people, who were thoroughly wearied by the misrule of the nobles, were ready for any change, Gustavus covertly fomented the general discontent, and having raised a fictitious rebellion, through the agency of his friend and adherent, capt. Hellichius, he collected together a large body of troops, on pretense, of restoring order, and having arrested the council in a body, convoked the diet, and laid before it a newly framed constitution, to which the assembly was compelled to subscribe. A revolution was thus effected without the shedding of blood, and by a stroke of the pen Gustavus recovered all the regal powers that had been gradually lost by his immediate predecessors. Gustavus acted with great moderation after this successful *coup d'état;* and he might have long retained the advantages he had gained, if his love of display, and his wish to emulate the king of France in extravagance and magnificence, had not led him into profuse expenditure, which embarrassed the finances; at the same time, the introduction of the manners and usages of Versailles at his own court irritated the national party, while it undoubtedly tended to demoralize the upper classes, and through them the nation generally. In 1788 he engaged in war with Russia, at the moment that the empire was engaged in active hostilities against the Turks, but derived no advantages from the contest. On the breaking out of the French revolution he combined with the other monarchs against France, and applied to the diet for funds to assist the Bourbons. His repeated applications having been decisively rejected, the nobles, amongst whom he had many enemies, took advantage of his general unpopularity, and entered into a conspiracy against him, the leaders of which were Ribbing, Horn, and Pechlin. On Mar. 16, 1792, Gustavus was mortally wounded by their agent, a capt. Ankarström (q.v.), at a masked ball in the opera-house which he had himself built. The pistol had been loaded with broken shot, which rendered the wound especially painful, and the king suffered the most dreadful agony for thirteen days before his death.

Gustavus was a man of varied learning, and the author of several dramatic works and poems of considerable merit. His writings have been published in a collective form both in Swedish and French. In 1788 Gustavus deposited certain papers in the library of Upsala, which excited much interest from the fact that they were not to be opened for fifty years after his death. Their publication, which was confided in 1842 to Gejer, disappointed the general expectation, as they were found to consist of historical notes and letters of little value.

GUSTAVUS IV., the son and successor of Gustavus III., was b. Nov. 1, 1778, proclaimed king Mar. 29, 1792, and died in 1837. His uncle, duke of Sudermania, acted as regent during his minority. The young king, on his accession to power, at once gave evidence of the high estimate at which he held the kingly power, and his first act was to join the third coalition against France, contrary to the wishes of his people. Hatred of Napoleon soon, however, became the guiding influence of his life. The result of his decided line of policy led to the occupation of Swedish Pomerania by French troops under marshal Brune, who took Stralsund and Riga from the Swedes in 1807, and thus deprived them of the last of their German possessions. The king opened all his ports to English vessels, and thereby involved himself in a war with Russia. The scene of these hostilities was Finland, which the Swedes were obliged to give up to Russia at the close of 1808. Norway became next the scene of war, the Swedes being assisted by an English subsidy of 10,000 men, who, however, speedily returned to England when they found that Gustavus intended to send them to Finland. The unfortunate war with Russia, which had been excited entirely through the folly of the king, gave rise to so much discontent in Sweden, that a conspiracy was set on foot by several officers and nobles, the object of which was to dethrone the unpopular monarch. The conspirators took forcible possession of the palace at Stockholm, and placed him under arrest; and after an ineffectual attempt at escape, he consented to abdicate the throne, Mar. 29, 1809. After wandering for a time from place to place, he finally settled at St. Gall, where he died, forgotten and in poverty, in 1837. His uncle, the duke of Sudermania, after acting as regent of the kingdom, was finally proclaimed king, under the title of Charles XIII., at the diet which met in May, 1809. By the consent of the diet, Charles XIV. (Bernadotte) paid over the value of the private estates of the family of Vasa for the benefit of Gustavus and his children; but as the dethroned king refused to receive any of this money directly, or to accept the pension which the Swedish government had settled upon him, he was often in pecuniary difficulties, from which he was clandestinely relieved by his divorced queen and children, who contrived, without his knowledge, to supply his wants.

GUSTAVUS ADOLPHUS SOCIETY, instituted among German Protestants in commemoration of the 200th anniversary of the death of Gustavus Adolphus, which occurred Nov. 16, 1632. Its object is to assist weak congregations of Protestant Christians in all parts of the world. It awakens much interest in Germany and has extended into the Netherlands and Sweden. Its annual income is $150,000, with which it aids more than 900 congregations.

GÜ'STROW, a t. of Mecklenburg-Schwerin, and long the residence of the princes, is situated on the left bank of the Nebel, 27 m. s. of Rostock. Among the principal buildings are the gymnasium, the old castle (now the workhouse), the fine Gothic cathedral, and the town-house. The former ramparts have been converted into pleasant gardens. Güstrow carries on distillation and beer-brewing, and has several water-mills. Pop. '75, 10,923.

GUTENBERG, JOHANNES, or HENNE, whose proper name was GENSFLEISCH, or GÄNSFLEISCH, and who is regarded by the Germans as the inventor of the art of employing movable types in printing, was b. near the close of the 14th c., at Mainz. He was sprung from a patrician family, which took the names of Gutenberg and Gensfleisch, from two estates in its possession. Of Gutenberg's early life no particulars are known, but it seems probable that he devoted himself at an early age to mechanical arts. In the year 1434 he was living in Strasburg, and there, in 1436, made a contract with Andrew Dryzehn, or Dritzehn, and others, by which he bound himself to instruct them in all his "secret and wonderful arts," and to employ these for their common advantage. This undertaking, which comprehended the first steps in the art of printing, was frustrated by the death of Dryzehn, more particularly as George Dryzehn, a brother of the deceased, commenced a lawsuit with Gutenberg, which was decided against the latter. When and where the first attempts in the art of printing were made, cannot with certainty be ascertained, as the works printed by Gutenberg bear neither name nor date; this much is, however, certain—namely, that movable wooden types were first employed by him about the year 1438. In 1443 he returned from Strasburg to Mainz, where, in 1449 or 1450, he entered into partnership with Johannes Faust, or Fust, a wealthy goldsmith. Faust furnished the money required to set up a printing-press, in which the Latin Bible was printed for the first time. This partnership was, however, dissolved after the lapse of a few years. Faust had made large advances, which Gutenberg was now to refund, but as he possessed neither the power nor the inclination, the matter was brought before a court of justice. The result was that Faust retained the printing concern, which he carried on and brought to perfection, in conjunction with Peter Schöffer of Gernsheim. By the assistance of Conrad Hummer, a councilor of Mainz, Gutenberg was again enabled to set up a press, from which, in all probability, proceeded *Hermanni de Saldis Speculum Sacerdotum*, printed in quarto without date or name. According to some, four editions of the *Donatus* were likewise printed by Gutenberg, while others ascribe them to Faust and Schöffer. In 1457 appeared the Latin *Psalterium*, or rather a breviary containing psalms, with antiphones, collects, etc., and arranged for choruses for Sundays and holidays. This specimen of the art of printing, remarkable as being the first bearing the name of the printer and the locality, as well as the year and day of its completion, and valued by Dibdin at £10,000, was printed with an elegance which sufficiently proves the rapid progress that had been made in the newly invented art, and the diligence with which it had been prosecuted. Gutenberg's printing establishment existed till 1465, in Mainz. He died, as is generally believed, Feb. 24, 1468, in which year the archbishop, elector of Mainz, appointed him one of his courtiers, and raised him to the rank of a noble, though others place his death at the close of the previous year. The evidence in favor of Gutenberg's being the inventor of printing, is considered by his countrymen quite conclusive. They adduce the testimony of Ulrich Zell of Hanau, who first introduced the art into Cologne (1462), and who declares that "this noble art was invented for the first time in Germany, at Mainz, upon the Rhine . . . . by a citizen of Mainz, named John Gutenberg." Similarly speaks Wimpfeling, a learned Alsacian (born at Strasburg, 1451, and partly contemporaneous with Gutenberg). "In the year 1440, under the reign of Frederick III., an almost divine benefit was conferred on mankind by John Gutenberg, who first discovered the art of printing." So, too, Trithemus (born 1462, died 1516). "At this epoch, this memorable art (viz., of printing) was devised and invented by Gutenberg, a citizen of Mainz;" while Johann Schöffer, son of Peter Schöffer (the partner of Faust), in his preface to a German translation of Livy (Mainz, 1505), expressly affirms that "at Mainz originally the admirable art of printing was invented particularly by the ingenious Johann Gutenberg, 1450 A.D.," and that it was "subsequently improved and propagated to posterity by the wealth and labors of Johann Fust and Peter Schöffer." That Gutenberg may have received the first hints of his invention from the Dutch xylography, is not denied. See COSTER. Ulrich Zell himself admits this; but the invention of typography, and beyond all doubt of the printing-press, must be ascribed to the German.—Compare Oberlin's *Essai d'Annales de la Vie de Gutenberg* (Strasburg, 1801); Née de la Rochelle's *Eloge Historique de J. Gutenberg* (Par. 1811); Gama's *Essai Historique de Gutenberg* (Par. 1857); and Lamartine's *Gutenberg, l'Inventeur de l'Imprimerie* (Par. 1853).

GUTHRIE, a co. in s.w. Iowa on branches of Raccoon river, and the Chicago, Rock Island and Pacific railroad; 576 sq.m.; pop. '80, 14,863. The surface is varied, and the soil fertile. Chief productions: wheat, corn, oats, and pork. Co. seat, Guthrie Center.

GUTHRIE, JAMES, LL.D., 1792–1869; b. Ky.; became prominent as a member of the bar; was several times elected to the legislature and presided over the state constitutional

convention in 1850. In 1853 he was secretary of the treasury in the Pierce administration, and in 1865 was chosen U.S. senator, but on account of ill-health did not take his seat.

GUTHRIE, THOMAS, D.D., an eminent pulpit orator, philanthropist, and social reformer, was b. in 1803, at Brechin, Forfarshire, where his father was a merchant and banker. He went through the curriculum of study prescribed by the church of Scotland to candidates for the ministry at the university of Edinburgh, and devoted two additional winters to the study of chemistry, natural history, and anatomy. Meanwhile, he was licensed as a preacher by the presbytery of Brechin, in 1825. He subsequently spent six months in Paris, studying comparative anatomy, chemistry, and natural philosophy. Returning to Scotland, he for two years conducted, on behalf of his family, the affairs of a bank agency in Brechin. In 1830 he became minister of Arbirlot, in his native county; and in 1837 was appointed one of the ministers of Old Greyfriars parish in Edinburgh. Here his eloquence, combined with devoted labors to reclaim the degraded population of one of the worst districts of the city, soon won for him a high place in public estimation. In 1843 Guthrie joined the Free church, and for a long series of years continued to minister to a large and influential congregation in Edinburgh. In 1845–46 he performed a great service to the Free church, in his advocacy throughout the country of its scheme for providing manses or residences for its ministers. Guthrie's zeal, however, was not diverted into mere denominational or sectarian channels. He came forward, in 1847, as the advocate of ragged schools (q.v.); and to him the rapid extension of the system over the kingdom is very much to be ascribed. He also earnestly exerted himself, in many ways, in opposition to intemperance and other prevailing vices. Guthrie possessed great rhetorical talent; and his style was remarkable for the abundance and variety of the illustrations he used. Few public speakers have ever blended solemnity and deep pathos so intimately with the humorous, his tendency to which has more frequently than anything else been pointed out as his fault. Guthrie always displayed a generous sympathy with all that tends to progress or improvement of any kind. He was moderator of the general assembly of the Free church of Scotland in May, 1862. Guthrie's most important published works are—*The Gospel in Ezekiel, a series of Discourses* (A. and C. Black, Edin. 1855); *The Way to Life*, a volume of sermons (Edin. 1862); *A Plea for Drunkards and against Drunkenness*, a pamphlet (Edin. 1856); *A Plea for Ragged Schools*, a pamphlet (Edin. 1847), followed by a second and a third plea, the latter under the title of *Seed-time and Harvest of Ragged Schools* (Edin. 1862); *The City: its Sins and Sorrows* (Edin. 1857). Perhaps his *Pleas* furnish the best published specimens of Dr. Guthrie's eloquence. For some years before his death he acted as editor of the *Sunday Magazine*, founded in 1864, in which year he retired from his regular ministrations. He died Feb. 24, 1873. His *Autobiography and Memoir* was published by his sons.

GUTHRIE, WILLIAM, a political, historical, and miscellaneous writer, was b. at Brechin, in Forfarshire, in 1708, and educated at King's college, Aberdeen. At an early period, he removed to London, where he worked hard for forty years as a man of letters. He died Mar., 1770. Among his various works are a *History of England* (3 vols. Lond. 1744–50); and *A Historical and Geographical Grammar* (1st edition, 1770; 24th edition, 1827); a useful manual of information, which enjoyed immense popularity in its time

GUT MANUFACTURE, an unpleasant though rather important branch of manufacture, the operations of which consist in preparing the membranes of animal intestines for various useful purposes. The French call it *boyawderie*, from *boyau*, intestine, and have placed it under stringent legal regulations, on account of its offensive and pestiferous character, especially when conducted in a populous quarter of a town, as at the Rue de la Boyawderie, in Paris. One branch of gut manufacture has been described under GOLDBEATERS' SKIN. *Cat-gut*, as it is called, is made from the intestines of sheep, which are first cleansed and freed from loose fat, then prepared by soaking and partial putrefaction, to loosen the different membranes of which the intestine is composed. These are then separated by scraping, then further soaked in clean water and scraped separately. After this, they are treated with a solution of potash, and drawn by women through a sort of thimble, and sorted for twisting into threads. They are then exposed to fumes of sulphurous acid, given off from burning sulphur, which deodorizes them, and prevents subsequent putrefaction. The small intestines are used for cat-gut, the large intestines are simply scraped and salted, for the use of sausage-makers and by confectioners, and for tying over preserve and pickle jars, etc. The coarser kinds of cat-gut strings are used for pulley and lathe bands, strings for archery-bows, drill-bows, hatters-bows, and other purposes where a strong cord subject to friction is required; the finer kinds are twisted into whip-cord, and are used for fishing-tackle and the strings of musical instruments. For the latter purpose a very superior quality is required. The best, called *Roman strings*, are made chiefly at Milan. Our manufacturers have never been able to equal these, and this is attributed by some to the fact that the Italian sheep are much leaner than ours, and the membranes of lean animals are tougher than those which are highly fattened and rapidly fed up to marketable size.

GUTS MUTHS, JOH. CHRISTOPH. FRIEDR., a German instructor of youth, was b. at Quedlinburg, in Prussian Saxony, Aug. 9, 1759, studied at Halle, and subsequently became attached to Salzmann's institution at Schnepfenthal. There he gave himself specially to the elaboration, theoretical and practical, of gymnastics (q.v.) as a branch of education; and from him it has passed into the curriculum of other German institutions. In 1793 Guts Muths published his *Gymnastik für die Jugend*, which has become a classic work on the subject, and the basis of all subsequent treatises. Besides several other works on his favorite subject, Guts Muths holds a distinguished place as a writer on geography. He died in 1839. His centennial anniversary was celebrated Aug. 9, 1859, at Schnepfenthal.

GUTTA-PERCHA (pronounced *pertsha*), a substance in many respects similar to caoutchouc, is the dried milky juice of a tree, *isonandra gutta*, which is found in the peninsula of Malacca and the Malayan archipelago. The tree belongs to the natural order *sapotaceæ*. It is a very large tree, the trunk being sometimes 3 ft. in diameter, although it is of little use as a timber tree, the wood being spongy. The leaves are alternate, on long stalks, obovate-oblong, entire, somewhat leathery, green above, and of a golden color beneath. The flowers are in little tufts in the axils of the leaves, small, each on a distinct stalk; the corolla having a short tube and 6 elliptical segments; they have 12 stamens and 1 pistil. The name gutta-percha is Malayan, *gutta* signifying the concrete juice of a plant, and *percha* being the name of the particular tree from which it is obtained. The present mode of obtaining the gutta-percha is a most destructive one. The finest trees are selected and cut down, and the bark stripped off; between the wood and bark, a milky juice is found; which is scraped up into little troughs made of plantain leaves. This is the gutta-percha, which, as it hardens, is kneaded into cakes, and exported.

Gutta-percha was known in Europe long before its peculiar character and uses were made known. It was from time to time brought home by voyagers, in the form of drinking-bowls, which excited much curiosity on account of the material of which they were made. Some thought it a species of india-rubber, others asserted it to be a kind of wood, which they named *mazer-wood*, from its use in making these drinking-cups. But we are chiefly indebted to Dr. William Montgomerie of the *Indian medical service*, whose introduction of it in 1843 was rewarded by the gold medal of the society of arts. He first noticed that the Malays used it for making handles to their knives, etc.; and it immediately occurred to him that it might be of great use in a variety of ways, especially in making handles for surgical instruments. Since that time, the importation of gutta-percha has increased amazingly; in 1860 it exceeded 16,000 cwts. The years 1864, 1865, 1870, and 1871 were marked by large imports, varying from 25,933 cwts. to 35,636 cwts.; in the years 1872 to 1876, the imports varied from 19,627 cwts. to 54,898 cwts. It has been used for making a vast variety of ornamental and useful articles; but its most important application has been the coating of marine electric telegraph wires. In this application, as in most others, its inherent defect, arising from the readiness with which it becomes oxidized and decomposed, is unfortunately manifesting itself seriously, and a substitute having greater stability is anxiously looked for.

Its great value arises from the ease with which it can be worked, and its being so complete a non-conductor of electricity. It softens in warm water, and can be molded into any form in that state; as when soft it is not sticky, and turns well out of molds. It will always be of great value as a material in which to take casts, as it can in the soft state be made to take the sharpest forms most faithfully, and as it quickly becomes hard, and preserves its shape if not too thin, the range of its utility in this respect is very extensive. Golf balls are made of gutta-percha.

It is imported in blocks and lumps of five to ten pounds weight, in various forms, chiefly like large cakes, or rounded into gourd-like lumps. It has a very light reddish-brown, or almost a flesh color, is full of irregular pores elongated in the direction in which the mass has been kneaded. It has a cork-like appearance when cut, and a peculiar cheese-like odor. Before it can be used, it has to undergo some preparation. This consists in slicing the lumps into thin shavings, which are placed in a *deviling* or tearing machine revolving in a trough of hot water. This reduces the shavings to exceedingly small pieces, which, by the agitation of the tearing-teeth, are washed free from many impurities, especially fragments of the bark of the tree, which, if not separated, would interfere with the compactness of its texture, which is one of its most important qualities. The small fragments, when sufficiently cleansed, are kneaded into masses which are rolled several times between heated cylinders, which press out any air or water, and render the mass uniform in texture. It is then rolled between heated steel rollers into sheets of various thickness for use, or is formed into rods, pipes for water, or speaking-tubes, and an endless number of other articles.

Gutta-percha differs very materially from caoutchouc or india-rubber in being non-elastic, or elastic only in a very small degree. Notwithstanding this very striking character of caoutchouc, the two articles are very often confounded in the public mind, probably from the similarity of their applications. It is most probable that india-rubber

will eventually displace gutta-percha in some of its most important applications, and especially in the coating of telegraph wires, to which purpose it has been successfully applied in America. There are two or three kinds of gutta-percha known in commerce, and it is more than probable these are yielded by different species: that from Singapore is esteemed the best, and is distinguished by the Malay traders as *gutta taban* or *tuban;* that of Borneo is of less value—this is called *gutta-percha* by the traders, and has given the general name to all; and another kind goes by the name or *gutta girek.* The first two are those generally known in our markets.

Gutta-percha is turned by surgeons to various uses, chiefly for splints and covering moist applications to retard evaporation. A splint of gutta-percha is made by taking a rigid board of the substance cut to the desired shape, soaking it in hot water, and then bandaging it to the limb. In a few minutes the gutta-percha is found hard, and modeled to the shape of the parts. The cloth of gutta-percha is sometimes used instead of oiled silk, as it is about half the price; it is, however, apt to tear, does not stand much heat, and is less flexible. Gutta-percha being readily soluble in chloroform, such a solution is sometimes used for covering raw surfaces, as when the chloroform evaporates it leaves a pellicle of solid gutta-percha. It has also been used for stopping hollow teeth.

GUTTA-PERCHA. See CAOUTCHOUC.

GUTTA RO'SEA, a kind of cutaneous eruption on the face, popularly called "brandy blossoms," from its frequent occurrence in dissipated persons advanced in life. It is an affection very difficult of cure, and to be treated chiefly by a careful regimen.

GUTTA SERE'NA, an old name for amaurosis (q.v.).

GUTTÆ, pendant ornaments attached to the underside of the mutules (q.v.), and under the triglyphs of the Doric order (see fig. under COLUMN). They are generally in the form of the frustrum of a cone, but are sometimes cylindrical. It is not clear what their origin may have been, whether, as the name indicates, they represent drops of water or icicles. Alberti calls them nails; and it does seem likely that as many other parts of Greek architecture have been shown to be derived from structural conditions (see ENTABLATURE), so these also should owe their origin to a similar cause. They have most probably been derived from the wooden pins or plugs, which were no doubt much more commonly used than iron nails, and of which it is still common to leave the ends projecting in any large wooden structure, such as the centering of a bridge. Whatever their origin, they were modified by the Greeks into a graceful ornament.

GUT'TÉ, or GUTTY, from the Latin *gutta,* a drop, is said in heraldry of a field, or any particular charge on the field, covered with drops. When the drops are red, they are supposed to represent drops of blood, and the bearing is said to be *gutté de sang.* In this case, some great suffering or labor, such as fighting for the recovery of the Holy Land, is indicated. Where they are blue, again, they represent tears, and the bearing is said to be *gutté de larmes.* When white, they are called drops of water, and the bearing is described as *gutté de l'eau;* but Nisbet is of opinion that tears are intended in this case also, and that repentance or penitence is signified by both.

GUTTER, an open channel for conveying water from buildings, roads, etc. Gutters are necessary for the preservation of such structures, and have thus been in use in all ages. The Greeks, who constructed their roofs with a simple span, used gutters at the eaves of their buildings, hollowed out of the stone which formed the cornice. These gutters discharged their contents on the ground at intervals through small gargoyles (q.v.), usually in the shape of lions' heads. The Romans followed this example, and also formed gutters with tiles laid in cement.

In the middle ages, the eaves seem to have been left without gutters, until, owing to the castles being frequently built on dry, rocky sites, it was found desirable to collect the rain-water and preserve it in cisterns. Stone or wooden eaves, gutters, and pipes were used for this purpose. In ecclesiastical architecture, when the construction became complicated, it was necessary to convey the water from the roofs with great care, so as to prevent damage to the building. It was collected at the eaves of the central roof, and by means of well-projected gargoyles, thrown along channels formed in the crest of the buttresses, and so carried beyond the walls of the building, and thrown off through gargoyles in a number of small streams, which dispersed the water before it reached the ground. This acted well in calm weather, but during storms the water was blown back all over the building, which, in case of its being of a porous stone, softened, and became liable to decay. This led to the use of lead pipes, which carried the water directly to the ground, and discharged it into open gutters. At first, the pipes were used for conveying the water from the main roof to the roof of the side-chapels, whence it was discharged by gargoyles. Pipes conveying the water to the base of the building were first employed in England, where they seem to have come into use during the 14th century. They were formed with great taste, and had ornamental cups or cisterns at top to receive the water from the mouth of the gargoyle. They were then, with considerable foresight, made *square* in form, not circular, as they usually now are. The advantage of the former section is, that in case the water in the pipe being frozen,

there is room for the expanding ice to swell out by slightly changing the form of the square.

Pipes for conducting rain-water have the great advantage of saving foot-passengers the annoyance they meet with from the discharge of the water from gargoyles; but the latter have the advantage of being more easily inspected and kept in good order. Whenever a gargoyle is choked, it shows the accident by its awkward spouting; but a lead pipe frequently bursts, and does much damage before the leak is discovered. See SEWAGE.

GUTTIFERÆ, or CLUSIA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives of tropical countries, very generally secreting an acrid yellow resinous juice. A few are epiphytes. The leaves are opposite, destitute of stipules, leathery, and entire. In botanical characters, this order is allied to *hypericinæ*. It contains about 150 known species, the greater part of them South American, although all tropical countries produce some. The resinous secretions of some are valuable, particularly of those trees which yield gamboge (q.v.) and tacamahaca (q.v.). See also CLUSIA.—A few species afford valuable timber. See CALOPHYLLUM.—The flowers of some are very fragrant; those of *mesua ferrea* are found in a dried state in every bazaar in India, and are used as a perfume.—The fruit of some is very highly esteemed; the mangosteen (q.v.) has been described as the finest fruit in the world. The mammee apple (q.v.) is another of the most celebrated fruits of this order.

GUTZKOW, KARL FERDINAND; 1811–78; b. Germany. He studied theology and philosophy, and published in 1831 *Forum der Journaliteratur*. In 1833 he published a novel entitled *Maha Guru*, the story of a god. Having associated himself with the journalist, W. Menzel, at Stuttgart, the two authors produced *Novellen; Soireen;* and *Oeffentliche Charaktere*. He earned the reputation as the leader of "Young Germany" through his drama *Nero*, his preface to Schleiermacher's letters on Frederich von Schlegel, and his novel, *Wally, die Zweiflerin*, all of which were published in 1835. For the last named novel he suffered a three months' imprisonment at Manheim, the tendency of his writings being considered detrimental to religion and social order. In 1847 he became the successor of Tieck as dramatist at the theater of Dresden, and from 1852 he edited a weekly journal at Frankfort. In 1864 he attempted suicide while suffering from temporary insanity; and although after his recovery he continued to write as voluminously as formerly, his productions showed henceforth decided traces of failing powers. On account of a return of his nervous malady, Gutzkow, in 1873, made a journey to Italy, and on his return took up his residence near Heidelberg. Although some time before his death he had been confined to his sick chamber at Frankfort, its occurrence in 1878 was due to accidental suffocation from smoke. He has won a great reputation, and is considered by many the foremost German novelist of his time. Among his numerous works are *Zur Philosophie der Geschichte; Blasedow*, a satirical tale; *Zopf und Schwerdt*, and *Urbild des Tartufe*, two comedies; *Urul Acosta*, a tragedy; *Die Ritter vom Geiste; Der Zauberer von Rom; Fritz Ellrodt*, and many other novels.

GUTZLAFF, KARL, a missionary, was b. at Pyritz, in Pomerania, July 8, 1803. At an early age he was apprenticed to a belt-maker in Stettin. Here he composed a poem, in which he expressed his earnest wish to become a missionary to the heathen, and in 1821 presented it to the king of Prussia. The king caused him to be placed in the missionary institution at Berlin. At the expiration of two years, he was removed to the Dutch missionary society at Rotterdam, and in Aug., 1826, was sent to Sumatra. Being detained at Java, he fixed his residence at Batavia, where he devoted himself to the study of Chinese. At the end of two years, having acquired a considerable knowledge of the language, and familiarized himself with the habits of the Chinese residents in Batavia, he determined to give up his connection with the Dutch society, and devote himself to the conversion of the Chinese. He joined Tomlin, the English missionary, and, in the summer of 1828, accompanied him to Siam. They settled at Bankok, the capital, partly for the purpose of preaching the gospel, partly to render themselves thoroughly acquainted with the Siamese language, and to perfect themselves in Chinese. For the sake of his health, he now, by the advice of a Chinese friend, undertook a voyage to China; and from this time, Macao became his principal station, and here he formed an intimate friendship with Robert Morrison. In conjunction with Medhurst and two other friends, Gutzlaff began a new translation of the Bible into Chinese. With the assistance of Morrison, he founded a society for the diffusion of useful knowledge in China, published a Chinese monthly magazine, and preached at Macao and elsewhere. Compare his *Journal of Three Voyages Along the Coast of China in* 1831, 1832, *and* 1833, *with Notice of Siam, Corea, and the Loo-choo Islands*. After the death of the elder Morrison, Gutzlaff was appointed chief interpreter to the British supervisional government in China, with a salary of £800. In this capacity he attempted, in May, 1835, to penetrate into the interior of the province of Fo-kien, but without success. At the same time, the printing of Christian books in the Chinese language, and even the distribution of Christian writings among the inhabitants of Canton, were prohibited. Thus restricted in his missionary career, Gutzlaff joined the British during the war with the Chinese, and his thorough acquaintance with the Chinese rendered his services of great value. He likewise contributed to bring about the peace in 1842. Finally, in

1844, he founded a Chinese society for the purpose of diffusing the gospel, by means of native Christians, in the interior of the country. To promote the objects of the mission, he, in 1849, returned to Europe, and visited England, Germany, and other countries. He returned to China, landing at Hong-kong in Jan., 1851, but died there, Aug. 9, of the same year. Gutzlaff published various works, in different languages, some of which are extremely valuable; the principal are *Geschichte des Chines; Reichs* (Stuttg. 1847), and *The Life of Taokuang* (Lond. 1851).

GUY OF WARWICK, an old English metrical romance which is known to have existed in French as early as the end of the 13th century. Its authorship has been assigned to Walter of Exeter, a Franciscan monk, and, although this supposition has been generally disputed, Tanner regards it as probable. The romance has been retouched by some French or Anglo-Norman minstrels, but is evidently of Saxon origin, and is allied to the story of Guido Tyrius in the *Jesta Romanorum*, and probably to the romance of *Sir Guy* quoted by Chaucer in his *Rime of Sir Topas*. The hero of this story is sir Guy of Warwick, who is said to have been the son of Siward, baron of Wallingford, to have married Felicia, the only daughter of Rohand, a famous Saxon warrior, to have become earl of Warwick in his wife's right, and after conquering Colbrond the Dane, to have lived as a hermit till his death in 929. The earliest English chronicler who mentions the story as historical is John Harding. Tanner is of the opinion that the first germ of romance dates from the battle of Brunanburgh, the "Vinheide" of the *Egils saga;* but though the story has some basis in tradition, the chief events of the hero's life are plainly mythical.

GUY, THOMAS, founder of Guy's hospital, Southwark, London, was b. at Horsleydown in 1644. He began business as a bookseller with a stock of about £200, dealing extensively in the importation of English Bibles from Holland (those printed at home being executed very badly); and, on this being stopped, contracted with the university of Oxford for the privilege of printing Bibles, which he continued to do for many years. His principal gains, however, arose from the not very creditable practice of purchasing, during queen Anne's wars, the prize-tickets of seamen at a large discount, and subsequently investing them in South Sea company's stock, by which means he amassed a fortune of nearly half a million sterling. In 1707 he built and furnished three wards of St. Thomas's hospital. In building and endowing the hospital in Southwark, which bears his name, he set apart £238,295, 16*s*. He was also a liberal benefactor to the stationer's company, and built and endowed almshouses and a library at Tamworth. Besides making bequests to Christ's hospital, and various other charities, he left £80,000 to be divided among those who could prove any degree of relationship to him. He was of mean appearance, with a melancholy expression of countenance, and during his whole lifetime had no other reputation than that of an intensely selfish and avaricious man. He died Dec. 27, 1724, aged 80.

GUYON, JEANNE BOUVIER DE LA MOTHE, well known in connection with the Quietist controversy (see QUIETISM), was b. at Montargis, in France, April 13, 1648. She had destined herself for the cloister, but at the earnest solicitation of her family married, at the age of 14, M. Guyon, the son of a rich contractor of public works. Being left a widow at 25, and still retaining her early religious leanings, she transferred her three children to the care of guardians, settling on them almost all her property. Being thus entirely withdrawn from secular affairs, she attracted much notice by the high tone of spirituality which her conversation breathed, and was invited by M. d'Arenthon, bishop of Geneva, to settle in his diocese, where she formed the acquaintance of a Barnabite, Père Lacombe, then in much repute as a director of souls. The mystic doctrines which she learned from this ecclesiastic, and which involved such a degree of self-abnegation as to suppose that the truly Christian soul must become indifferent not only to life and death, but even to its own salvation or perdition, having come to the knowledge of the bishop, he withdrew his protection from Madame Guyon. In consequence she left Geneva, and accompanied by Père Lacombe, went to various cities of Italy and France, and eventually to Paris, where they drew about them a number of followers. The reputed extravagances of Madame Guyon led to her being shut up by a royal order in the convent of the Visitation, from which, however, she was set free, at the instance of Madame de Maintenon, and through this lady obtained entrance into the highest circles of Paris and Versailles. It was now that she formed the acquaintance of Fenelon, who was completely won by her evidently sincere piety, and captivated by the earnestness and lofty spirituality of her views. He failed to see the evil consequences which they involved; and the confiding zeal with which he defended her not only against the misrepresentations with which she was assailed, but even against the too well founded imputations which her principles had drawn upon her, was the cause of his unhappy rupture with Bossuet. See FENELON. Madame Guyon having submitted her writings to Bossuet and other members of a royal commission, subscribed 34 articles which were drawn up by them, and promised to abstain from all further speculation on these subjects. But she failed to keep her promise, and not only drew again upon herself the hostility of the court, but also became the object of much scandal on account of her intimacy with Père Lacombe. That the latter imputation was a calumny, it is impossible to doubt; but Madame Guyon was again put under arrest, and imprisoned first at

Vincennes and Vaugirard, and ultimately in the Bastile. She was liberated in 1702, and henceforward lived in comparative privacy till her death, which took place at Blois in 1717. She is the author of several works, the chief of which are *Torrents Spirituels*, *Moyen Court de Faire Oraison*, and *Le Cantique des Cantiques interpreté selon le sens mystique*, together with an autobiography and letters, as also some spiritual poetry.

GUYON, RICHARD DEBAUFRE, a gen. in the Hungarian army during 1848–1849, was b. at Wolcott, near Bath, in England, in 1813. After having fought against Dom Miguel in Portugal, Guyon entered the Austrian service in 1832; and on being attached as aid-de-camp to Baron Splényi, married the daughter of that general in 1838. From that time till the outbreak of the revolution, Guyon led the life of a country gentleman on his estates near Comorn, but was one among the first to offer his services to the national government, and acted a prominent part in the struggle for independence. During the retreat of Görgei's army, Guyon carried the mountain-pass of Branyiszko, and by that daring feat of his re-established the communication with the government of Debreczin, as also with the several other Hungarian army corps. When, in April, 1849, the garrison of the besieged fortress Comorn was to be apprised of the victorous approach of the national army, Guyon, with a detachment of hussars, cut his way through the enemy's lines, and announced the approaching relief. The bloody affair of Szöreg allowed Dembinski, protected by the self-sacrificing ten battalions of Guyon, to retire to Temesvár, where the last battle of the Hungarians was fought and lost on Aug. 9. Guyon escaped to Turkey, and entered the service of the sultan, without being obliged to turn Mohammedan. Under the name of Kourshid Pasha, he, as a general of division, was governor of Damascus, and at the beginning of the Crimean war, did much to organize the army of Kars. He died at Constantinople in 1856. Indomitable courage, and an incessant care for the comfort of the troops under his command, were the chief features in Guyon's character.

GUYOT, ARNOLD HENRY, PH.D., LL.D.; b. in Switzerland, 1807; educated at Neufchatel, Stuttgart, Carlsruhe, and the university of Berlin. At Carlsruhe was established the friendship with Agassiz, which influenced his whole subsequent career. He studied theology, but his natural taste and associations led him to devote himself to physical science. In 1835 he took the degree of PH.D. in the university of Berlin, and proceeded to Paris, where he spent five years in severe study, making scientific tours during the summers in France, Belgium, Holland, and Italy. His investigations at this time and subsequently, in relation to glaciers, were of great interest and importance. From 1839 to 1848 he was professor of history and physical geography in the academy or university of Neufchatel. In 1848 a political revolution broke up the academy, and Agassiz, who had already emigrated to the United States, induced Guyot to follow him thither. He resided for several years at Cambridge, Massachusetts. In the winter of 1848–9 he delivered a course of lectures in French, on *The Relations between Physical Geography and History*, at Boston, which was translated by prof. Felton, and published under the title of *The Earth and Man*. He was next employed by the Massachusetts board of education to instruct the teachers in normal schools and teachers' institute in the best method of teaching geography; and subsequently by the Smithsonian institution to investigate the physical structure and elevation of the Alleghany system of mountains. In 1855 he was appointed professor of physical geography in the college of New Jersey. Besides delivering courses of scientific lectures, and contributing to periodicals, he has published a series of geographical works, including *Primary Geography*, *Intermediate Geography*, and *Physical Geography*, with a set of large wall maps. With president Barnard of Columbia college, he edited Johnson's *Universal Cyclopædia*. Guyot was the first to show the precise height of Mt. Washington, of the Green mountains, and of the Black mountains in North Carolina. Among his works are *Cosmogony of the Bible*, *The Unity of the System of Life*, *the true Foundation of the Classification of Plants and Animals*, and *Man Primeval*, all in the form of lectures, but subsequently published.

GUYSBOROUGH, a co. in n.e. Nova Scotia bordering on the Atlantic; 1656 sq.m.; pop. '71, 16,555. The sea-coast is rough and barren, but there is some tillable land in the interior. Gold mining has been followed with some success, but the extensive fisheries are the main source of prosperity. The chief town has the same name.

GUY'S HOSPITAL, founded by Thomas Guy, who leased from the governors of St. Thomas's hospital, a large piece of ground, for a term of 999 years, at a groundrent of £30 a year. The space being cleared, the first stone of the building was laid in 1722, and the hospital admitted its first patient in 1725, a few days after the death of its founder. The whole expense was £18,796, 16*s*., great part of which Guy expended in his lifetime, and he bequeathed £219,499 to endow it. Soon after his death, an act of parliament was obtained, regulating the management of the institution. In 1829 Mr. Hunt bequeathed to the hospital £190,000, and additional bequests to the amount of £10,000 have since been received. There was at first room for about 400 patients; now 700 can be accommodated. The yearly average of patients is over 3,000; the out-patients relieved may amount to 50,000. The annual income is about £40,000, chiefly from estates in the counties of Essex, Hereford, and Lincoln. The usual number of governors is 60, who are self-elective. Students enter the hospital for study, attending chemical practice, lectures, etc., and paying annual fees. The building consists of

two quadrangles, united by a cross structure or arcade, besides two wings extending from the front to the street—west wing built with elegance and uniformity, and whole edifice handsome and regular. A library and valuable museums are attached to the hospital. New wards, with tall towers for ventilation, were built in 1852, and a chemical laboratory in 1872. In the chapel is a fine marble statue of Guy, by Bacon, which cost £1,000. Sir Astley Cooper, the eminent surgeon, is buried in the chapel.

GUYTON DE MORVEAU, Louis Bernard, 1737–1816; b. France. When a youth he was made deputy attorney-general in the parliament of his native city (Dijon), but his inclination was to science, and he soon mastered enough of chemistry to take a professorship. In 1773 he made known the value of chlorine as a disinfectant. In 1782 he proposed a new chemical nomenclature which met the approval of Lavoisier and other learned scientists, and with their assistance brought it to the form which it still retains. For the *Encyclopedie Methodique* Guyton wrote a *Dictionary of Chemistry*. He was a member of the legislative assembly, and of the convention, where he voted for the execution of Louis XVI. From 1800 to 1814 he was at the head of the French mint, where he did much to promote the use of the decimal system.

GUZEL-HISSAR. See Aidhn.

GUZERÁT, a British district in the Punjab, India, 2,029 sq.m.; pop. '68, 616,347. It comprises a narrow wedge of sub-Himalayan plain country, possessing few natural advantages. From the basin of the Chenáb on the s., the general level rises rapidly towards the interior, which, owing to the distance of water beneath the surface, assumes a dreary and desert aspect. A range of low hills, known as the Pabbi, traverses the northern angle of Guzerát. They are composed of a friable tertiary sandstone and conglomerate totally destitute of vegetation, and presenting to the view a mere barren chaos of naked rock, deeply scored with precipitous ravines. Immediately below the Pabbi stretches a high plateau, terminating abruptly in precipitous bluff some 200 ft. in height. At the foot of this plateau is a plain, which forms the actual valley of Chenáb, and participates in the irrigation from the river bed. The district, as a whole, is well wooded, and great attention has been paid to arboriculture. Numerous relics of antiquity stud the surface of Guzerát district. Mounds of ancient construction yield numbers of early coins, and bricks are found whose size and type prove them to belong to the prehistoric period of Hindu architecture. A mound now occupied by the village of Moga or Mong has been identified as the site of Nicæa, the city built by Alexander the great on the field of his victory over Porus. The Delhi empire established its authority in this district under Bahloh Lodi, 1450–88. A century later it was visited by Akbar, who founded Guzerát as the seat of government. During the decay of the Mughal power, the Ghakkars of Rawal Pindi overran this portion of the Punjab, and established themselves in Guzerát about 1741. Meanwhile the Sikh power had been asserting itself in the eastern Punjab, and in 1765 the Ghakkar chief was defeated by Sardar Gújar Sinh, chief of the Bhangi confederacy. On his death his son succeeded him, but after a few months' warfare, in 1798 he submitted himself as vassal to the maháráját Ranjít Sinh. In 1864 Guzerát first came under the supervision of British officials. Two years later the district became the theater for the important engagements which decided the events of the second Sikh war. After several bloody battles in which the British were unsuccessful, the Sikh power was irretrievably broken at the engagement which took place at Guzerát on Feb. 22, 1849. The Punjab lay at the feet of the conquerors, and passed by annexation under British rule.

GU'ZERAT, or Gujerat, a geographical division of India, stretches in n. lat. from 20° to 24° 45′, and in e. long. from 69° to 74° 20′, containing about 42,000 sq.m. and about 3,000,000 inhabitants. Its most important section, perhaps, is the peninsula of Kattywar, which projects into the Arabian sea between the gulf of Cutch on the n.w. and the gulf of Cambay on the south-east. Of the mainland, a considerable portion is shut out from the sea by the British districts of Broach and Surat, so that the peninsula comprises nearly the whole of the coast-line and most of the available harbors. With regard, however, to internal communications, the mainland has the advantage of the peninsula, being traversed, to say nothing of streams of inferior magnitude, by the Nerbudda and the Tapti. To the s. of the last-mentioned river, Guzerat presents the northern extremity of the Western Ghauts. The products are rice, wheat, barley, sugar, tobacco, castor-oil, maize, opium, cotton, and fruits. Within the limits of Guzerat (also spelled *Gujarat* or *Gujerat*) lie the Guicowar's territory, and the numerous petty states of Kattywar, Mahi Kanta, and Rewa Kanta. The name Guzerat often includes also the British administrative division under the governor of Bombay, which comprises the districts of Surat, Broach, Kaira, Punch Mehals, and Ahmedabad.

GUZERAT', or Gujaret, a walled t. of the Punjab, stands on the right side of the Chenab, and is a place of some military and political importance, being on the great route between Attock and Lahore. Here, in 1849, a Sikh army of 60,000 men was utterly defeated by a much less numerous British force. Pop. '68, 15,907.—For the territory called Guzerat, see under that heading.

GWALIOR, the state above mentioned, with a remarkably irregular outline, and an area of only 33,119 sq.m., stretches in n. lat. from 21° 8′ to 26° 50′, and in e. long. from 74° 45′ to 79° 21′. Lying partly in the basin of the Jumna and partly in the basins of the Nerbudda and the Tapti, it divides its drainage between the bay of Bengal and the Arabian sea. It has been roughly estimated to contain about 3¼ millions of inhabitants. Though Gwalior is a Mahratta principality, being in fact, the principal fragment of the great empire of the Peishwa, yet it is only to the s. of the Nerbudda that the Mahrattas form any considerable proportion of the people. Under such circumstances, therefore, the dominant race can maintain its supremacy by force alone. Since 1803, the country has been under British protection. The existing relations of the two parties, however, date only from 1844. In 1843 the death of the sovereign, by producing universal anarchy, led to the forcible interposition of the British government; and by the treaty of the following Jan., in addition to a large contingent under British authority, the native government was permitted to have 9,000 troops of its own. During the troubles of 1857, the new Maharajah, not more than 22 years old, remained faithful to the English, notwithstanding the almost entire defection of both divisions of the military force.

GWA'LIOR, the capital of the state of the same name in central India, stands near the n.e. extremity of its straggling territory, and has a pop. of about 50,000. Its nucleus is an isolated rock of about 300 ft. in height, perpendicular, either naturally or artificially, on all sides; and as it measures 1½ m. by 300 yds., it can accommodate a garrison of 15,000 men. It is thus virtually impregnable against any native force. The spot is understood to have been occupied as a stronghold for more than a thousand years, and the summit has been provided, from time to time, with several spacious tanks. Along the eastern base of this eminence lies the town of Gwalior, containing little worthy of notice but a beautiful mausoleum of white sandstone; and to the s.w. there extends for several miles the Lashkar, or camp of the Maharajah's own army, while to the n.e. is the Moorar, or cantonment of the protecting contingent. During the troubles of 1857 and 1858, the place attained an unenviable notoriety as a center of rebellion, having, notwithstanding the fidelity of the Maharajah himself, been, for rather more than a year, in the power of the insurgents.

GWIN, William McKendry, b. Tenn. 1805; educated at Transylvania university, and practiced medicine in Mississippi. He was a member of congress in 1841. In 1848 he went with the gold-hunters to California, and in 1850 came back as U. S. senator. Early in the war of the rebellion his disloyalty was so conspicuous that he was sent to prison. After the war he lived for a time in northern Mexico.

GWINNETT, a co. in n. Georgia, on the Chattahoochee river, intersected by the Atlantic and Richmond air line railroad; 520 sq.m.; pop. '70, 12,431—2,159 colored. The surface is rough and mostly covered with forests. Much of the soil is fertile, producing cotton, corn, wheat, etc. There are also mines of gold, antimony, and iron. Co. seat, Lawrenceville.

GWINNETT, Button, 1732–77; b. England, and came to America in 1770. He became an extensive planter in Georgia, and was an early supporter of colonial rights. He was a member of congress, and president of the Georgia provincial council. In consequence of a quarrel about military matters he had a duel with gen. McIntosh, in which he was mortally wounded. Gwinnett was one of the signers of the declaration of independence.

GWY'NIAD, *Coregonus pennanti,* one of the British species of *coregonus* (q.v.) which, from their form, the large size of their scales, and their silvery appearance, are sometimes called *freshwater herring,* and are vulgarly identified with the herring. The general similarity is in this case very great. The gwyniad, when full grown, is about 10 or 12 in. in length; the first dorsal fin is high; the snout is a little produced; the mouth is small, the jaws without teeth, a few minute teeth on the tongue only. It is found in some of the lakes of Wales and Cumberland. Gwyniad is a Welsh name. At Ullswater, the fish is called *schelly.* It occurs in that lake in great shoals, so that many hundreds are sometimes taken at a single draught of the net. It is rather an insipid fish, and cannot be kept long after being taken out of the water, unless salted, which it often is by the poor. The freshwater herring of Loch Lomond is not the gwyniad, but the powan. Many of the species of this genus, however, very nearly resemble each other, and are not easily distinguished by mere description.

GWYNN, or GWINN, Eleanor, or Nell, 1650–90; a girl born in poverty, who sold fruit and flowers, and sang songs around the taverns and playhouses of London. About 1666 she went on the stage, and in light and humorous plays became one of the most successful actresses of the time. Having been mistress to Lord Buckhurst, she passed from him to Charles II., who had no scruple about acknowledging her, and she remained with him as long as he lived, keeping an establishment of her own, and having free admission to the best society. She was the only one of the king's favorites who remained true to him. A son of her's by the king became duke of St. Albans. After Charles's death she led a quiet and respectable life.

GYARMAT'-BALAS'SA, or BALASSA-GYARMAT, a t. of Hungary, in the co. of Neograd, 42 m. n. by e. from Pesth, on the left bank of the Eipel or Ipoly. The surrounding district is very beautiful and fertile, producing much excellent wheat. Near the town are the ruins of a castle, once belonging to the Balassa family, and famous as having been oftener than once heroically defended against the Turks. Pop. '69, 6,435.

GYAROS, one of the Cyclades islands of the Grecian archipelago, 10 m. n.w. of Syra. It is about 5 by 3 m., and mountainous. It was once the residence of persons banished from Rome.

GYBING, or JIBING, in sailing with fore-and-aft sails, the act of shifting over the boom, when the wind is astern or at any point abaft the beam, so that the wind may be brought to bear on the sail on the reverse side of the vessel to that in which it was felt previously to the operation. With a change of wind or course, the boom and its sail are *gybed* to the other side of the vessel.

GY'GES, a Lydian, about whose early life little is known. Nyssia, wife of Candaules, king of Lydia, having been grievously affronted by her husband in presence of Gyges, ordered the latter, who was in high favor with his sovereign, either to slay Candaules or to prepare for his own fate. (Compare the history of Rosamund, wife of Alboin, king of the Lombards; Gibbon, vol. v. p. 339, Murray's ed.) Gyges accordingly put his master to death, married Nyssia, and assumed the supreme power, about 716 B.C. The Lydians, however, refused to acknowledge his authority, until the oracle of Delphi declared in his favor. In return for this service, he made immense presents to the sacred shrine. He is said to have reigned 38 years, and to have amassed enormous wealth, so as to give origin to the proverb, "the riches of Gyges." The successors of Gyges were Ardys, Sadyattes, Alyattes, and Crœsus, who was defeated by Cyrus the great in 546 B.C. (or 548). The Lydian empire was thus overthrown. Plato has a fable, in which Gyges is represented as a shepherd of Candaules; but having miraculously obtained possession of a golden ring of great virtue, he was enabled by means of it to make himself invisible when he chose, and thus took occasion to murder his sovereign, and usurp the supreme power. The ring of Gyges is frequently mentioned in the middle ages.—GYGES is also the name of the hundred-handed giant, son of Cœlus and Terra, who with his brothers made war on the gods, and after his overthrow, was subjected to everlasting punishment in Tartarus.

GYLLEMBOURG-EHRENSVÄRD, THOMASINE KRISTINE, baroness, 1773–1856, the most eminent female writer of Denmark. Her great beauty early attracted notice, and before she was seventeen she married the political writer Peter Andreas Heiberg. To him she bore a son, afterwards illustrious as a poet and critic, Johan Ludvig Heiberg. In 1800 her husband was exiled and she obtained a divorce, marrying, in 1801, the Swedish baron Ehrensvard, himself a political fugitive. Her second husband, who presently adopted the name of Gyllembourg, died in 1815. In 1822 she followed her son to Kiel, where he was appointed professor, and in 1825 she returned with him to Copenhagen. In 1827 she first appeared as an author by publishing her romance of *The Polonius Family* in her son's newspaper, *The Flying Post*. In 1828 the same journal contained *The Magic Ring*, which was immediately followed by *An Everyday Story*. The success of this anonymous work was so great that the author adopted until the end of her career the name of *The Author of an Everyday Story*. From this time forward she took a foremost place among the writers of her time, but preserved her incognito with entire success. In 1833–34 she published three volumes of *Old and New Novels*. *New Stories* followed in 1835 and 1836. In 1839 appeared two novels, *Montanus the Younger* and *Ricida;* in 1840 *One in All;* in 1841 *Near and Far;* in 1843 *A Correspondence;* in 1844 *The Cross Ways;* in 1845 *Two Generations*. From 1849 to 1851 the baroness was engaged in bringing out a library edition of her collected works in 12 volumes. She died in her son's house at Copenhagen, and not until then did the secret of her authorship transpire; for throughout her life she had preserved the closest reticence on the subject, even with her nearest friends. The style of Mme. Ehrensvard-Gyllembourg is clear and sparking; for English readers no closer analogy can be found than between her and Mrs. Gaskell, and *Cranford* might well have been written by the witty Danish author. She introduced into the literature of her country a novel vein of realism and domestic humor, and, although she has had many imitators, she is still without a rival.

GYMNA'SIUM. This word (from *gymnos*, naked) was applied to those public places or buildings where the Greek youths exercised themselves. In Athens alone there were seven resorts of this kind. Philosophers also gave instruction in these *gymnasia*, hence the transference of the name to public buildings erected for the mental disciplining and instruction of youth. The German gymnasium corresponds roughly to the grammar and public schools of England, and the grammar and high schools of Scotland. All three had their origin in the cathedral and monastery schools of the pre-reformation period. The widening circle of human knowledge in the 17th and 18th centuries made itself felt in these educational seminaries, as in the universities. Their curriculum became gradually extended, and with the further increase and development of univer-

sities, their aims became higher. In Germany, as in this country, the classical tongues formed and continue to form the great instrument of mental discipline in schools of this higher class, though other subjects have been added from time to time. The subjects of instruction which were first added to the classical tongues were geography and history. The natural sciences and mathematics, the pursuit of which has formed a characteristic feature of this century, gradually found a place in the schoolroom ; and the study of the mother-tongue and of modern languages was also admitted. For a time, these subjects held a co-ordinate place with Latin and Greek. Departmental studies were taught with ardor, and educators were sanguine of the results which would flow from early initiation into the results and processes of the various sciences. These anticipations having been somewhat disappointed, there has for some time been a steady movement towards the restoration of classical or humanistic studies to be the main instrument of education, while retaining other subjects as a subordinate portion of the curriculum. The idea, however, of the gymnasium as specially a preparatory school for the university, and therefore not suited to all classes indiscriminately, has been more steadily kept in view in Germany than in Great Britain, and the consequence has been the breaking up of the middle school or gymnasium into two—the gymnasium proper, where those are taught who propose to enter the universities, or who desire a partial classical training ; and real-schools where elementary science, foreign languages, and mathematics form the principal subjects of instruction. In this respect, the middle-school education of Germany affords a favorable contrast to that of England. It is not to be supposed, however, that in England the grammar and public schools are less efficient in their classical training ; the contrary is probably the fact, so far as our principal schools, such as Eton, Harrow, and Rugby, are concerned ; but the methodized system of examinations, and the more rigorous methods of Germany, seem to turn out a larger *proporiton* of well-instructed boys from each school, while the influence of central authority secures greater uniformity of processes and results throughout the country. The boys attend, as in England, till they reach the age of 18, when, after a special examination (the abiturient or maturity examination), they are transferred to the university. The German gymnasiums differ from English public schools for the middle and higher classes in being day-schools, and not the center of great boarding establishments. In this respect they resemble the Scotch grammar and high schools.

GYMNAS'TICS (see GYMNASIUM), a term, in its more restricted and proper sense, applied to those exercises, not amounting in intricacy to games, by which particular limbs, either singly or in combination, are rendered more pliant or stronger ; these exercises are arranged in a due progression, and the entire series becomes a system under the name gymnastics. Swimming (q.v.), boating, and games like golf (q.v.), cricket (q.v.), etc., are among the most efficient gymnastic exercises ; but in this article attention will be confined to exercises whose primary and direct aim is muscular development and health.

Gymnastic games are so old as to be pre-historic ; they are alluded to in the 2d and 23d books of the *Iliad*. Before the time of Hippocrates, gymnastic exercises had been adopted in Greece as part of the course of medicine intended to counteract increasing luxury and indolence. The various exercises were speedily combined into a system, and gymnasia, where they should be carried out, were formed first by the Lacedæmonians, and subsequently at Athens. See GYMNASIUM. The Romans adopted the system, and constructed gymnasia on a magnificent scale. Many of their buildings, having had extensive baths attached, were known as *Thermæ*. The exercises in the gymnasia consisted of running, leaping, dancing, wrestling, boxing, hurling, etc. ; and in those days, when all men bore arms, and when, in close combat, victory went generally with the strongest man, these games were doubtless of great value. In subsequent ages of knightly prowess, similar exercises were probably practiced, though less publicly ; but with the introduction of gunpowder, and through its means, the gradual substitution of fighting at a distance—in which science and skill were the main requisites—for personal encounters where strength and muscle went far to carry the day, the attention paid to gymnastics decreased, and finally vanished altogether. To make infantry soldiers perfect in the drilled movements of masses, cavalry good horsemen and fair swordsmen, and to have gunners who could take an accurate aim, became the utmost sought by the possessors of great armies ; while the science of gymnastics, having gone out of repute for the military, was speedily neglected in merely civil life. It is only from the earlier portion of the present century that the science has at all revived.

The revival commenced in Prussia, where, about 1806, gymnasia were opened by Basedow and Salzmann, that of the latter being under the superintendence of the celebrated gymnastic pedagogue Guts Muths (q.v.); Jahn followed in the same line, and rendered the science so popular that it speedily attracted the attention of the youth throughout the kingdom, and to the training thus obtained must be attributed, in no small degree, the vigor which succeeded in driving out the French army of the first empire. Sweden soon imitated Prussia, and from that time gymnastics have formed a prominent feature in the Scandinavian course of education. In Prussia, the gymnasia began to be the scenes of political gatherings, too liberal in tendency to please its semi-

military government; and in 1818 they were all closed. The troops were, however, continued in gymnastic exercises, and showed so clearly the advantages of the training experienced, that, about 1844, Louis Philippe adopted and improved the system in the French army. From that time, gymnasia have been constructed for almost all continental armies, and, with more or less success, for the civil population. England, last ordinarily in public improvements, only moved in the matter a few years ago by establishing instruction in the science at Aldershot and other camps; in private life, however, there have long been many excellent gymnasia.

Different instructors adopt various systems of instruction. The course passed through in the French army is, however, one among the best, as its fruits evince, in the remarkable activity and readiness for emergency displayed by the soldiers who have undergone it. The equipment consists of a broad belt, to be strapped tightly round the waist above the hips, as a support to the body in the arduous motions to ensue, braces being of course discarded. The implements most commonly required are an iron ball in a rope-sling, with a loop for the hand to pass through; wrestling-handles, consisting of two wooden bars, each about 18 in. long, connected by stout cordage; a club; leaping bars, to be leaped over; and leaping-poles wherewith to leap.

The system of instruction is divided into a number of "courses" regularly graduated, beginning with elementary and special movements, with a view to render every part of the body supple, and to develop the several muscles and give complete command over all their motions (*elementary gymnastics*); and proceeding to exercises of leaping, suspension, standing and walking on beams, walking on stilts, climbing, swinging, vaulting, etc. (*applied gymnastics*).

The theory of the advantage derivable from gymnastics is simple enough. An admirable law of nature provides that—within certain limits—parts of the human frame increase in strength, aptitude, and size, in proportion to the use made of them. In gymnastics, this law is brought to bear successively on every part, and finally on the whole system in combined action. If the exertion be not carried so far as to induce excessive fatigue, all other parts of the body sympathize with the improving condition of that which is mainly exerted; the circulation, excited from time to time by the exercise, acquires fresh vigor, and blood being driven with unwonted force into all parts of the system, every function is carried on with increased activity; an improvement in the general health becomes soon manifest, and the mind—if simultaneously cultivated with judgment—increases in power and endurance.

Gymnastic exercises require, however, to be practiced with many precautions, and always with moderation and due regard to the strength of the individual. The whole benefit may be counteracted by excess; the muscles may be overstrained, and ruptures and other serious accidents ensue. The danger of such evils from gymnastic exercises has perhaps been exaggerated, and it has no doubt hindered their more extensive introduction into schools. But it is to be remembered that hardihood can in no way be obtained without risk; for cricket, fencing, boating, and other manly sports, are attended with at least as much danger as a well-regulated course of gymnastics.

A short account of gymnastics and out-of-door recreations is given in *Chambers's Information for the People*, vol. ii. Other works on the subject are—Capt. Chiasso's *Gymnastics and Calisthenics;* G. Roland's *Gymnastics;* Walker's *British Manly Exercises;* and MacLaren's *Training, in Theory and Practice;* and *Physical Education, Theoretical and Practical* (1868). The books written in German on Gymnastics (Turnkunst) would form a small library.

GYMNE'MA. See COW PLANT.

GYMNE'TRUS, a genus of acanthopterous fishes of the ribbon-fish (q.v.) family, having the body much elongated, and at the same time attenuated and compressed, the dorsal fin extending the whole length of the back, the ventral fins consisting only of a single long ray, often dilated at the end; the mouth small. The fishes of this genus are inhabitants of great depths, and are rarely taken or thrown ashore. *G. remiceps* is a native of northern seas; *G. hawkenii* has occurred on the coast of Britain; other species are tropical. It has been supposed that large fishes of this genus may have given rise to some of the stories of the great sea serpent. One was lately captured at the Bermudas, apparently an immature fish, but more than 16 ft. in length, and with a row of long flexile filaments on the back of the head and anterior part of the back, which might well represent the mane often ascribed to the sea serpent. A specimen of *G. hawkenii*, caught on the coast of Northumberland, was exhibited in London at the time when the subject of the great sea serpent excited greatest interest, and was by many supposed to explain the accounts of it.

GYMNO'CLADUS, a genus of trees of the natural order *leguminosæ*, sub-order *cæsalpiniæ*.—Gymnocladus *Canadensis* is a North American tree, found both in Canada and over a great part of the United States, attaining a height of 50 to 60 ft., with branches remarkable for their upright direction, and an exceedingly rough bark which comes off in slips. The leaves of young trees are very large, 3 ft. long, bipinnate. The flowers are white in short spikes. The pods are 5 in. long by 2 broad. The tree is called *chicot* in Canada, and sometimes *stump tree*, from its dead appearance in winter, and the

absence of conspicuous buds. It is also called the *Kentucky coffee tree*, because the seeds were formerly roasted and ground as coffee in Kentucky. It grows well in Britain. The wood is used both by cabinet-makers and by carpenters. It has very little sap-wood. The pods, preserved like those of the tamarind, are said to be wholesome and slightly aperient.

GYMNODON'TES, Cuvier's genus of salt-water sun-fishes or globe-fishes (Linnæan, genus *diodon*), belonging to sub-order (Cuvier's order) PLECTOGNATHI, of the order of TELEOST fishes, which also includes the living trunk fishes and file fishes. They are noticeable for their resemblance to true ganoid fishes from their partly ossified endoskeleton and ganoid scales. See DIODON, *ante*.

GYM'NOGENS, in the botanical system of Lindley, are those plants with exogenous stems and perfectly naked seeds. He forms of them a separate class, of which *coniferæ, taxaceæ, cycadaceæ,* and *gnetaceæ* are the orders. They are remarkable for the large apparent perforation or disks in the vessels of the wood, but they have concentric zones, spiral vessels, and a central pith, like other exogenous plants. Their great peculiarities, however, are the total absence of a pericarp, and that fertilization takes place directly through the foramen of the ovule, without the intervention of style or stigma.

GYMNONOTI. See GYMNOTUS, *ante*.

GYMNOSO'MATA (Gr. naked-bodied), an order of pteropodus (q.v.) mollusks, destitute of shell, having a distinct head, and swimming by fins attached to the sides of the neck. They are all marine. The *clio borealis* of the arctic seas (see CLIO) is the best known and most interesting example.

GYMNOSO'PHISTS (i.e., "naked sages") the name given by the Greeks to those ancient Hindu philosophers who lived solitarily in the woods, wore little or no clothing, and addicted themselves to mystical contemplation and the practice of the most rigorous ascetism. Strabo divides them into Brahmans and Samans, the former of whom adhered to the strictest principles of *caste*, while the latter admitted any one into their number regarding whose character and kindred they were satisfied.

GYMNOSPERMS. See GYMNOGENS, *ante*.

GYMNO'TUS, a genus of malacopterous fishes, of which only one species is known, the celebrated *G. electricus*, or electrical eel. This genus gives its name to a family, *gymnotideæ*, of which, however, no other known species has any electrical powers. The *gymnotidæ* are mostly South American, inhabiting the fresh waters of the tropical regions. They are eel-like in form, and like eels are destitute of ventral fins (*apodal*), but they are furnished with complete jaws and with ribs, and their fin-rays are jointed or branched. They have pectoral fins, but no dorsal; the anal fin is largely developed, extending either to the point of the tail, as in the electrical eel, or leaving it free. The electrical eel has the skin entirely soft, and destitute of scales. It is very widely diffused over the warm parts of America, and is found both in streams and pools. Its electrical apparatus and powers are described in the article ELECTRICITY, ANIMAL. It is capable of being tamed, and when familiar, will allow itself to be handled without giving a shock, but employs its electrical powers both in order to kill prey and to defend itself from assailants, most frequently, perhaps, alligators. All the *gymnotidæ* are remarkable for the position of the anus, which is so very far forward as in the electrical eel to be before the gill-openings, whilst in some of the other fishes of this family it is even before the eyes. Some fishes of this family have an elongated snout. The electrical eel, however, has a rounder and more obtuse nose than the common eel.

GYNÆCEUM, the department for women in ancient Greek houses, where they were employed in various domestic occupations. It was always the innermost room. In Rome there was a gynæceum in which women were employed in making furniture and clothing for the imperial families.

GYNE'RIUM. See PAMPAS GRASS.

GYO'MA, a t. of Hungary, in the co. of Bekes, 89 m. s.e. by e. from Pesth, and on the railway between Pesth and Temeswar. It stands in a plain on the bank of the Körös, which is here crossed by a bridge. There is a Protestant church. Pop. '69, 9,907.

GYÖNGYÖS, a t. of Hungary, in the co. of Heves, is situated at the southern base of the Matra mountains, about 50 m. n.e. of Pesth. The last declivities of the Matra mountains produce an excellent red wine called by the Germans Erlauer, and very like Burgundy, for which, indeed, it is often mistaken. Gyöngyös has a gymnasium, manufactures woolen fabrics, and carries on trade in wine and fruit. Pop. '69, 15,830.

GYPAE'TOS. See LÄMMERGEIER.

GYPSIES (Egyptians), [Fr. *Bohémians*; Germ. *Zigeuner;* Dutch, *Heathens;* Dan. and Swed. *Tatars;* Ital. *Zingani;* Span. *Gitanos, Zincali;* Hung. *Czijányok, Pharaonepek;* Pers. *Sisech;* Hindu, *Karachee;* Arab. *Harami;* Gyps. *Rom* (man), *Sinte* (from Ind), *Calo* (black); nicknamed in Fr. *Cajoux, Geux;* Germ. *Zieh-Gauner,* etc.], a mysterious

vagabond race, scattered over the whole of Europe and parts of Asia and Africa. Whence they originally came, and what were the motives which drove them from their native soil, are questions which, after having passed through a long stage of helplessly absurd speculation, have of late years been ventilated by competent investigators, both linguists and historians, and are still but partially solved. So much only seems now established, that India, the cradle of many nations, was also the source from which they sprang. Whether, however, they are the Tshandalas of which the laws of Menou speak, or the kinsmen of the Bazeegars or Nuts of Calcutta; whether they belong to the Tshingani, a band of robbers near the mouth of the Indus, or are the descendants of those Luris—identical, according to Persian and Arabic authorities, with the Zuts or Djatts of northern India—whom Firdusi mentions as having been called into Persia by Bahram Gur to the number of 10,000, about 420 A.D., that they might act as musicians to the poor—cannot be affirmed with certainty, although there can be no doubt that theirs must have been at all times one of the poorest and most obscure tribes of India. The first considerable body left Asia for Europe before the 12th c., perhaps in consequence of disastrous encounters with the Arabian conquerors; and Tamerlane was unquestionably the cause of still more numerous emigrations in the 14th century. The first notice of them which occurs in European literature is embodied in a free paraphrase, in German, of the book of Genesis, written by an Austrian monk about 1122. They are there described as "Ishmaelites* and brasiers, who go peddling through the wide world, having neither house nor home, cheating the people with their tricks, and deceiving mankind, but not openly." Two hundred years later, we find them settled in Hungary (under Belus II.), at Cyprus, and in Wallachia. In 1417 they traveled in great hordes into Moldavia and many parts of Germany. In 1418, five months after the council of Constance, they appeared, about 1000 strong, before Zürich, commanded by a duke Michael "of Little Egypt," accompanied by several dukes and knights, and carrying with them a good supply of money, sporting-dogs, and other "marks of nobility." From Switzerland they descended into Italy, and in 1422 they showed themselves at Bologne and Forli. Another band, numbering, this time, according to the old Swiss historian, Stumpf, 14,000, arrived in the same year at Basel. On Aug. 17, 1427, a band of them, coming from Bohemia, made their appearance before Paris, which, however, they were not allowed to enter, but were lodged at La Chapelle Saint Denis. Other hordes succeeded these in the following years, spreading in rapid succession over all parts of Germany over Spain, England, Russia, Scandinavia, and, indeed, over the remotest parts of Europe. The account which they most frequently gave of themselves was, that they originally came from "Little Egypt;" that the king of Hungary had compelled about 4,000 of them to be baptized, had slain the remainder, and had condemned the baptized to seven years' wandering. Another version of their story was, that the Saracens had gone to war with them in Egypt, had subdued them, and forced them to renounce Christianity; that, after some years, they had been reconquered by the Christians, and that the pope, Martin V., had laid upon them, as a penance for the renunciation of the true faith, a life of wandering for the space of seven years, during which they were not to sleep in a bed. At the end of this period, they would be sent to a fine and fertile land. Yet another account was, that they were commanded by God to roam through the world for that period, in expiation of their want of hospitality toward Joseph and Mary—a notion which has, curiously enough, been partly revived in our own day by Roberts, with this difference only, that he proves them, from the prophecies of Isaiah, Jeremiah, and Ezekiel, to be descendants of the ancient Egyptians, and their wanderings to be the predicted punishment of the various iniquities of their forefathers.

At first they were well received. The romance with which they surrounded themselves, their pretended state of penitence, above all, the pomp and wealth they displayed, were sufficient to secure the good-will of the countries through which they passed—so much so, that letters of safe-conduct were given them by the emperor Sigismund, the genuineness of which there is no reason to doubt. Soon, however, the tide began to turn. Their resources gone, they were everywhere treated with contumely, and despised chiefly on account of the degrading arts of chiromancy, magic, and thieving, to which they again resorted for their support, like their earlier brethren, described by the monk. And with the reckless brutality characteristic of the middle ages, edict after edict was hurled against these "diviners and wicked heathens." The governments of Europe vied with each other in banishing, outlawing, and slaying them whenever and wherever found, and in most severely punishing those that dared to shelter them, chiefly "because of their traffic with the devil." These edicts remained in force in many countries down to the 18th c.; and Frederick the great, in 1748, renewed the law that every gypsy beyond the age of 18, found in his states, should be hanged forthwith. In England the most barbarous decrees against them were issued by Henry VIII. in 1531, and Elizabeth in 1563. In Scotland, where, under James V., a certain Johnny Faa had been officially recognized by the crown as lord and count of Little

* Ishmaelites—a notion perpetuated in the designation *Geschmeilim* of the Danish thieves' jargon, and the German *Rothwälsch* (Dorph, 44 and 45; Grolman, 65)—a term which has hitherto puzzled all investigators. Pott himself not excepted (cf. p. 28; Heister, p. 8), but which is nothing but a corruption of the Hebrew *Jishmaelim*—Ishmaelites.

Egypt, some of the severest edicts date from 1570, 1603, and 1609; and in 1624 Helen Faa, a descendant of Johnny, together with fifteen other women of the seed-royal, were condemned to be drowned. Towards the latter half of last century, however, more humane measures were adopted towards them, with a view to the improvement of their social and moral state. Maria Theresa, in 1768 and 1773 issued ordinances for the education of their children, and their gradual settlement as cultivators of the soil, chiefly in Hungary and Transylvania, where they swarmed in large numbers; special streets were built for them at the ends of the villages, and the name of Uj-Magyar, Uj-Parasztok (new peasants), was officially bestowed upon them. Joseph II. renewed these edicts in 1782 with certain modifications. Various other methods of gradually amalgamating them with the general population were tried elsewhere (a society was formed for that purpose at Southampton by the Rev. Mr. Crabb in 1832) but with comparatively little effect. They have continued—with few exceptions—their peculiar nomad life, with all its questionable resources and practices, its joys and its sorrows, unchanged, up to this day; and even gypsy children, brought up far from their tribe, in the midst of Christian families, have, driven by some mysterious and uncontrollable impulse, run away from their civilized homes as soon as a favorable opportunity offered.

Before proceeding to give a general outline of their present condition, we must briefly mention what have been the opinions held about them since the 15th c. by the learned. They have been, then, by turns set down as Egyptians, Nubians, Tartars, Cilicians, Mesopotamians, Assyrians, Ethiopians, Moors, Armenians, Manichæans, Banditti, and German Jews. More recently, they were, on account of the name of Zingari or Zingani—probably a corruption from their own name Sinte (from Ind), by which they are known in many countries of Europe—brought in connection with the Sigynnai, a people of Median origin, settled on the Danube, mentioned by Herodotus; with the Sigynni of Strabo, in the Caucasus; with the Usbecks, and a host of other tribes known and unknown. Again, their name has been derived from one Zinganeus, who, in 1517, when they had long been known as Zingani, fled with his followers to escape the vengeance of Selim. The now recognized theory of their Indian origin, proved incontestably by their language, was first positively advanced by Rüdiger in 1782; and in his track followed, with more or less success—collecting, comparing, or arranging new and old linguistic materials—Grellmann, Alter, Seetzen, Pottinger, Hoyland, Puchmayer, Ouseley, Danilowicz, Bischoff, Domeny de Rienzi, Graffunder, Richardson, bishop Heber, Pott (whose wonderfully exhaustive work on this subject made him the *facile princeps* of gypsologists), and more recently Paspati, Miklosich, Borrow, Leland, Smart, and Crofton. Bataillard wrote on the history of the gypsies without discussing specially their language.

This their language, then—a daughter of the old Sanscrit—has, besides giving the only real clue to their origin, also shed some rays over the dark period between their first emigration and their appearance in Europe. Originally the distinct mode of speech of a single and special border tribe of northern India, it has, during the many wanderings of the race, appropriated words from every country through which they passed; while, on the other hand, it lost many of its own words, and still more of its own inherent power and elegance, and much also of its resemblance to its mother and sisters. These adopted foreign words, their respective number, and their more or less corrupted state, point plainly to the gypsies having passed first into Persia, to their having remained there for a considerable time, to their having then wended their way to some Greek country, perhaps Asia Minor (the designations for 7, 8, and 9 being still Greek), and to their descent thence into Hungary, Cyprus, etc.

But their language also (Romany Tschib), though split into different dialects, has also remained almost the only tie which binds the widely-scattered nomad members together. Those of their branches who for centuries have had no intercourse with each other, would, although the strange elements in the other's speech would be incomprehensible to them, yet recognize each other at once by certain words and formulas indelibly written in the memory of the whole race. The outward appearance of the gypsies, who have been pronounced by competent writers to be one of the handsomest races of humanity, varies in some degree according to the climate under which they are born and in which they roam. Their chief characteristics, however, remain everywhere the same: tawniness of skin; slightly projecting, but agreeably formed cheek-bones; long hair, of the color and luster of coal; large black eyes, exquisitely shaped mouths, ruddy lips, teeth of a dazzling whiteness, slenderness and agility of limb, expressive features, and well-proportioned, often elegant build. Their women are, indeed, exquisitely beautiful when young, but they lose their good-looks at a very early period, partly on account of the squalor of their habits, and partly from their unsettled and precarious life. Like children, they are fond of showy colors in dress, and do not disdain to adorn themselves with even dubious trinkets and fine garments in a forward state of decay; but they always arrange their clothes, however poor, with great taste. Of their other qualities, their manners and customs, we can only say that they were, and still are, supposed to be cowardly, revengeful, and treacherous; that they allow themselves to be used as spies; are the associates of robbers and thieves; and that their women, chaste themselves, ply all sorts of questionable trades, chiefly selling poisons, and acting as go-betweens. It is further said that their language has no word for God,

immortality, soul—that, in fact, they have no religion whatever; that their marriages, contracted very early, are not binding; that they were, or are, wont to eat their parents; and that they are altogether a very criminal race. How much of all these charges is more founded on fact than their intercourse with demons, for which they have been so dastardly slaughtered in former days, we are not able to decide; certain it is, however, that their ethical code differs most essentially from that of other people (Gorgio), whom they despise on account of their childish credulity and brutal cruelty. They have proved themselves, on several occasions, bold and courageous as lions, but they prefer running away to fighting the battles of the foreigners; and it is also agreed on all hands, that they are passionately attached to their relations; that they are fatalists, and have a sort of fetichism or pantheism, though its peculiar form has never been revealed by them to any inquisitive tourist. At the same time, they belong outwardly to the religion of every country which they happen to inhabit, and repeat the process of baptism as often as they can, with a view, as some have it, to the presents of godfathers and godmothers. They believe in a metempsychosis or transmigration of souls, and refrain for that reason from eating certain animals (eels, etc.), although, generally, they are anything but choice in their food. They are dirty, lazy, fond of drinking and smoking. Their talent for music is remarkable in the extreme; their ears seize, and their instruments reproduce, after the first hearing, the most difficult and complicated pieces, even entire symphonies. Many famous artists (Kecskemecz, Bunks, etc.) have issued from their ranks; and their own melodies sounding over the wide Hungarian pushtas, the steppes of Russia, or through the streets of Jassy, are not easily forgotten. Some of them have indeed become the much-valued property of other nations, or are embodied in some of our favorite operas. No less wonderful is the grace and charm of their wild dances. Altogether, the gypsies are one of the most gifted races, the lost geniuses, so to say, of humanity. The real truth about them, their traditions, and religion, will we fear, be ever kept a secret. The statement of Borrow, who has lived so long among them, that their entire catechism is summed up in the three precepts: "Be true to your people—be faithful to your husbands—and never pay any debts except those owing to your own kindred," must, we fear, be received with the same degree of caution which, we are sorry to say, has to be applied to many other statements about their manners and customs contained in his othewise useful *Gypsies in Spain*. The incredibly absurd descriptions of the Jewish marriage-ceremonies, about which we do possess the fullest and most authoritative information, given there as a counterpart to those of the gypsies, show plainly how easily and abundantly his good-natured credulity must have been worked upon.

The increase of population, and the growth of culture all over Europe, are their worst enemies. Their forests are cut down, their heaths inclosed, the houses are pushed right into their commons; and the easy and remunerative belief in their secret arts is waning more and more. It is doubtful, indeed, whether they will, as a separate race, survive many more centuries in Europe. Their numbers at this moment are stated so very differently, that we would fain caution the reader against an implicit belief in the following figures, which we extract from the comparatively most reliable authorities: in Hungary, 140,000; in Transylvania and the principalities, 162,000; Spain, 40,000; England and Scotland, 18,000 (their chief families in these countries being the *royal* Lees, the Stanleys, Coopers, Hernes, Smiths, Lovells, etc.); Poland, 2,000; Russia, 10,000; Germany, France, and Italy, 40,000; Norway, 1500. Althogether, including those in Turkey and in Asia and Africa (their sojourn in Mexico is questionable), they are computed at about five millions (Rienzi). A small portion only of these occupies as a body fixed habitations in Hungary and Transylvania, where they are agriculturists and goldwashers; and in the principalities, where they live in a kind of serfdom, and are divided into four different classes—Rudari or Aurari (gold-seekers), Ursari (bear-leaders), Lingurari (manufacturers of and dealers in wooden spoons, mouse-traps, etc.); and Laïessi (masons, smiths, tinkers, etc.). All the rest lead a roaming life, live in kennels and under tents from one end of the year to the other, gaining their scanty livelihood, like their forefathers, as best they can, fearing and detesting nothing so much as a fixed and continuous occupation, which would take them away from "their free mountains, their plains and woods, the sun, the stars, and the winds."

The following is a specimen of their language in the form of a short improvised stanza:

Poraquel luchipen abajo
Abillela un balichoró,
Abillela á goli goli,
Ustilame Caloró.

There runs a swine down yonder hill,
As fast as e'er he can,
And as he runs, he crieth still;
Come steal me, gypsy man.

GYPSY-WORT, *Lycopus Europæus*, a perennial plant of the natural order *labiatæ*, with stem about 2 ft. high; opposite, ovato-lanceolate, scarcely stalked, almost pinnatifid, wrinkled leaves; and dense whorls of small whitish flowers with purple dots, the limb of the corolla 4-cleft and nearly equal; only two stamens perfect. It grows in ditches

and wet places, in Britain and on the continent of Europe. It is a febrifuge. The juice stains cloth a permanent black color, and gypsies are said to use it to give a dark hue to their skin, whence the English name gypsy-wort, and the French *herbe des Bohemiens.*

GYPSUM, a mineral consisting essentially of sulphate of lime and water, the proportions of its constituents being lime, 32.56; sulphuric acid, 46.51; water, 20.93. It is very widely diffused, occurs in great abundance in many parts of the world, and is found in rocks and strata geologically very different, as in transition rocks, in secondary and in tertiary formations. It often occurs in nests or kidney-shaped masses in clay or marl. It is found above chalk in many places, and large quantities of it are quarried in some parts of England from the red marl immediately above the great bed of rock-salt. It sometimes occurs in beds many feet thick. It is transparent or opaque, white, yellowish-white or gray, or even yellow, red, brown, or black, according to its purity of chemical composition or the quantity and nature of impurities present. It is also compact, fibrous, foliated, or earthy; sometimes crystallized in six-sided prisms or in lenses. Twin crystals are frequent. It is easily broken, scratched, and cut. Before the blowpipe, it becomes opaque, if not already so, and fuses into a white enamel. The water which it contains is driven off by a heat of about 272° F., and it is then easily reduced to powder, in which state it is well known as *plaster of Paris.* Unburned gypsum is tough, and not easily reduced to powder. Gypsum is soluble in cold water, to the extent of about one part in 461, and is a frequent ingredient in the water of springs; it is scarcely more soluble in boiling water or in acids. To this solubility in water, although so slight, must be ascribed the value of gypsum as a manure; the further chemical explanation of which, however, still remains to be ascertained, although theories have been proposed by sir Humphry Davy and by Liebig, the former supposing the gypsum to act chiefly by itself, becoming the nutriment of the crops to which it is most beneficially applied; the latter supposing it to act chiefly by fixing the ammonia of the atmosphere and conveying it to their roots. As a manure, gypsum is more extensively used in some parts of the continent of Europe and of North America than of Britain. In North America, it is reduced to a fine powder by mills, in order to be used as a manure, for much of its value depends on the fineness of trituration. To clover crops, the application of gypsum is particularly beneficial, and although it does not produce much benefit in its direct application to grain crops, yet in an alternation of wheat and clover, the crop of wheat is larger because of the liberal supply of this mineral manure to the clover. An excess of gypsum, however, is prejudicial, as has been found in some parts of England, where the subsoil containing it in great quantity has been rashly brought up by the plow.—Gypsum, deprived of its water by burning, and reduced to powder, forms a paste which almost immediately *sets*, or becomes firm and solid, when mixed with its own bulk of water; hence the great use of *plaster of Paris* for making casts and cornices. But if the gypsum is burned at too great a heat, it refuses to set, and the powder of the mineral called *anhydrite*, which is an anhydrous sulphate of lime, has not the property of setting.—One of the finest varieties of uncrystallized and untransparent gypsum is alabaster (q.v.).—*Satin spar* is a beautiful fibrous variety of gypsum, exhibiting a fine play of light, and employed for necklaces, inlaid-work, and other ornamental purposes, but having the disadvantage of being easily scratched.

GYRA'TION, CENTER OF. See CENTER OF GYRATION.

GYRENCEPHALA, certain mammals including quadrumanous primates, carnivores, ungulates, proboscidians, cetaceans, etc., in which the superfices of the cerebrum lie in convolutions, and the cerebrum extends over more or less of the cerebellum, and over the olfactory nerves.

GYR-FALCON, or JER-FALCON (*falco gyr-falco* or *F. islandicus*), a species of falcon (q.v.) of large size, the female, which is the largest, being about 2 ft. in entire length; the plumage almost brown when the bird is young, but gradually changing to white as it advances in age, the white margin of each feather encroaching on its brown center, until aged birds are almost pure white. It is rarely seen in Britain, and very rarely in the southern parts of the island, but inhabits all the very cold northern parts of the world. It was formerly in high esteem for falconry, and was procured at great expense from Iceland and Norway. It is sometimes called ICELAND FALCON, and sometimes GREENLAND FALCON.

GYRI'NUS, a Linnæan genus of coleopterous insects, now constituting a family, *gyrinidæ*, closely allied to *dytiscidæ*, or water beetles (see DYTISCUS), but differing in having the antennæ very short, the two fore-legs long and stretching forward like arms, the other legs very short and comparatively broad. The eyes are divided by horny processes, so that each of them almost becomes two. The body is oval, as in the *dytiscidæ*. The *gyrinidæ* are very generally characterized by metallic brilliancy of color. They are mostly small insects. They fly well, swim and dive well, spend the winter in the mud at the bottom of ponds, and in spring and summer may be seen swimming very actively on the surface of the water, ready to dive on the slightest alarm. In

diving, they carry down with them a bright bubble of air. They generally swim in little parties, seeming to chase each other in circles, whence their French name, *tourniquets*, and their English name, *whirligigs*. They feed on smaller aquatic animals, which they seize in their gyrations. They deposit their eggs on the leaves of aquatic plants. Their larvæ are aquatic, having their bodies composed of thirteen deeply divided rings, of which three bear the feet, and the rest bear filaments probably serving as organs of respiration. The most common British species is *gyrinus natator*, a smooth shining blackish insect, three lines long.

GYROMANCY (*gyros*, a circle, and *manteia*, prophecy) was a method of divination by means of a circle, and was generally performed in the following manner: the soothsayer described a circle, and marked it all round with letters; then he commenced to walk round the circle, repeating his incantations, and at the places where he stopped the letters were carefully noted, and by the interpretation put upon these letters, the answer of the god was obtained.

GYROPHORA. See TRIPE DE ROCHE.

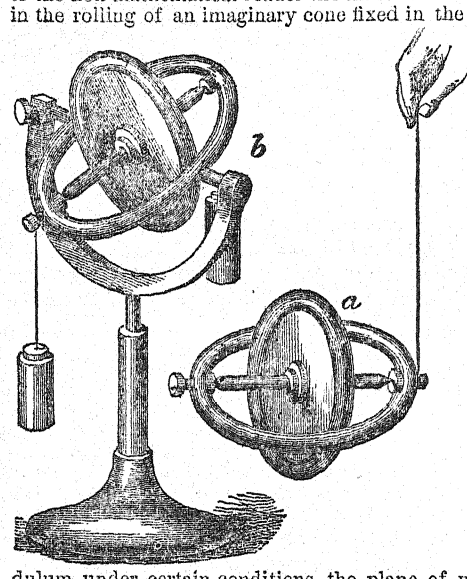
GYROSCOPE, an instrument invented by M. Foucault to render palpable to the eye the earth's rotation. Its success depends on the principle, that if a mass be set in rotation freely in space, it will, unless disturbed or constrained, preserve absolutely the plane of its rotation, and will, to effect this, even overcome slight obstacles. In the gyroscope, a heavy ring of metal is almost freely suspended by mechanical contrivances, after having communicated to it a very rapid motion, and to maintain itself in the plane of its rotation, while the earth in revolving on its axis turns round the whole mechanism, it causes a graduated slip to move round under a telescope placed in position, and so renders the earth's motion palpable to the eye.

GYROSCOPE (Greek) [from *Supplement*] is the name given to an instrument for the exhibition of various properties of rotation and the composition of rotations. It differs from a top in having both ends of its axis supported. The invention is probably French or German, and in some of its forms it dates from about the end of the last century; but no certain information can be obtained on these points. We will consider only two of its many applications.

First, if a mass be set in rotation about its principal axis of inertia of greatest or less moment, it will continue to revolve about it; and, unless extraneous force be applied, the direction of the axis will remain unchanged. Such, for instance, would be the case with the earth, were it not for the disturbances (see NUTATION and PRECESSION) produced by the sun and moon; the direction of the axis would remain fixed in space (i.e., the pole-star would be always the same star), in spite of the earth's motion in its annual orbit. It is for this very reason that modern artillery is rifled, so that the projectile revolves about its axis. If, then, a mass of metal, as, for instance, a circular disk, loaded at the rim, and revolving in its own plane, be made to rotate rapidly about its axis of greatest moment of inertia, and if it be freely supported (in gimbals, like the box of a compass), the direction of its axis will be the same so long as the rotation lasts. It will therefore constantly point to the same star, and may, of course, be employed to show that the apparent rotation of the stars about the earth is due to a real rotation of the earth itself in the opposite direction. This application was made by Foucault shortly after his celebrated pendulum (q.v.) experiment, and he is generally looked upon as the inventor. The *Transactions of the Royal Scottish Society of Arts*, however, show that this application of the gyroscope was made many years before (Mar., 1836), by Mr. E. Sang, C.E. It is, in practice, by no means so perfect a mode of proving the earth's rotation as the Foucault pendulum; but this arises solely from unavoidable defects of workmanship and materials—the mass of the gimbals, and the friction on the pivots. Prof. Smyth, the Scottish astronomer-royal, has recently applied this property of the gyroscope to the improvement of our means of making astronomical observations at sea. A telescope, mounted on the same support as the ends of the axis of the gyroscope, will, of course, be almost unaltered in position by the rolling or pitching of a vessel; and a steady horizon, for sextant observations of altitude, is procured by attaching a mirror to the support of the gyroscope, and setting it once for all by means of spirit-levels. The mechanical difficulties of construction have not yet been quite got over, but there seems to be little doubt that this application will some day be of very great practical value.

But the most singular phenomena shown by the gyroscope are those depending on the *composition* of rotations. We have already seen (ROTATION) that any motion whatever of a body which has one point fixed is of the nature of a rotation about an axis passing through that point. Hence, simultaneous rotations about any two or more axes, being a motion of some kind, are equivalent to a rotation about a single axis. The effect, then, of impressing upon the frame in which the axis of the gyroscope is suspended a tendency to rotate about some axis, is to give the whole instrument a rotation about an intermediate axis; and this will coincide more nearly with that of the gyroscope itself, as the rate of its rotation is greater. It is hardly possible to explain

to the non-mathematical reader the exact nature of the compound motion, which consists in the rolling of an imaginary cone fixed in the gyroscope upon another fixed in space; but the rotation of the axis of a top round the vertical (when it is not "sleeping" in an upright position), and the precession of the earth's axis, are precisely similar phenomena. Thus, when the gyroscope is spinning, its axis being horizontal, a weight attached to the framework at one end of the axis (fig. *b*) makes the whole rotate about the vertical; attached to the other end, the rotation takes place in the opposite direction. And the framework may be lifted by a string attached near one end of the axis (fig. *a*) without the gyroscope's falling. Its axis still projects horizontally from the string, but it revolves as a whole round the string. Various other singular experiments may be made with this apparatus; and others, even more curious, with the gyrostat of W. Thomson (q.v.), which is simply a gyroscope inclosed in a rigid case, by which the ends of its axis are supported. When a gyrostat is made the bob of a pendulum under certain conditions, the plane of vibration of the pendulum turns, as in Foucault's celebrated experiment, but in general at a much greater rate.



GYROVAGI, *wandering monks*. Monasticism, as it spread in the ancient church, took, almost immediately, the form of life in common in monasteries. Anthony, the chief originator of the institution, while for a long time he persistently sought a hermit's life for himself, found many seeking out his most lonely retreats and planting themselves near him, in order to imitate his example. At length, compelled to yield to their importunity, he induced them to live together, and to adopt rules, to some extent at least, for governing both their devotions and their work. Thus the rudiments of monasteries grew up in the remote mountain wilds. Many useful and beneficent consequences followed the increasing establishment of them through the deserts of Egypt and along the shores of the Euxine. A generous hospitality prevailed in them all. The traveler was welcomed and supplied with lodging and food. The Cœnobites of Egypt, especially, raised corn abundantly, and sent ship-loads of bread and clothing to the poor of Alexandria. But at the same time wild and ridiculous excesses grew naturally out of the system. Bands of roving devotees, known in different places by different names, infested whole districts of country from the Nile to the Black sea. Some of them, professing to practice continually mental prayer, were named *euchites*. Others, given to mystical dancing, were called *choreutes*, and a third class were *enthusiasts*, indulging in pretended spiritual communications. They abandoned all useful employments and all regular practice of devotion; although they professed to give themselves up to spiritual contemplations, which not unfrequently, through necessary reaction, degenerated into gross licentiousness. Similar wandering habits prevailed in connection with western monasteries, which were also, at first, centers and schools of useful industries of various kinds. Many monks, breaking away from conventual discipline, traveled from place to place and from convent to convent, entertained a short time at each, according to the generous hospitality practiced at them all, but evading all propositions to stay permanently at any. When they had gone round the whole circle they from necessity began again. From this feature of their history, some of them had the epithet *gyrovagi*—circulating vagabonds or tramps—fastened on them. Isodore of Seville extended the appellation also to the *circumcelliones* (q.v.); and it is equally appropriate to the whole tribe, the earliest as well as the latest, in the east as well as the west. They were all a great nuisance in the convents, carrying everywhere idleness and vice in their train. Augustine wrote strongly against them. Benedict made his rules with them specially in view. Columbanus condemned the monastic degeneracy which they had done so much to produce. But not until the time of Charlemagne were they effectually restrained. The later *mendicant* orders seem to be in some measure their successors.

GYU'LA, a t. of Hungary, in the co. of Bekes, is situated on the White Körös, which divides it into the German and Hungarian quarters, 30 m. n. of the town of Arad. The trade is chiefly in cattle. Pop. '69, 18,495.

GYTHIUM, a t. in ancient Achæa, on the Laconian gulf near the site of the modern port Marathonisi. It lay opposite the island Cranæ, at the foot of the fertile valley of

the Gythius. On its coins the common types are Apollo and Heracles, the founders of the city. Heracles, the Phenician god Melkart, points to an early connection with Tyre. The Phenicians maintained a great trade with the shores of the Laconian gulf, and Aphrodite Migonitis, the Phenician Astarte, had a temple at Migonium, the modern Marathonisi. Aphrodite and Asclepius also occur on its coins, and the latter had a temple in the city. A great port in the period of Phenician intercourse, Gythium became a secondary town after the Dorian conquest, as is proved by the absence of early coins; and it is only after the decay of Sparta that it again becomes an important city. It was the ordinary station of the Spartan fleet, and was considered a port of Sparta, from which it was distant about 30 miles. In the wars against Athens it was therefore exposed to frequent attacks. Tolmidas, the Athenian commander, burned it 455 B.C. Later it was besieged unsuccessfully by Epaminondas, 370 B.C. It was strongly fortified by the tyrant Nabis; but he was compelled by Flamininus to give up Gythium and other coast towns to the Achæan league, 195 B.C. When, soon afterwards, the whole country became a Roman province, Gythium had its own magistrates. Augustus made it one of the twenty-four Eleuthero-Laconian towns. The existing ruins, called Paleopoli, are all of the Roman period. According to Strabo, it had an artificial harbor, of which no trace is now seen. In the town was a well sacred to Asclepius, and at three stades' distance was the stone Argos, where Orestes was relieved from his madness.

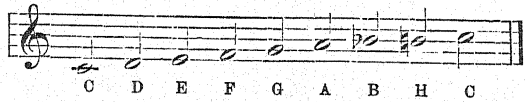
H

H THE eighth letter in the English alphabet, belongs to the order of gutturals, and is a mere attenuation of the sound indicated by the Greek χ and the German (and Scotch) *ch*. The tendency of guttural sounds to become lighter and lighter, and at last disappear, is strikingly seen in tracing the history of the letter *h*. The form of the character corresponds to the Phenician or Hebrew *cheth* (ח) and the Greek *eta* (Η, probably at one time pronounced *heta*) which denoted originally the *syllable che*. The Greeks dropped the guttural part of the sound, and took the character to mark the vowel *ē*, while in the Latin alphabet it was taken to mark the (faint aspirated) guttural. That the sound of *h* in Latin must have been faint, is proved by the fact, that many words were written indifferently with or without an *h*; as *honustus* or *onustus; aheneus* or *aëneus*. In the languages derived from the Latin, the force of *h* has almost disappeared. It is retained in French as a character, but is scarcely heard in pronunciation. The Italian language altogether ignores the character. In Spanish, it has taken the place in many cases of the Latin *f*, as *hijo* = Lat. *filius*, a son; *humoso* = *fumosus*, smoky.

In the languages of the Gothic stock, *h* often represents the hard guttural sound of *k* or *c*. See letter C. This substitution, and the subsequent disappearing of *h*, especially before *r* and *l*, have completely disguised the relationship of many words which are yet of the same root: e. g., Eng. *raw*; Ang.-Sax. *hreaw;* Lat. *cru*-or, blood, *cru*-dus, bloody, raw.

The natural tendency in English, as in other tongues, is to attenuate the sound of *h*, and altogether eliminate it. This tendency is strongest among the illiterate, who are unrestrained by the presence of the written character; and accordingly "to drop one's *h*'s' (e. g., *am* for *ham*) is a sign of the want of education and of vulgarity. The perversity of putting *h* where it ought not to be (e. g., *heggs* for *eggs*), is not easily accounted for.

The Germans use the letter H, in their musical notation, for the same note which we call B, while they call our B flat simply B; possibly from the flat seventh being more nearly related to C, as a fundamental note, than B natural the sharp seventh is, which they designate H. Thus,



HAAR'LEM, the chief t. of a district of the same name in the province of north Holland, is a clean, well-built city, lying on the shores of the Spaarn, 12 m. w. of Amsterdam, and intersected, like most Dutch towns, with canals and avenues of trees. Pop. '75, 33,364. Haarlem is the seat of government for the province, and the see or a Catholic bishop. Among its 13 churches, the principal is that known as the great of St. Bavo's Kerk, which was built in the 15th c., is one of the largest in Holland, and specially noted for its lofty tower and famous organ, constructed by Müller of Amsterdam, which, till recently, was the largest of its kind, having 5,000 pipes, 60 stops, and 4 rows of keys. Before the church stands a statue of Laurens Coster (q.v.), to whom his countrymen ascribe the invention of printing. Among the buildings worthy of note are the town-hall, with its fine carvings, formerly the residence of the counts of Holland; the palace of the states-general; the prison; and the Teyler institution, richly endowed

to defend the Christian religion and promote science and the fine arts. It has also a handsome building occupied by 24 poor old women, and has numerous scientific and antiquarian collections. Haarlem has a good gymnasium, numerous academical, scientific, and benevolent institutions, and also a national normal school for training teachers. Although Haarlem is no longer celebrated, as in former times, for its flourishing trade, it still possesses extensive refineries of salt, tanneries, foundries for type, various manufactories of silk, linen, and thread, and an extensive trade in flowers, sending its tulips, hyacinths, and other bulbs, to the value, in 1874, of £37,500, to every part of Europe. Haarlem was a flourishing town as early as the 12th c., when it took an important part in the wars between the Hollanders and West Frisians. At the close of the 15th c., it lost its privileges, and suffered severely during the revolt of the peasantry; and during the war of independence, it underwent a seven months' siege in 1573–73, which is unparalleled in the annals of history for the heroism evinced by the citizens. The wood of Haarlem is a great ornament to the city, and a favorite place for recreation. Haarlem has railway communication with Amsterdam, Rotterdam, and the Nieuwe Diep.

HAARLEM LAKE, which is now drained (see POLDER), lay between the towns of Haarlem, Leyden, and Amsterdam, and communicated with the Zuider Zee by "Het Y." Before its drainage (1839–52), it embraced the four ponds of Haarlem, Leyden, Spieger, and Helle, which, in consequence of an irruption of the sea in the 16th c., when several villages were destroyed, had merged into one vast sheet of water, and in the course of time encroached so far upon the adjacent land as ultimately to cover an area of more than 60,000 acres. The depth did not exceed 15 ft., more than half of which was composed of mud and clay, from which the Dutch prepared a kind of brick known as "klinkers," used for purposes of paving. The lake frequently rose during storms to an alarming height, necessitating a large annual outlay in keeping the dams and sluices in repair. In consequence of the damage done to Amsterdam and Leyden by an overflow of the lake in 1836, the government entered into an agreement with a company of English engineers to drain it. This undertaking was effected by several gigantic steam-engines, by which the water was pumped up into a canal, formed round the circumference of the lake, and connected with the Ij by various outlets. By these means the waters were drained off, except channels for the purpose of drainage, and more than 50,000 acres of good land reclaimed, producing large crops of colza, flax, wheat, rye, barley, oats, madder, mustard, and other seeds. In 1874 there were 2,867 horses, 5,897 head of cattle, 7,923 sheep, and 1803 goats. Pop. '75, 12,570, with 2 Dutch Reformed, 2 Dissenting churches, and 3 Roman Catholic chapels.

HABAKKUK, Greek forms, *Ambakoum*, *Abacum*, etc.; Latin, *Ambacum*, *Ambacuc*, *Abacuc*), the eighth of the twelve minor prophets. No account whatever is contained in the book itself either of the events of his life, or even the date when he lived; and the numberless conjectures that have been made respecting him are unworthy of notice.

In turning to the book itself, we find him, first of all, bewailing the general corruption of his people, and prophesying the speedy vengeance of God by the hand of the Chaldeans. These, however, shall, when they have fulfilled the divine wrath, perish suddenly themselves, because of their own iniquities; and the prophet winds up with thanks for this just retribution. It is evident from this that Habakkuk must have lived at a late period, about the time of Nebuchadnezzar's invasion; but whether he wrote, as the rabbinical traditions suppose—at the time of Manasseh, or as others (Keil, Davidson, Delitzsch) assume, at the early time of Josiah, or, finally, in the days of Jehoiakim, according to Ewald, Rosenmüller, Knobel, Meyer, De Wette, Hitzig, Stähelin, are points upon which we cannot enter. We must not omit to mention here, that the various chapters have also been supposed to have been written under different successive kings (Rosenmüller, Kalminsky, etc.); but the unity of the whole book is so obvious, that this notion has been almost unanimously rejected.

Critics have, in all times, been unanimous in their praise of the style of this prophetic composition. It ranks, indeed, for grandeur and sublimity of conception, for vigor and fervor of expression, for gorgeousness of imagery, for melody of language, among the very first productions of sacred literature. It is more especially the peculiar strophic arrangement of the second chapter, with its awful four "woes" denounced against the Chaldeans, and above all, that matchless "Pindaric Ode," as Ewald calls the third chapter, which have challenged universal attention and admiration.

HABAKKUK, BOOK OF (*ante*), consists of two parts: I. *The Foretelling of the Chaldean invasion of Judea.* 1. The prophet complains of the prevalence of iniquity and violence among the Jews. 2. God replies, threatening to punish them by allowing the Chaldeans to come against them. 3. The prophet then humbly expostulates with God for using, as an instrument in punishing the Jews, a nation more guilty than they. 4. God again replies, promising that he will, at the right time, deliver his people, and will fill the earth with the knowledge of his glory. 5. The destruction of the Babylonian empire is foretold with attending judgments on the Chaldeans for their covetous exaltation of themselves on the ruin of others; their murderous violence in building up their cities; their enticement of men to drunkenness as a means for effecting their fall; and their extension of idolatrous worship. II. *The prophet's prayer followed by a sublime*

ascription of praise and declaration of continued trust. 1. Prayer that God would give increased energy to his promised work of mercy that reaches through the ages. 2. Praise for his interposition in behalf of his people in Egypt, at the Red sea, and in the promised land. 3. Expression of confidence in him that, in times of utmost want and peril, he will give triumphant deliverance.

HAB'EAS COR'PUS, WRIT OF, a writ directed by courts of law or equity to produce the body of a person illegally detained, and to state the reasons of such detention, so that the court may judge of their sufficiency. This writ is one of the chief guards of English liberty, and the envy of foreign nations, being one of the best securities against tyranny ever devised. It is often erroneously supposed that this efficacious protection of personal freedom was first bestowed by the statute of 31 ch. II. c. 2, called the habeas corpus act. But the true foundation of that act, as well as of many other cardinal principles of the English constitution, is to be found in the great charter, or Magna Charta, of which Hallam (1 *Const. Hist.* 16) observes: "No freeman could be detained in prison except upon a criminal charge on conviction, or for a civil debt. In the former case, it was always in his power to demand of the court of king's bench, a writ of *habeas corpus ad subjiciendum*, directed to the person detaining him in custody, by which he was enjoined to bring up the body of the prisoner, with the warrant of commitment, that the court might judge of its sufficiency, and remand the party, admit him to bail, or discharge him, according to the nature of the charge. This writ issued of right, and could not be refused by the court." The great charter, as prof. Creasy sums up this part of its substance, "contained two great principles. First, that no man shall be imprisoned on mere general grounds of suspicion, or for an indefinite period, at the discretion or caprice of the executive power; but that imprisonment shall be only inflicted as the result of a legal trial and sentence, or for the purpose of keeping in safe custody, when necessary, an accused person on a definite charge, until he can be tried on that charge. Secondly, that, as a general rule, every person accused of a criminal offense shall have the question of his guilt or innocence determined by a free jury of his fellow-countrymen, and not by any nominee of the government." And Blackstone, with great spirit, thus discourses on the social and political effects of this feature of the British constitution (1 Bl. *Com.* 135): "Of great importance to the public is the preservation of this personal liberty, for if once it were left in the power of any the highest magistrate to imprison arbitrarily whomever he or his officers thought proper, there would soon be an end of all other rights and immunities. Some have thought that unjust attacks, even upon life or property, at the arbitrary will of the magistrate are less dangerous to the commonwealth, than such as are made upon the personal liberty of the subject. To bereave a man of life, or by violence to confiscate his estate without accusation or trial, would be so gross and notorious an act of despotism, as must at once convey the alarm of tyranny throughout the kingdom; but confinement of the person by secretly hurrying him to jail, where his sufferings are unknown or forgotten, is a less public, a less striking, and therefore a more dangerous engine of arbitrary government. And yet, sometimes, when the state is in real danger, even this may be a necessary measure. But the happiness of our constitution is, that it is not left to the executive power to determine when the danger of the state is so great as to render this measure expedient, for it is the parliament only or legislative power that, whenever it sees proper, can authorize the crown, by suspending the habeas corpus act for a short and limited time, to imprison suspected persons without giving any reason for so doing."

The habeas corpus act, which was passed in 31 ch. II. c. 2, therefore did not introduce any new principle, but merely defined with greater precision and detail the appropriate remedies, in consequence of the frivolous objections made by the judges in the preceding reign. The substance of these details is as follows: Where any person is committed and charged with crime, the lord chancellor or any of the judges may, unless there has been great delay in application, issue the writ, and order the person to be brought up and discharged with or without bail. The writ is to be obeyed more or less promptly according to the distance, but in no case must the delay exceed twenty days. Any officer or keeper neglecting to deliver a copy of the warrant of commitment, or shifting the prisoner to another custody without cause, shall forfeit £100, and for the second offense £200, and be disabled to hold office. No person once delivered by *habeas corpus* shall be recommitted for the same offense under a penalty of £500. Every person committed for treason or felony may insist on being tried at the next assizes, or admitted to bail, unless the crown witnesses cannot be ready in that time; and if not tried at the second assizes or sessions, he shall be discharged from the imprisonment. The prisoner may apply either to the court of chancery, or to the courts of queen's bench, common pleas, or exchequer, and any judge denying such writ is liable to a fine of £500. The writ may be applied for by persons confined in any part of England, or Jersey and Guernsey. Indeed, it was recently held, in the case of Anderson the fugitive slave, that this writ could be applied for by a person confined in Canada or any other of the colonies, even though there were courts established there which had previously been applied to, and had the power to issue the writ, but refused to do so. The judges of the queen's bench, on examining the authorities, held that this prerogative power had always been inherent in the English court in favor of British subjects wherever imprisoned, except in a foreign country, and had

never been taken away by express statute. There has now, however, been passed a statute (25 Vict.) depriving the English courts of this jurisdiction over the colonies, whenever local courts exist by which such a jurisdiction can be exercised.

As the habeas corpus act extended only to cases where persons are imprisoned on criminal or supposed criminal charges, the other cases being left to the operation of the common law, which was found defective, the statute 56 Geo. III. c. 100 was passed, which extended the writ to other cases. Under this last act, any person confined or restrained of his liberty (otherwise than for criminal matters, and except persons imprisoned under a judgment or decree for debt), may apply to any judge of the common law courts for a *habeas corpus*, on showing by affidavit that there is a reasonable and probable ground for complaint.

The result is, that in all cases whatever where a person, whether man, woman, or child, is illegally confined in England, the remedy is for some friend to apply for a *habeas corpus*, which, on a good *prima facie* case, will be issued to the person who so illegally confines the applicant; and if such person refuses to make a proper return—that is, show good legal grounds for what is done—he will be committed for contempt. If the party is confined under recognized authority, as a child by a parent, these facts must be stated. If the party is confined under some legal authority, then the warrant of commitment must be produced, and the rule is that such warrant must set forth the subject matter, and the jurisdiction of the judge or justice who so committed the party, so that the legality of the imprisonment may be judged of.

The habeas corpus act does not extend to Scotland, but in that country similar redress is provided to the subject under the wrongous imprisonment act, 1701, c. 6 (q.v.), which is often called the Scotch habeas corpus act.

Habeas corpus is also the formal commencement of several other legal writs in English law of a kindred nature to that last mentioned, and which is strictly called the writ of *habeas corpus ad subjiciendum*. Thus, the *habeas corpus ad respondendum* is a writ issued by a common law court to bring up a prisoner to serve him with a writ in another action. So a *habeas corpus ad satisfaciendum* is a similar writ to take the prisoner in execution for another cause of action. *Habeas corpus ad testificandum* is the writ by which a prisoner is brought up by the jailer to give evidence as a witness in a court of justice.

HABEAS CORPUS (*ante*), sometimes called "the great writ of personal liberty," is an inheritance of this country from England, and the grandest safeguard against despotism which jurisprudence affords. It is a writ of rights. Any person restrained of liberty from whatever cause is entitled to it upon petition under oath, and if his imprisonment is adjudged by a court having jurisdiction to be illegal, he will be set at liberty. The writ proceeds upon the assumption that every human being, unless he is either convicted or accused of crime and held for trial and punishment in due process of law, is entitled to freedom from bodily restraint. A court having power to issue the writ must issue it upon application in due form, and, after examination, must pronounce judgment upon the case before him. The person to whom the writ is addressed must come into court, bring his prisoner with him, and make disclosure of the grounds upon which he is held. Disobedience to the order of a court in such a case subjects the offender to severe punishment. The scope of the writ is very broad, even covering the case of a child who is restrained by one of its parents from intercourse with the other. In such a case the court will determine whether the parents have equal rights in the child, and if not, whether the father or mother is its lawful custodian. In the days of slavery the writ was often issued in behalf of slaves who had escaped from their masters, and when it was shown that the masters themselves had brought them into a state where slavery was unlawful, the court set them free. Chief-justice Shaw of Massachusetts was the first to avow and act upon this principle; but afterwards, in cases where slaves had run away from a state in which slavery was regarded as lawful, and the master had caused them to be arrested by the authority of the United States, he refused to interfere in their behalf. There were not wanting men eminent for legal learning who held that this writ, if it were only enforced in the spirit of the English law, as expounded by lord Mansfield in the celebrated Somerset case, brought to his attention by the pertinacity of Granville Sharp, would free every slave in the United States; it being held that slavery here had never been established by law, but was a usurpation from the beginning, and contrary to the genius of republican institutions. It was upon this principle, if not by this process precisely, that slavery was abolished in Massachusetts; and if the principle could have been made effective in all the states of the union, the slaves would have been emancipated peacefully and the country saved from the horrors of a desperate and bloody civil war. So important did the fathers deem the writ of *habeas corpus* that they inserted in the constitution of the United States (art. I., sec 9) an express provision that it should not be suspended "unless when in cases of rebellion or invasion the public safety may require it." The question whether the power to suspend is vested in congress or the president, or in each alike, has been much disputed. The power was exercised by the president during the late rebellion, with the tacit consent or express permission of congress. The power of the federal courts to issue the writ is limited in its scope by certain well understood principles, but that power, as far as it extends, is

sovereign. No state court has a right to issue the writ for the discharge of a person held under the authority of the federal government. It cannot, for instance, discharge a soldier of the United States upon any pretense whatever, or inquire into the legality of the detention of a prisoner by the national authority. The national courts alone have jurisdiction in such cases. The proceedings upon a return of a writ may take place in chambers before a single judge or before several judges in open court, according to the terms of the writ itself.

HABEN'DUM, in English law, is the name given to a clause in a deed of grant or lease, in which clause the kind and nature of the estate is described, and it is stated for how long the estate is to be held.

HABE'RE FA'CIAS POSSESSIO'NEM, in English law, is the name of the writ which issues after a successful plaintiff has recovered judgment in an action of ejectment. He then calls on the sheriff, by this writ, to put him in possession of the land or premises, and the sheriff executes it by breaking open the doors, if necessary, and then delivering over the possession to the plaintiff. *Habere facias seisinam* is a similar writ, now superseded by the last.

HABER'GEON, a short coat of mail, consisting of a jacket without sleeves. In early times, the habergeon was composed of chain-mail; but in the 14th c., a habergeon of plate-armor was worn over the hauberk. See HAUBERK.

HABERSHAM, a co. in n.e. Georgia, on the South Carolina border, on the headwaters of the Chattahoochee river; 450 sq.m.; pop. '70, 6,322—949 colored. The surface is rough. Iron, gold, rubies, and diamonds have been found. Corn and tobacco are the main products. Co. seat, Clarksville.

HABERSHAM, JOSEPH, 1751–1815; b. Geo.; lieut.col. in the revolution. He was for two terms speaker of the Georgia assembly, and in 1795 Washington made him postmaster-general.

HABINGTON, WILLIAM, 1605–45; son of Thomas, a leading Roman Catholic, to whose wife was attributed the exposure of the gunpowder plot. William was educated first at St. Omer, and refusing to become a Jesuit, was removed to Paris. On his return to England he fell in love with lady Lucy Herbert, second daughter of lord Powis, whom he celebrated under the poetical name of "Castara." After some opposition he won her hand, and they were married about 1632. In 1634 he published his famous volume of lyrical poems entitled *Castara*, which was reprinted in 1635 and 1640. In the latter year he also published a prose *History of King Edward IV.*, and *The Queen of Aragon*, a tragi-comedy. This play was published at the request of his kinsman, the earl of Pembroke; it was afterwards revived by Samuel Butler. The last work printed by Habington was *Observations upon History*, 1641. In 1647 his father died; and during the commonwealth, as we learn from Anthony Wood, the poet, "did run with the times, and was not unknown to Oliver the usurper." Habington possessed all the faults of his age except its impurity; he is honorably known as the chastest of the royalist lyrists. His genius was very fantastic, mild in its play of fancy, delicately ingenious, and of an unruffled stately dignity. He never rises to sublimity or passion, but is always refined and often extremely graceful.

HABIT. This familiar word applies to a certain portion of our acquired powers or aptitudes. Common usage does not very closely define the kind or extent of acquisitions intended by it. Habits may be either intellectual or moral. We speak of a habit of talking or writing, as well as of a habit of early rising, or of truthfulness. The principle of the human constitution on which the growth of habit depends, when generalized to the utmost, may be called the power of *retentiveness*, or of plastic growth, and is one of the foundations of the intellect, inasmuch as memory and all the other intellectual faculties involve it in a greater or less degree. See INTELLECT, and ASSOCIATION OF IDEAS. Education of every kind must proceed upon this property, and should be conducted in conformity with its exact nature and laws. The maxims that govern the formation of habits are the same as the principles of mental acquirement in every shape. Some of the most important of these may be indicated here.

1. It should be understood, at the outset, that all persons are not alike susceptible of the growth of new powers, or of the process of education; nor is the same person equally susceptible as regards all subjects. The consequence is, that a much greater amount of practice is necessary in one case than in another; iteration being the mode of supplying the defective cohesiveness of the system.

2. However common the remark, that youth is the season for improvement, it may be doubted if we generally appreciate to the full degree the superior plasticity of early years, and the gradual decrease of the property as life advances. The as yet unoccupied state of the infant mind must be taken into account along with the very great energy of the principle of growth, which gives a firmness and security of hold to early impressions beyond everything that is communicated in later life. We see this in the impossibility of eradicating a provincial accent after one has grown to maturity; so the opinions and sentiments contracted in youth can seldom be changed in middle or advanced life.

3. In aquiring habits, the favorable disposition of the mind is of the greatest importance. Liking, taste, or predilection for the task concentrates all the energies of the

system upon the work, and favors to the utmost the cementing process. A strong natural liking will often compensate for want of natural aptitude, by making the most of what power there is.

4. In the default of natural liking for the subject, the attention may be secured to a certain extent by pains and penalties; but as these waste and enfeeble the powers of life altogether, there is a loss on the whole, although there may be a gain in the particular case. The education of the young cannot be conducted wholly on the principle of fascination; but if pain has to be frequently or systematically resorted to, no considerable general progress need be looked for.

5. Health, freshness, and vigor in the bodily system are conditions of the growth of habit. The brain may be powerful in a feeble body, but a certain co-operation of the other organs is necessary to the integrity of its functions; and when the stage of nervous exhaustion has been reached, there is nothing gained by continuing the exercise. After adequate rest and refreshment, the plastic property is at its height; there is a limit to what it can perform, which is marked by the approaching sense of fatigue; and at this point, the efforts in the way of learning should cease. The prevailing error hitherto has been to overrate this limit, and to keep up school exercises too long at one time. A short intermission enables the work to be resumed.

6. These observations apply to mental acquisitions generally. In the peculiar case of *moral* acquisitions—such as habits of fortitude, courage, contentment, honest dealing, obedience—some special considerations are applicable. In the first place, there must be a powerful *initiative*, or some influence strong enough to make a decided commencement and to keep up the desired conduct for a certain length of time. Either the coercion of some authority, or a powerful example, or an energetic resolution of the individual will, should induce the person to enter on the course prescribed, and to persevere until the plastic process, in other words, the power of habit, has had time to operate. The commencing stimulus may then be gradually withdrawn in favor of the self-sustaining force that iteration has engendered.

HABITA'TION, in the Roman law, meant a servitude by which a person could only use a house as a habitation or dwelling-house, and for no other purpose. In England and Scotland, such a restriction can only be produced by the operation of express covenants or stipulations in the lease.

HABIT AND REPUTE, a phrase used in Scotch law to denote something so notorious that it is taken without further proof to be true. The best known example of this is where a man and woman cohabit as husband and wife, and are reputed by the neighbors to be married, in which case the law of Scotland, with great liberality, assumes, as a positive and incontrovertible fact, that a previous marriage had taken place, and no evidence to contradict such a presumption, or legal fiction, is even allowed. In England, no such doctrine prevails, and the marriage would have to be proved in the usual way, if called in question, by a suit which directly raises such question, though the parties had all their lives lived together as man and wife.—There is also, in Scotland, an application of the doctrine of habit and repute to persons when convicted of stealing; for if the individual is a habit and repute thief—i.e., a notorious thief—his offense is greater and liable to a more severe punishment. In England, a somewhat similar effect is produced more circuitously, by proving after the trial that the thief had been several times previously convicted, in which case he is generally punished by a severer sentence.

HACHETTE, JEAN NICOLAS PIERRE, 1790–1834; a French mathematician. He became a deputy-professor at Mézières, and when the École Polytechnique was established, he was chosen on its staff, being appointed along with Monge over the department of descriptive geometry. There he instructed some of the ablest Frenchmen of the day, among them Poisson, Arago, and Fresnel. Accompanying Guyton de Morveau in his expedition, he was present at the battle of Fleurus, and entered Brussels with the French army. In 1816, on the accession of Louis XVIII., he was expelled from his chair by government, at the same time that his friend and fellow-worker Monge was removed from the institute. He retained, however, till his death the office of professor in the faculty of sciences in the École Normale, to which he had been appointed in 1810—the same year in which he married the daughter of the physician Maugras. The necessary royal assent was in 1823 refused to the election of Hachette to the academy of sciences, and it was not till 1831, after the revolution, that he obtained that well-merited honor. Hachette was held in high esteem for his private worth, as well as for his scientific attainments and great public service. His labors were chiefly in the field of descriptive geometry, with its application to the arts and mechanical engineering.

HACK'BERRY. See NETTLE TREE.

HÄCKEL, or HAECKEL, ERNST HEINRICH; b. Germany, 1834; studied botany and medicine, and has devoted much attention to biology. He is professor of zoology at Jena. He was among the first of German writers to agree with Darwin, and is one of the foremost leaders in that school of biologists. He has published several works on biological themes, in which he has advanced some interesting theories of his own.

HACKETT, HORATIO BALCH, D.D., LL.D., 1808–75; b. Mass.; studied theology at Andover and in Germany; was professor of Latin in Brown university, professor of literature in the Newton theological institution, and of New Testament Greek in Rochester theological seminary. Among his publications are a Chaldee grammar, a Hebrew grammar, *Commentary on Acts; Philemon* (with notes); *Christian Men in the War;* and several translations.

HACKETT, JAMES HENRY, 1800–71; b. New York; an actor who first appeared on the stage in 1826, and rapidly earned a prominent position, especially in eccentric parts. Among his impersonations best known were *Justice Woodcock; Sylvester Daggerwood; Mons. Morbleu; Dromio; Rip Van Winkle; Nimrod Wildfire; Sir Pertinax McSycophant;* and far beyond all others, *Falstaff;* in which he had no compeer. He played with much success in England, and in all parts of the United States. He was one of the lessees of the Astor place opera house at the time of the Forrest-Macready riot.

HACKETTSTOWN, a village in Warren co., N. J., on the Musconetcong river, and the Delaware, Lackawanna and Western railroad (Morris and Essex division), 52 m. w. of Newark; pop. 2,800. It is the seat of the centenary (Methodist) collegiate institution, and has a number of important manufactures.

HACKLÄNDER, FRIED. WILH., a popular German poet, was b. at Burtscheid, near Aix-la-chapelle, Nov. 1, 1816. After several vicissitudes, he proceeded to Stuttgart, where he commenced his literary career with *Bilder aus dem Soldatenleben im Frieden*, which appeared in the *Morgenblatt*, and has since been translated into several languages. The truth and pleasant humor of this little book attracted the attention of baron von Taubenheim, who invited Hackländer to accompany him on his travels to the east. The literary fruits of this journey were *Daguerreotypen, aufgenommen auf Einer Reise in den Orient* (2 vols. Stuttg. 1842; 2d edit. 1846), and the *Pilgerzug nach Mekka;* a collection of oriental tales and legends. At a later period he published *Wachtstuben-abenteuer* (a continuation of the *Soldatenleben*), *Märchen*, and a variety of smaller works. In Mar. 1849, he went to Italy, was present in the campaign in Piedmont, and afterwards published his *Soldatenleben im Kriege* (2 vols. 1849–50). In 1849 he married and settled near Stuttgart, where he has since published several humorous romances: *Handel und Wandel* (2 vols. 1850), *Eugene Stillfried* (3 vols. 1852), *Namenlose Geschicten* (3 vols. 1851), etc. Hackländer has been styled the German Dickens. His comedy entitled the *Geheimer Agent* has been performed on all the stages of Germany, and translated into Hungarian, Polish, and English. His *Magnetische Curen* was a success. Other works of his are *Ein Winter in Spanien* (1855); *Der neue Don Quixote* (1858); *Künstlerroman* (1866); *Zwölf Zettel* (1867); *Das Geheimniss der Stadt* (1868); the play *Die Marionetten* (1868); and *Kainszeichen* (1874).

HACKEL, or HATCHEL. See HECKLES, *ante.*

HACK'MATACK. See LARCH.

HACK'NEY, the name of a parish of England, in the co. of Middlesex, which now forms a suburb of London, and is 3 m. n.n.e. of St. Paul's. It was at one time a favorite suburban residence of the London citizens, but the current of fashion having for many years been setting to the west, Hackney no longer holds the rank it formerly did. In its earlier and fashionable days, it is said to have given its name to hackney-coaches.

HACKNEY-COACHMEN differ in no respect from other carriers, except that in addition they are generally put under police regulations in all the towns and cities of the United Kingdom, and a tariff of fares imposed upon them. They require a license from the town-council or other similar body, and must conform to the regulations imposed by this authority. In London acts of parliament have been passed to define these regulations, and the legal fare is fixed at 6d. per mile, or part of a mile. In other cities and towns, the legal fare is higher.

HADAD, the name in Scripture of a Syrian deity. The divinity primarily denoted by the name is, according to Philo of Byblos, the king of gods, the greatest and highest, the sun. The Syrian kings of Damascus seem to have habitually assumed the title of Benhadad, or son of Hadad (three of this name are mentioned in Scripture), just as a series of Egyptian monarchs are known to have been accustomed to call themselves sons of Ammon-Ra. The word Hadadrimmon, for which the inferior reading Hadarrimmon is found in some MSS., in the phrase "the mourning of (or at) Hadadrimmon," has been a subject of much discussion. According to Jerome and all the older Christian interpreters, the mourning for what occurred at a place called Hadadrimmon (Maximianopolis) in the valley of Megiddo is meant, the event alluded to is generally held to be the death of Josiah; but since Hitzig and Movers the opinion has been gaining ground that Hadadrimmon is merely another name for Adonis or Thammuz, the autumn sun-god, the allusion being to the mournings by which the Adonis festivals were usually accompanied.

HAD'DINGTON, a market t. and royal and parliamentary borough of Scotland, capital of the co. of the same name, is situated at the foot of the Garleton hills, on both sides of the river Tyne, about 16 m. e. of Edinburgh. The old abbey church, a fine Gothic

structure, in partial ruin, and situated close to the banks of the river, is the most interesting object in the town. John Knox and George Wishart preached in this church. Among the other principal buildings may be mentioned the corn exchange, necessarily a very commodious building, Haddington being one of the largest grain-markets in Scotland. The inhabitants are chiefly dependent upon agriculture, but there are nurseries, corn-mills, breweries, tanneries, etc., in the town and vicinity. Haddington unites with North Berwick, Dunbar, Jedburgh, and Lauder in sending a member to parliament. Pop. '71, 4,007.

HADDINGTONSHIRE, or EAST LOTHIAN, a maritime co. in Scotland, lying between n. lat. 55° 4′ and 56° 5′, and w. long. 2° 25′ and 3° 2′, is bounded on the n. and e. by the Firth of Forth and the German ocean, s. and s.e. by Berwickshire, and on the w. by Midlothian. The extreme length is about 25 m., and breadth about 17; area, 179,142 acres, or 280 sq miles. In the s. of the county are the Lammermuir hills, rising to the height of 1732 feet. In the n. and n.e. is a strip of level ground of unequal breadth, composed of clay and loam, and mostly very productive for all kinds of crops. The climate is excellent on the lower grounds, and the rainfall much under the average. There are few streams of any considerable size, the principal being the Tyne, which flows n.e. across the county into the sea at Tyningham. East Lothian has long enjoyed high agricultural fame. John Cockburn of Ormiston, who is regarded as the father of improved Scottish husbandry, and who was born in this county in the end of the 17th c., was the first to test its capabilities. This enterprising man gave long leases, and encouraged his tenantry to lay out their farms in regular inclosed fields. He introduced the culture of turnips, rape, and clover; and turnips in drills were sown on one of his farms as early as 1725, and brought to such perfection in ten years thereafter, that a specimen of a turnip, weighing 35 pounds, was sent for public exhibition to Edinburgh. Potatoes were also first planted in the fields in 1734 at Ormiston. Pennant says that hedges round fields were first planted in this county, and here the thrashing-machine was first introduced, in 1786, by a native, Andrew Meikle. In Sept., 1862, the first steam-plow possessed by a tenant-farmer in Scotland was introduced into this county by Mr. Sadler, Ferrygate. The well-known varieties of wheat, Hunter's, Hopetoun, Fenton, and Shireff's bearded, all originated in Haddingtonshire.

According to the agricultural statistics taken in 1876, the total number of acres under rotation of crops was 113,615. There were 8,879 acres under wheat; 17,202 under barley; 16,296 under oats; 1,342 under beans; 9,345 under potatoes; 15,899 under turnips; and 26,451 under clover, sanfoin, and grasses under rotation. The number of draught and other horses was 3,727; cattle, 7,072; sheep, 108,447; swine, 2,790. On comparison with the other Scotch counties, it will be found that there are only two with a greater acreage of wheat and potatoes, 4 with more barley, and 12 with more turnips; while in yield per acre Haddingtonshire occupies a very high position, particularly in its crops of oats. The land rental, exclusive of railways, in 1876–7 was £304,312; railways, £26,237. Old valuation (1674), £14,072. Coal and limestone are abundant. The former was wrought in the 13th c., the earliest recorded in Scotland. Haddingtonshire returns one member to the house of commons; its parliamentary constituency in 1876–77 was 939. Pop. '71, 37,771.

Historical interest is confined almost entirely to the battle-field of Dunbar, where Cromwell defeated the covenanting army in 1650; and Prestonpans, where the pretender defeated the royal troops in 1745. Among the antiquities may be named the ruins of the castles of Tantallon, Dirleton, Luffness, Hailes, and Innerwick. The principal towns are Haddington, Dunbar, and North Berwick.

HADDOCK, *Gadus* or *Morrhua æglefinus*, a fish of the same genus with the cod, and much resembling it in general appearance. The number of fins is the same as in the cod, there being three dorsals and two anals. The haddock, like the cod, has a barbule at the point of the lower jaw. The haddock is brown on the back, silvery on the belly; the lateral line is black, and there is a black spot behind each of the pectorals, these spots sometimes extending so as to meet on the back. A ridiculous legend ascribes these spots to the finger and thumb of St. Peter, and states the haddock to be the fish from the mouth of which he took the tribute money, "the inventors of the legend never adverting to the improbability of a marine fish living in the fresh-water lake of Gennesaret." The haddock, indeed, is not even found in the Mediterranean. Nor does it enter the Baltic, although plentiful in the northern parts of the Atlantic ocean, both on the European and the American coasts. On the British coasts it is abundant almost everywhere, appearing in great shoals at particular seasons, but in size and quality the haddocks taken at one part of the coast differ much from those of another. Those of the e. coast, and particularly those caught in deep water, are in great esteem, and those of Dublin bay are remarkable for their large size. A haddock of 16 lbs. has been taken in Dublin bay. Generally, however, this fish is much smaller. It is taken both by trawl-nets and lines. Pieces of the herring and sand-eel are most attractive baits. The haddock, when really of good quality, is perhaps the finest of all the *gadidæ;* and the numbers taken on some parts of the British coasts are very great, rendering it, in an economical point of view, a very important fish. It does not "take salt" so well as the cod, but is often cured by drying and smoking. In Mar. and April

the haddock is out of season; in Oct., Nov., Dec., and Jan., it is in finest condition. *Finnan haddocks* and *bervies* are well known, particularly in the Scottish markets.

HADDOCK, NORWAY, an ocean fish of the mailed-cheek kind or family; from 12 to 24 in. long; the body and the upper side of the head covered with stiff scales. It is of a bright red color when living, but after death turns partially white. It is often called the snapper, rose fish, or red perch. It is abundant off Newfoundland. Greenlanders make needles of its spines.

HADDOCK, CHARLES BRICKETT, D.D., 1796—1861; b. N. H.; graduated at Dartmouth and studied theology at Andover. He was prof. of rhetoric and *belles-lettres* in Dartmouth for 19 years, and of intellectual philosophy and political economy for 16 years. In 1850 he was U. S. minister at Lisbon. He was several times chosen to the New Hampshire legislature and was the chief promoter of the common school system of the state. He was equally prominent in advancing railroads. Many of his addresses and reports have been published.

HA'DERSLEBEN, or HADERSLEV, a t. of the German empire, in the n. of the province of Sleswick-Holstein, on the Hadersleben fiord, a narrow arm of the sea, stretching inland westward from the Little Belt, 33 m. n. of Flensborg. The church of St. Mary is a large and handsome edifice. Hadersleben has a port for small vessels; and a gymnasium. Pop. '75, 8,362. Hadersleben, which formerly belonged to Denmark, received its town-rights from Waldemar II., in 1292; and here, in 1448, count Christian of Oldenburg was elected king of Denmark, and began the present dynasty.

HA'DES, in Greek mythology, was the god of the lower world, more commonly spoken of as Pluto (q.v.); the name was also applied to his kingdom, the abode of the departed spirits or shades. See GREEK RELIGION, also HEAVEN and HELL.

HADJI. See HAJJ, *ante.*

HADES (*ante*), a Greek word signifying literally *unseen*, was employed by the classic writers to denote the region of the dead which, as they believed, was in part the wretched prison of the wicked, and in part the elysian abode of the blessed. In the Greek translation of the Old Testament it is used as the equivalent of the Hebrew *sheōl* which denotes the region of departed spirits, sometimes without referring to any separation between the righteous and the wicked; and at other times marking the separation clearly. While the Greeks and the Jews were so far agreed concerning the abode of the dead, there was one great difference between them. The former had no hope of deliverance from *hades* as they had no faith in a resurrection. But among the Jews the expectation of a resurrection was the chief comfort in connection with death. The ancient believers, it is said, looked for a heavenly country and for the city which God had prepared. The Psalmist said, in his expression of confidence in God, "Thou shalt guide me by thy counsel and afterwards receive me to glory." The prophecies of Isaiah, Hosea, and Daniel, contain promises of a resurrection. These and similar declarations gave the Jews a hope concerning the future state, that heathen nations did not possess. In the New Testament the Savior's use of the term is of paramount importance. On one occasion, in declaring the consequences that would follow Capernaum's neglect of its privileges, he contrasted *hades* with *heaven*. At another time, with reference to the welfare of his church, he promised that the gates of hades should not prevail against it. In the parable of the rich man and Lazarus he represents the former as tormented after death, in hades, and the latter as happy in the society of the blest, a great gulf being fixed between the two. After his ascension to heaven, appearing in vision to the apostle John, he affirmed that he himself had the keys of hades and of death; and revealed to him the casting of them both into the lake of fire. To the question, Was Christ in hades during the interval between his death and resurrection? some reply, 1. That the apostle Peter taught that he was, in applying to him Psalm xvi, "Thou wilt not leave my soul in hades, neither wilt thou suffer thine holy one to see corruption." This implies (they say) that, for a time, his soul was in hades but returned from it before his body was in any degree changed. The answer to this is that the apostle quoted the Greek translation which conveys the general meaning but will not bear any emphasizing of the preposition "in." The Hebrew original, "Thou wilt not forsake or abandon my soul *to* sheol," clearly expresses the idea that his soul would not even enter it. 2. The same apostle is appealed to again as confirming the construction put on his quotation by teaching in his first epistle that Christ went and preached to the spirits in prison, that is in hades. To this the answer is that though the spirits referred to were in prison when the apostle wrote, Christ's preaching to them had been before his incarnation during the divine forbearance in the days of Noah. 3. The apostles' creed (it is said), declares that Christ, after his death, descended into hades. To this the answer is that the creed, with all its excellences, is not known to be the work of apostles; and that, while all the rest of it can be traced back at least to the 3d century, the clause, "he descended into hades," was not in it even at the beginning of the 5th, (nor has the Nicene creed, adopted 325 A. D., any such clause). Therefore, as it was added at so late a period when erroneous views of various sorts had become common, the clause has no claim to be believed merely because it is in the creed. Our knowledge concerning the place in which the human soul of Christ rested during the period referred

:o, is limited by his promise to the penitent thief, "This day shalt thou be with me in *paradise*;" and by his subsequent invocation to the Father, "Into *thy hands* I commend my spirit." Besides the use of the word *hades* by the Savior and with reference to him, it occurs in the New Testament only in Paul's apostrophe, "O grave, where is thy sting? O hades, where thy victory?"

HADITH (something new, a story, legend, tale; emphatically, Hadith Ar-Rassul), the traditions about Mohammed the prophet's sayings and doings, which, as a complementary to the Koran, form, together with it, the supreme authority for all religious and legal questions of the Mohammedans. Originally, it was not allowed to commit them to writing (like the Mishnah, q. v.), but the danger of their being entirely forgotten in the course of time, led to their being written down in the first centuries after Mohammed. Those who, notwithstanding, know them well by heart are honored with the title of Hafiz (retainer, keeper). The six principal sources for these traditions are Ayeshah, after the death of Chadija, the prophet's favorite wife; Abu Hureira, his constant companion and servant; Abdallah Ibn Abbas; Abdallah bnu Omar b. Al-Ass; Djaber b. Abdallah Ansari; and Ans b. Malik. The principal and most authoritative collections of traditions are those of Bochari, Malik, Abu Dhaud, Tarmesi, Nissai, Moslem, and Sojuti. Of these, again, the most important code is the *Sahih* of Bochari, who, it is said, spent sixteen years of his life in traveling through the length and breadth of the land for the purpose of collecting such traditions, and who singled out, from a number of 60,000, about 7,270 as alone genuine. This code was printed for the first time with commentaries (Delhi, 1848—1854), of which only three copies are to be found in Europe —one is at present in the British Museum; and another edition (by Krehl, in Leyden) has been published. See SUNNA, MOHAMMED, MOHAMMEDANISM.

HADJI KHALIFAH, the surname of MUSTAFA-BEN-ABDALLAH, a celebrated Turkish historian, who was b. at Constantinople about the end of the 16th c., and died in Sept., 1658. From 1622 till 1633 he was employed in the Turkish army, and had an excellent opportunity of acquiring information regarding matters of history, geography, etc., of which he eagerly availed himself.

Hadji's works are written in Turkish, Arabic, and Persian. Besides a number of smaller works on geography and history, we have the celebrated *Asam al-kolouh ve al-fonoum* (Names of Books and Sciences), written in Arabic, and of which Flügel has given a translation with the text under the title *Lexicon Bibliographicum et Encyclopædicum a Mustafa-ben-Abdallah* (Leip. 1835–58, 7 vols). There is also a French translation, by Petis de la Croix (1694–1705), which is to be seen in MS. in the imperial library. In this work Hadji gives a definition of each science and the principal writers on each; specifies the titles, contents, language, dates of composition, and translations of more than 25,000 works; also the names of the authors and dates of their death. It is the most complete catalogue in existence of works written in Arabic, Persian, and Turkish; *Tarikh Kebir* (Great History), a history of the world from the creation of Adam to 1655, containing notices of 150 dynasties, principally Asiatic; also a history of the Ottoman empire from 1591 to 1658; and a history of the maritime wars of the Turks, which has been translated into English (Lond. 1831).

HADLEY, a village in Hampden co., Mass., on the Connecticut river, 18 m. n. of Springfield; pop. township, 2,125. This ancient village is the seat of the Hopkins academy, and has considerable manufacturing industry. It is in the midst of charming meadow scenery fringed with mountains.

HADLEY, JAMES, 1821–72; b. New York. An accident in boyhood made him hopelessly lame, and gave him an impulse of study, and he soon became distinguished in his knowledge of ancient languages. He graduated at Yale, first in his class, and was tutor in Middlebury college and afterwards at Yale. He passed through the theological course at New Haven, but did not enter the ministry, becoming assistant professor of Greek in Yale college in 1848, and in 1851 professor, and continuing in that chair till his death. He was very efficient personally as a teacher, and was also one of the most eminent linguists of his time, being familiar with Sanskrit, Hebrew, Greek, Latin, Arabic, Gothic, Armenian, and several modern languages, including Welsh and Swedish, and early forms of English. He was the author of the *History of the English Language* in the introduction to Webster's dictionary. He was an able student of comparative philology, and vice-president of the American philological association. He was also a member, and in 1871–72 president of the American oriental society. He was a member of the American committee for the revision of the English version of the New Testament, and wrote the article on the *Language of the New* in Smith's *Dictionary of the Bible*. He also wrote an essay on the Greek accent which was republished in Curtius's *Studien zur griechischen und lateinischen Grammatik*. He published *Lectures on Roman Law*, *Elements of the Greek Language*, and a Greek grammar very widely used; and after his death a volume of his writings, entitled *Essays Philological and Critical*, was edited by prof. W. D. Whitney.

HADLEY, JOHN, an English mathematician, the intimate friend of Newton, from whom, as is now generally supposed, he borrowed the idea of the instrument called Hadley's quadrant (see SEXTANT). In 1717 he became a member of the royal society,

before which he read some useful papers, which were afterwards published in their *Transactions*. The honor of having invented the sextant is claimed by their supporters for Hadley, Godfrey, and Newton; for Hadley, because he was the first to construct the instrument and give a description of it, which he did in 1731, before the royal society; for Godfrey, because, in 1730, he presented a gentleman in Philadelphia, U. S., with a description of the instrument almost coinciding with Hadley's, which description was transmitted to the royal society in 1732; and for Newton, because he, in 1727, gave a description of the instrument to his friend Hadley, who, for some reason unknown, suppressed it, and it was not till after his death in 1742 that it was discovered. The royal society decided that Godfrey and Hadley were both entitled to the honor of the invention, and accordingly each received a reward of £200. He died Feb. 15, 1744.

HADRAMAUT, a large district of Arabia, next to Yemen, lying along the Indian ocean 1200 m. from Aden to cape Ras-el-Hadd. This coast has been visited and partially explored by capt. Wellsted and other navigators. It presents everywhere much the same dreary appearance as that of the Hejaz and Tehamah—a narrow fringe of sand or of equally sterile shore; beyond this rises a mountain range, varying, so far as any tolerably accurate calculations have been made, from 1000 to 3,000 ft. in height; its formation appearing to be in many places volcanic. Behind this comes a second and loftier mountain belt, Jurassic in its general character, resembling the highlands of Yemen; while far beyond stretches away the great sandy desert, varied, however, where it approaches the mountain-foot, by oases of considerable fertility, among which that of Wadi Doan is said to be the most extensive. Several barren islands and reefs fringe the waste. The mountains of Hadramaut form one system with those of Yemen, but, unlike the latter, seem to be of an almost monotonous sterility. Torrents descend from them, but no rivers; nor though lakes are mentioned in the very apocryphal records of the Arabs, has any signs of their existence been verified. The climate is intensely hot, and said to be unhealthy, at least to strangers. Vegetation is scanty. No part of the peninsula has been less explored than this, even by the orientals themselves; and European travelers have supplied few reliable data for what regards the physical characteristics of the interior, any more than its inhabitants and products.

HADRIAN, WALL OF. See ROMAN WALL.

HADRIA'NUS, P. ÆLIUS, a Roman emperor (117–138 A.D.), was b. at Rome, Jan. 24, 76 A.D. During the reign of Trajan, who was his guardian, and with whom he was connected by marriage (his father, who was a Roman senator, having married the aunt of Trajan), he filled several high offices in the state. He accompanied the emperor in his wars against Decebalus, where he distinguished himself by his bravery; and in 117, when Trajan set out on his return to Italy, he was left behind with the army as governor of the province of Syria. When the intelligence reached Antioch that Trajan had died in Cilicia on his journey home, Hadrianus was proclaimed emperor by the army, Aug. 11, 117 A.D. The state of the empire at the time was extremely critical. Insurrections had broken out in Egypt, Palestine, and Syria; Mœsia in the east, and Mauritania in the west, were both invaded by barbarian hordes, while the Parthians had once more asserted their independence, and won several successes over the imperial forces. Hadrianus, perceiving the advantage of a peaceful policy, wisely resolved to limit the boundaries of the Roman dominion of the east, and concluded a peace with the Parthians, surrendering to them all the country beyond the Euphrates. In 118 he repaired to Rome (where he had been acknowledged by the senate), established his authority by liberality towards the people, and suppressed with great severity a patrician conspiracy against his life. The Roxolani (modern Russians), who had made an inroad into Mœsia, were induced to retire by large gifts. In the year 119, for the purpose of becoming acquainted with the state of the provinces, he commenced his celebrated journey, which he is said to have performed chiefly on foot. He visited Gaul, Germany, Britain (where he built the famous wall extending from the Solway to the Tyne), Spain, Mauritania, Egypt, Asia Minor, and Greece, whence he returned to Rome, 126 or 127 A.D., and received the title of *pater patriæ*. Hadrianus spent the years 132 and 133 in Athens, for which city he had a great predilection. After once more visiting Syria, he returned to Italy, and spent the last years of his life at Rome and Tibur. During the severe illness which carried him off July 10, 138, at Baiæ, he was subject to violent outbursts of cruelty, to which, as well as to jealousy and pleasure, he was naturally addicted. After the death of Lucius Ceionius Commodus, whom he had adopted under the name of Lucius Ælius Verus, he appointed Titus Aurelius (afterwards the emperor Antoninus Pius) his successor. During his reign the army was vigorously disciplined and reorganized, so that the barbarians were not likely to attribute Hadrianus's conciliating and peaceful policy to fear or weakness. As a civil ruler, he merits high praise, particularly for the just and comprehensive view he appears to have taken of his duties as a sovereign. Hence to him is attributed, more than to any other, the consolidation of the monarchical system of Rome. Hadrianus also divided Italy into four parts under four consuls, to whom was intrusted the administration of justice. Hadrianus erected numerous splendid edifices, the chief of which were—the mausoleum called the *Moles Hadriani*, in Rome (the groundwork of the modern castle of St. Angelo), the Ælian bridge leading to it, and the magnificent villa at Tibur. He like-

wise laid the foundation of several cities, the most important of which was Adrianopolis, Hadrianus was a lover of the fine arts (in the history of which, as well as of jurisprudence, his reign forms an important era), of poetry, philosophy, and rhetoric, all of which he attempted. He set a high value on Greek literature, and likewise on the cultus of Greece, and caused himself to be initiated into the Eleusinian mysteries.

HADROSAURUS, a genus of extinct gigantic reptiles of the order DINOSAURIA (q. v.) according to the classification of Huxley. The general characteristics of the *dinosaurs* are: they were sometimes naked, but were usually covered with a well-developed exo-skeleton, consisting of bony shields resembling those of the crocodile; anterior trunk ribs, double headed; teeth confined to the jaws, and implanted in distinct sockets; always two pairs of limbs, strong, and furnished with claws; but the most remarkable feature in their organization was the structure of the pelvis and hind limb, which approximated to that of the same parts in birds. All the genera of the order DINOSAURIA belong exclusively to mesozoic time, ranging from the triassic to the cretaceous periods, but particularly abounding in the oölitic, and lower and middle cretaceous epochs. The number of dinosaurian reptiles was very large, and represented by many genera, among which, beside hadrosaurus, are the *iguanodon* (q. v.), *cionodon, chondrosteosaurus, cetiosaurus, laosaurus, megalosaurus* (q. v.), and *titanosaurus* (q. v.). Hadrosaurus much resembled the *iguanodon*, but was rather smaller, the largest species being about 30 ft. long, while the *iguanodon* was probably over 40 feet. Like the *iguanodon*, the hadrosaurus fed upon vegetable substances, such as shrubs, leaves, etc. Among the species may be mentioned *hadrosaurus foulkii*, from New Jersey, about 28 ft. long; *hadrosaurus minor*, about half as long; and *hadrosaurus agilis*, from Kansas (Marsh).

HADRUMETUM, a city on the African coast of the Mediterranean on the gulf of Hammamet. A Phenician colony of earlier date than Carthage, in course of time it became subservient to the imperial city, and fell along with it under the power of the Romans. On the subdivision of the Roman province of Africa Propria, it became the capital of Byzacium. By Trajan it was made a colony, as is evinced by the grandiloquent inscriptions preserved by Gruter—*Col. Concordia Ulpia Trojana Augusta Frugifera Hadrumetina.* From the devastation inflicted by the Vandals, it was restored by Justinian, and in consequence it bore for some time the name of Justinianopolis.

HAECKEL. See HÄCKEL.

HÆMA—in compound words. See HEMA—in compound words.

HÆMATO'XYLINE is a chromogen (a term used by chemists to denote certain nearly or quite colorless substances which, under certain influences, yield well-marked colors) obtained from logwood (*hæmatoxylon campeachianum.*) Its composition is represented by the formula $C_{32}H_{14}O_{12} + 6aq.$, and in its pure state it occurs in transparent glistening straw-colored prisms. It has a sweet and not astringent taste, is sparingly soluble in cold water, but dissolves readily in boiling water, alcohol, and ether. The watery solution is not affected by the oxygen of the air, but if a very small quantity of ammonia is added, it assumes an intensely reddish purple color.

Hæmatoxyline is obtained by mixing powdered extract of logwood with quartzose sand (to prevent its agglomeration into lumps), and digesting this powder for several days with about six times its volume of ether. The liquid is then distilled till the residue assumes the consistence of a sirup. If this residue is mixed with water, crystals of hæmatoxyline are in a few days deposited, which on an average weigh about one-eighth of the extract that was employed.

The color reactions of this substance with metallic compounds are singular, and in consequence of the tinctorial power of some of them, deserve a brief notice. Solution of acetate of lead gives with one of hæmatoxyline a white precipitate, which speedily becomes blue; salts of copper give a dirty green precipitate, which also soon becomes blue; chloride of barium produces a red precipitate; protochloride of tin gives a rose-colored, and iron alum, a scanty blackish precipitate.

The purple color which the solution of hæmatoxyline assumes if oxygen and ammonia are present, is due to a decomposition, of which a substance termed *hæmatein* is one of the products; the compound resulting from the union of hæmatein and ammonia possessing this tint.

The solution of hæmatein-ammonia (or hæmateate of ammonia, as some chemists have termed it) yields colored precipitates with many metallic salts; with acetate of lead, it gives a deep blue, with sulphate of copper, a violet blue, with protochloride of tin, a violet, and with iron alum, a black precipitate.

It is upon the various reactions which have been described in the preceding paragraphs that the value of logwood as a dye depends.

HÆMO—in compound words. See HEMO—in compound words.

HÆMUS, MOUNT. See BALKAN.

HÆRE'DITAS JA'CENS, in Scotch law, means the heritable estate which a deceased person has left, as it remains before the heir has made up a title to it, and when therefore the property lies to a certain extent in abeyance. When a creditor of the deceased wants to recover his debt, he was formerly compelled by a circuitous process first to

compel the heir to complete his title, or declare his refusal to do so; but now, by the titles to land (Scotland) act, 31 and 32 Vict. c. 101, he merely raises an action in the usual way, and obtains a decree of adjudication, under which he can help himself to the property. The expression of hæreditas jacens is not used in England, where similar niceties of feudal conveyancing have long been extinct.

HÆRE'TICO COMBUR'ENDO, an old writ in English ecclesiastical law for burning a heretic, now abolished by 29 Chas. II. c. 9.

HAFF, a word now obsolete in current German, signifies, in the Danish language, the sea, or a considerable portion of the sea. In German, it occurs as only the proper name of three estuaries of peculiar form on the southern coast of the Baltic—viz., the Stettin haff (q.v), the Frisches haff (q.v.), and the Kurisches haff (q.v.). Haff-fishing is a term used by the inhabitants of Shetland to signify sea-fishing.

HAFIZ (one who knows the Koran and the Traditions by heart), MOHAMMED, SHAMS-AD-DIN (sun of religion), also called LISHAN-AL-GHAID (voice of mystery), an eminent Persian divine, philosopher, and grammarian, and one of the greatest poetical geniuses of all times. He was born in the beginning of the 14th c. at Shiraz, and early applied himself to the pursuit of science and learning. His proficiency in various branches of knowledge brought him under the notice of the then reigning house of Muzaffer, and he was not only appointed teacher in the royal family, but a special college was founded for him. His spirit of independence, however, stood in the way of his worldly advancement, and notwithstanding many offers of princely favor, he remained during his whole life in the humble condition of a dervish. The burden of his poetical compositions is for the most part wine, love, nightingales, flowers—in fact, beauty in every form; occasionally also the praise of Allah and the prophet, and reflections upon the instability of life and its joys; through all of them, there runs, however, a withering contempt of all professional piety, mock-humility, and sanctified abhorrence of the good things of this world. These poems are of such exquisite sweetness, that the poet has also received the name of *Tschegerleb* (Sugarlip); and his contemporaries speak of his having drunk from the fountain of life, a draught of which was brought to him, in reward for his untiring perseverance in study, and his power of self-abnegation, by Zikhr (the Mohammedan Elijah) himself. No less remarkable are the sudden and striking transitions in his writings, and the readiness of wit which he displayed on several noticeable occasions during his lifetime.

Hafiz was married, and appears to have reached a happy old age. The time of his death is uncertain, the dates being variously given between the years 791 H. (1388 A.D., the date on his tombstone), and 797 H. (1394 A.D.). The enmity, however, which had been provoked in the breasts of the zealous defenders of religion by the freedom of his manners, and his more than Sufistic contempt for the outward forms of godliness, broke out undisguisedly at his death. The ministers of religion refused to repeat the usual prayers over the dead body, and after long altercations between the members of his family and his enemies, it was agreed that the question, according to the usual customs of the east, should be decided by lot. The result was favorable; whereupon he was buried with great honor. His tomb, situated about 2 m. to the n.e. of Shiraz, has been adorned with the greatest sumptuousness by princes and nobles, and is still resorted to by pilgrims from all parts of Persia. It has been visited and described by Kæmpfer, Pietro della Valle, Chardin, Le Bruyn, Scott Waring, W. Franklin, Ouseley, and others.

How far some of the odes of Hafiz are *bonâ fide* productions of a most licentious nature, or are intended as an allegorical and mystical revelation of things divine in the manner of Sufism (q.v.), as is declared by Hafiz's pious admirers, is a question which has at different times been raised before ecclesiastical and critical courts. A style brilliant, yet clear—imagery gorgeous, yet clothed in pure and unaffected diction—undulating melody and classical harmony, are the chief characteristics of Hafiz's anacreontic lyrics, which have not only become the national poetry of his country, but are even appealed to as an oracle on most important questions of peace and war. The number of their commentators is legion; the most valuable notes, however, are those of Shemii, Sururi, Sudi. The *Divan* was first collected by Said Kasim Anvari, after the death of the poet. Lithographed and printed editions of Hafiz have been published at Calcutta (1790 and 1826), at Bombay (1828–50), at Cawnpore (1831), Bulak (1834 and 1840), Constantinople (1841), etc. A very valuable edition by H. Brockhaus was published at Leipsic in 1854–61. Of translations in European tongues, we may mention those of Rewitzki in Latin (Vienna, 1771); Richardson, Jones, Ouseley, Hindley, Rousseau, Bicknell (1876) in English; and by Hammer-Purgstall and Daumer, in German.

HAG (*myxine* or *gastrobranchus*), a genus of cartilaginous fishes, allied to lampreys, and with them ranked among dermopterous fishes by Owen. The fishes of this genus are of low organization, and seem to connect fishes with cephalopodous mollusks. The vertebral column is reduced to a mere flexible cartilaginous tube, nor are there any other bones. The shape resembles that of an eel or worm, and Linnæus placed these animals among the *vermes*. The mouth is formed by a mere membranous ring, with a single tooth on its upper part, whilst the tongue is furnished with two rows of strong teeth, and also performs the office of a piston in the use of the mouth as a sucker. Around the mouth are eight barbules or cirrhi, which have been regarded as analogous

to the tentacles of the cuttle-fish, and are apparently the principal special organs of sensation. There are no eyes. There are six gill-bags on each side, receiving streams of water from the gullet (*œsophagus*) by as many tubes, the water being admitted to the gullet by an aperture situated rather on the left side, and carried off by a canal which opens about the end of the first third of the length. The tail is surrounded by a narrow fin. The skin is smooth and very unctuous.—One species, the GLUTINOUS HAG (*M. glutinosa* or *G. cæcus*), is found in the British seas, and is more common on the coast of Norway, where it is an object of dislike to fishermen, as they believe it to enter by the mouths of haddocks and other fishes caught in their lines, and to prey upon them so as to reduce them to mere skin and skeleton. A fish which has been thus treated is called a *robbed fish*. Six hags have been taken out of a single haddock. The hag is also said to make its way into fishes through their skin, and is therefore sometimes called the *borer*. Some suppose, however, that hags are swallowed by the fishes on which they afterwards prey. The glutinous hag attains a length of 12 to 15 in., and exudes a mucous fluid, which soon turns into a kind of jelly. It is of a dark-bluish brown color above, and whitish beneath. The quantity of mucus which it exudes is so great that a single hag, confined in a jar of water, soon turns it all into a kind of jelly. The mucus is exuded from lateral pores.

HAGAR (LXX. *Agar*), Gen. xvi. ff., an Egyptian bondwoman of Sarah. This her Semitic name (the Egyptian is unknown) has been derived from various roots, and has been translated accordingly—"slender," "stranger," and "flight" (in allusion to her after-life). Sarah having remained barren up to a very advanced age, at last gave Hagar to Abraham, ten years after his sojourn in Canaan, as a concubine—according to the eastern custom—in the hope of being "edified through her," i.e., establishing a family of her own. Hagar bore Abraham a son, whom he called Ishmael (God has heard), and in whom he for a time saw the future father of the progeny promised him. But 16 years later, and when Abraham was (we are told) a 100 years old, Sarah herself bore Isaac; and we find it significantly repeated nine times in seven verses (Gen. xxi. 2—9) that Abraham and Sarah were his parents—in repudiation, according to rabbinical authorities, of certain rumors about Isaac's illegitimacy, spread by Hagar. At last the domestic contentions that naturally arose led Abraham, though reluctantly, to cast out Hagar together with Ishmael. How the two fugitives lost their way in the desert of Beersheba; how the water in the bottle being spent, the broken-hearted mother set herself at a distance from her child, in order that she might not see his death; how her weeping and the loud voice of the boy were answered by an angel, who pointed out a well (Temzem, in the inclosure of Mecca)—all this forms one of the most touching and well-known narratives of the Bible.

In the New Testament, Hagar is referred to allegorically as Mt. Sinai or "the Jerusalem which now is" (Gal. iv. 22). Some rabbinical traditions (Ber. R. 67 d.) identify her with Keturah, the second wife of Abraham, mentioned Gen. xxv. 1; others (Ber. R. 51 d.) make her the daughter of Pharaoh, who, seeing the miraculous interference on behalf of Abraham in Egypt, said: "Better that my daughter should be the slave of this man than the queen of any other." The Mohammedans look upon Hagar as the legal wife of Abraham, and she is supposed to be buried in Mecca.

HAGBERRY. See BIRD-CHERRY and NETTLE TREE.

HAGEN, an industrious and thriving t. of Prussia, in Westphalia, is situated on the Volme, 26 m. w. of Arnsberg. It has a pop. (1875) of 24,218, who carry on puddling and ironfounding, manufactures of iron, steel, and copper goods, cloth, leather, paper, etc.

HAGENAU. See HAGUENAU, *ante*.

HAGENBACH, KARL RUDOLF, German theologian, was b. Mar. 4, 1801, at Basel, where his father, Karl Friedrich Hagenbach, author of the *Tentamen Floræ Basileensis*, was professor of anatomy and botany. While at the universities of Bonn and Berlin, he became acquainted with the direction given to theology by Schleiermacher; and on his return to Basel, he received, from his intercourse with De Wette, a fresh impulse to the development of his theological opinions. After being an extraordinary professor, he became ordinary professor of theology in 1828, becoming an honorary doctor of theology in 1830. He delivered to public audiences beyond the university, and afterwards published through the press, several courses of lectures on the nature and history of the reformation (*Wesen u. Gesch. d. Reformation*, 6 vols. 1834–43; 2d ed., 1851–56), on the early history of the church (*Aeltere Kirchengesch*, 2d ed., 1857–63), and on the church history of the 18th and 19th centuries (*Kirchengesch, d.* 18 *u.* 19 *Jahrh.*, 2 vols., 3d ed., 1856, translated into English). His tabular view of the history of dogmas (1828), and his compend of the same department of historical theology (*Lehrbuch, d. Dogmengesch.*, 2 vols., 4th ed., 1857, translated into English), are highly praised. His *Encyklopädie u. Methodologie d Theologischen Wissenschaften* is one of the most useful manuals for the student of German theology, and its popularity in Germany has necessitated nine editions. A history of evangelical Protestantism, several volumes of sermons, a memorial of De Wette, and a work on religious education in the gymnasia, have also come from his pen, and he gave proof of his poetical talents in two small volumes of poetry, and in a collection of poems entitled *Luther u. Seine Zeit.* Hagen-

bach died in 1874.—Of Hagenbach's brothers, JOHANN JAKOB gained distinction as an entomologist, and EDUARD as a physiologist.

HAGERSTOWN, a t. in Maryland, U. S., 66 m. w.n.w. from Baltimore. It is a well-built town with twelve churches, two academies, five newspaper-offices, court-house, town-hall, almshouse, and jail. Pop.'70, 5,779.

HAG-FISH, GLUTINOUS HAG, or BOREZ, a marine fish which forms with the lampreys one of the lowest orders of vertebrates. Similar in form to a lamprey, it is usually found within the body of dead cod or haddock, on the flesh of which it feeds after having buried itself in the abdomen. When caught, it secretes a thick glutinous slime in such quantities that it is commonly believed to have the power of converting water into glue. It is occasionally found in the north Atlantic and other temperate seas.

HAG'GADA (Heb. from *nagad, hagged*), to say, relate, is the free, rabbinical interpretation of Scripture, chiefly for homiletical purposes. As its name signifies, haggada was something "said" (not "received," like the authoritative halacha) (q.v.): legend, saga, tale, gnome, parable, allegory; in fact, poetry springing up from the sacred soil, wild, luxuriant, and entangled like a primeval forest. On its three principal directions—the *peshat* or hermeneutical investigation, *derush* or practical application, and *lod* or mystical illustrations—we cannot dwell here, nor can we follow Zunz's minute divisions of haggada into: 1. Targumim; 2. Haggadistic elements in halacha; 3. Ethical haggada; 4. Historical haggada; 5. Secret esoteric doctrine; 6. Special haggada. It flowed in an uninterrupted stream for more than a thousand years—from the Babylonian exile to the 10th c. A.D.—and its innumerable authors are either entirely anonymous or at best pseudonymous. It grew into immense dimensions, as, although orally delivered, parts of it were gradually added in the shape of marginal notes or glosses to Bible MSS., or were committed to writing in the shape of independent collections. These either followed the order of the Scripture, and were called after the special biblical book around which they had woven their fabric, or they were arranged and called after the Sabbatical and festive pericopes on which they treated. The most extensive collections, originally composed of single fragments, which have survived are Midrash Rabboth (commenced about 700 A.D., concluded about 1100 A.D.), comprising the Pentateuch and the five Megilloth, and the Pesikta (about 700 A.D.), which contains the most complete cycle of pericopes. Strangely enough, this latter itself had, through the many extracts made from it at an early period (jalkut, pesikta, rabbathi, sutarta, etc.), fallen into oblivion since the 13th c., until Zunz, in his *Die Gottesdienstl. Vorträge der Juden* (Berlin, 1832), not only proved its existence by evidence, but even restored it out of these fragments and parallel passages; and about the same time, the old MS., which agreed with Zunz's statements to the minutest details, was found by Steinschneider at Oxford.

For the general form of haggada, its language, its sources, and its development, no less than its vast influence on Christianity and Mohammedanism, and its immense usefulness for historical and theological investigations, we refer the reader to the articles MIDRASH and TALMUD.

Haggada shel Pesach is the name of a ritual, partly in Hebrew, partly in Chaldee, used on the two first evenings of the passover, which contains, besides a brief description of the exodus, extracts from the Scripture, the Mishna, Tosephta, Mechiltha, Sifri, and the two Talmuds, and some liturgical pieces. Originally within a very small compass, it has been extended to its present larger size by subsequent centuries. Two "Piutim," or religious poems, were added in the 11th c., and four more Hebrew and Chaldee songs (the last originally a German *Volkslied*) as late as the 14th century.

HAG'GAI (*Aggæus, Haggæus*), the tenth of the 12 minor prophets, and the first of those who prophesied in Palestine after the Babylonian captivity. Of his own history, nothing positive is known. It is related that he was born in Babylon, of priestly lineage, and came to Jerusalem at a very early age. The church fathers suppose him to have been one of the exiles who had returned with Zerubbabel and Joshua; and Ewald infers from ii. 3, that he was one of the few who had seen the first temple, in which case he must have been a very old man when he composed his book. The time of his prophecies, however, is known with accuracy to fall in the 6th, 7th or 8th month of the second year of Darius Hystaspis (cf. Ezra, v. 1; vi. 14; Haggai, iv. 24) = 520 B.C. Fifteen years has then elapsed since the foundations of the new temple had been laid; but during the reign of Cambyses and Pseudo-Smerdis, the work had been neglected, and even the most zealous men began to think that the time of the re-establishment of the sanctuary was not yet at hand. Suddenly Haggai presented himself before Zerubbabel and Joshua the high-priest, and strongly urged the re-establishment of the sanctuary, pointing at the same time to the famine in the land, as the divine punishment for the culpable neglect of the people, who only thought of their own houses, and not of that of God. His words made a deep impression, and the building was re-commenced (i.). The second discourse of the prophet—about a month later—predicts a still greater glory to the new temple than had belonged to the former (ii. 3–9). Two months afterwards he had to renew his reproaches against their inertness, and his promises of a blessed future (ii. 10–19). The fourth prophecy (ii. 20–23), delivered on the same day, is directed to Zerubbabel, and foretells great revolutions and political changes; but he,

Zerubbabel, shall remain a "signet" in the hands of God—i.e., the Jews and their princely leaders would not be harmed.

The style of Haggai is prosaic, and labors under an uncommon tameness and poverty of expression, principally apparent in the frequent repetition, within the short space of two chapters, of certain words and phrases, which could not well have been purposely retained for the sake of ornamentation (Eichh. Einl., s. 599). There is hardly any parallelism; but the prophet has endeavored to impart a certain vivacity to his writing by means of interrogation. The diction itself is, generally speaking, pure and clear. Haggai's name appears joined to that of Zechariah in some of the inscriptions of the Psalms (127 and 145–48 in lxx., 125, 126, 145–148 in Peshito, 111 and 145 in Vulgate), a circumstance which must point to the existence of an old tradition about these prophets having striven for the re-establishment of the music and singing of the psalms in the temple. Some critics suppose our present book of Haggai to be simply an epitome of some larger book, or a condensation of Haggai's orally delivered prophecies. However this may be, they have certainly not gained in strength by any such compression, as must well have been presumed.

HAGGAI, Book of, (*ante*) consists of four messages—portions of which were prophetic—delivered about 18 years after the return of the first part of the Jews from captivity. I. *On the first day of the sixth month of Darius's second year.* 1. Remonstrance against the refusal of the people to build the house of the Lord, and against their selfish devotedness to the adornment of their own houses. These facts declared to be the cause of the disappointments they had suffered in their harvests, food, clothing and income. 2. Exhortation to consider what their cause had been, and to reverse it by completing the temple; accompanied by the promise that the Lord, taking pleasure in their work, would use it for his glory; and followed by a renewed declaration that all the failure of their agricultural pursuits was on account of their neglect of the temple in their eagerness to enjoy their own houses. 3. Record of the obedience of the governor, high-priest, and people to the word of the Lord, of the divine co-operation with them, and their consequent zeal in re-entering on the required work. This practical result was reached within 24 days from Haggai's first message. II. *Within a month from that time* a second message was sent exhorting rulers, priests, and people to continued courage and zeal, and appealing specially to the old men who, having seen the first house in its glory, were now disheartened by the apparent insignificance of the second. All were assured that, in a little while, after great overturnings of governments and violent commotions among the nations, the desire of all nations would come, filling the second temple with greater glory than the first had ever known, and giving peace to men. III. *Three months* after the re-commencement of the work a third message was sent illustrating by emblems taken from the ceremonial law, the sinfulness of the people and the consequent impurity of their work, yet pledging to them that the gracious blessing of God should, from that day forward, be as conspicuous in their history as his judgments had already been. IV. *On the same day* the fourth message - addressed personally to Zerubbabel as the son of David and representing the Messiah who would descend from him—predicted again great wars and consequent overturning of kingdoms which would change the political aspect of the world, and in connection with which the Messiah would be made conspicuous as the signet of the Lord.

HAGHE, Louis, a well-known water-color painter of the present day, was b. in Belgium in 1802, but settled in London at an early age. He first acquired a reputation as a lithographer, his most splendid lithographic work being Robert's "Sketches in the Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia." Not less superb were his lithographs of his own drawings of old Flemish interiors. Subsequently, he devoted himself to painting in water-colors, became a leading member of the association formed to promote this branch of art; and in the exhibitions of this society, his productions have always been among the most attractive. Haghe displays a decided predilection for the scenery and history of his native land. Among his pictures may be mentioned the "Palace of Courtray," and the "Audience Chamber at Bruges," which are remarkable for their harmony of color, fidelity in detail, and richness of architecture. He obtained a gold medal at the Paris Exhibition of 1855.

HAGIOGRAPHA. See Bible.

HAGNER, Peter, 1772–1850; b. Penn. Washington gave him a clerkship in the treasury department in 1793, and he served in that department in various responsible positions 56 years, resigning finally in 1849. For a large part of the time he was third auditor.

HAGUE, or The Hague, (Dutch, *'s Gravenhage*), the capital of the Netherlands, and the residence of the king, is a pleasantly situated well-built city in s. Holland. Pop. '75, 97,565. It is intersected in all directions by canals, and shady avenues of linden-trees, and abounds in palaces, public buildings, and stately houses. It has a good public library, containing 100,000 volumes, and fine galleries of paintings, the choicest of which, containing some of the most precious specimens of the Dutch school, is in the palace of the present king. The town contains 20 churches, the most notable of which is the great church, founded in 1308, and distinguished for its lofty hexagonal tower

with a *carillon* of 38 bells. The Hague is the seat of both chambers of the states-general, and of various tribunals and public offices, in one of which are deposited the archives and state papers which have been preserved by the republican and regal governments of the country for 400 years. In a historical point of view, the most interesting buildings of the Hague are the Gevangenpoort, or the prison gate-house, in which Oldenbarnevelt, the brothers De Witt, and many others distinguished in the history of Holland, have at different periods been confined; the Binnenhof, in which the former of these patriots was executed, and which, together with the Buitenhof, forms an irregular mass of public buildings of various ages, inclosed by moats, and approached by draw-bridges. Besides the palace of the king, there are, within the city, several others occupied by different members of the royal family, or with various national collections of interest, the most notable of which is the Mauritz Huis, containing a splendid collection of pictures by the Dutch masters. The palace called 't Huis in 't Bosch (The house in the wood), which lies on the outskirts of the town, in the midst of a noble wood, is specially worthy of notice for the tapestry, and the frescos and other paintings which it contains by Rubens, who, in conjunction with several of his most distinguished pupils, painted the ceiling and walls of several of the apartments. The Hague is essentially a city of fashion, and its prosperity depends chiefly on the court and nobility. The trade consists principally of book-printing, lithographing, metal-founding, carriage-building, beer-brewing, distilling gin, cabinet-work, rope-spinning, making leather, etc.; and the natives of the port (Scheveningen) gain a livelihood by fishing. In the neighborhood are many handsome country seats; and not far off is Ryswick, celebrated for the treaty of peace signed there in 1697. Scheveningen is a favorite bathing-place on the sea-coast, with which the Hague is connected by a broad causeway, bordered with rows of trees. The origin of the Hague is very ancient; and as far back as 1250, William, duke of Holland and emperor of Germany, erected a hunting-seat there, on the site of an older residence of his predecessors. In the 16th c. it was the seat of government of the states-general; and in the next century it became the birthplace of many distinguished members of the house of Orange, and amongst others, of William III. of England; while, as the residence of the stadtholders, it was naturally the center of the numerous important negotiations of European diplomacy, with which they were associated. The Hague is connected by a railway with Amsterdam, 36 m. n., and Rotterdam, 13 m. south.

HAGUE, WILLIAM, D.D., b. New York, 1805; graduated from Hamilton college, and was at various periods the pastor of Baptist churches in Boston, Providence, Albany, Chicago, Newark (N. J.), and Orange (N. J.). He has published *The Baptist Church Transplanted from the Old World to the New; Home Life Christianity and Statesmanship*, and various discourses.

HAGUENAU, a t. of the German empire, in the province of Alsace-Lorraine, ceded by the French in the war of 1870–71, is situated on the Moder, 18 m. n.n.e. of Strasburg. It had been a free town of Germany before it belonged to France. It was founded in 1164 by Frederick Barbarossa, and as it was intended for the reception of the imperial insignia, it was strongly fortified. It successfully withstood many sieges, especially during the thirty years' war; but on its occupation in 1675 by the imperialists, its fortifications were destroyed. On Oct. 17, and Dec. 22, 1793, bloody battles took place here between the French and Austrians. Haguenau is a place of considerable manufacturing industry. The German spelling is *Hagenau*. Pop. '75, 11,726.

HA HA BAY, an expansion of the Saguenay river, 7 m. long, 1 m. wide, and 60 m. from its mouth in the St. Lawrence. It is in the center of some magnificent scenery, and is a great attraction for summer tourists. The upper part of the bay displays undulating meadow-land, on whose shores are the two little villages of St. Alphonse and St. Alexis, both together containing not more than 500 inhabitants. This bay received its name from the impression which its charming scenery made upon the minds of the early French *voyageurs*, in contrast with that of the gloom and solitude of the lower river.

HAHN, AUGUST, 1792–1863; a German Protestant theologian; studied at Leipsic, and in 1819 was nominated professor extraordinary of theology at Königsberg, and in the following year received a pastoral charge and a superintendency in that city. These posts, however, he resigned on his promotion in 1821 to be professor ordinarius. In 1826 he removed as professor of theology to Leipsic, where, hitherto distinguished only as an editor of *Bardesanes*, *Marcion* and *Ephraen Syrus*, he came into extraordinary prominence as the author of a treatise, *De rationalismi qui dicitur vera indole et qua cum naturalismo contineatur ratione*, and also of an *Offene Erklärung an die Evangelische Kirche zunächst in Sachsen u. Preussen*, in which he endeavored to convince the rationalists that it was their duty voluntarily and at once to withdraw from the national church. In 1833 Hahn was called to Breslau as the theological professor and consistorial councilor, and in 1844 he became general superintendent of the province of Silesia. Among the other literary labors by which he is best known are his edition of the Hebrew Bible and his *Bibliothek der Symbole und Glaubensregeln der apostolisch-katholischen Kirche*.

HAHNEMANN, SAMUEL, a celebrated German physician, was b. in April, 1755, at Meissen, a small t. in the neighborhood of Dresden, the capital of Saxony. His father—a painter of the ware known as Dresden china—intended his son to follow his

own occupation, but the boy displayed so ardent a love of letters that the head-master of the college (*Fürstenschule*) of Meissen afforded him gratuitously all the advantages of that institution, and he remained at it till he was 20 years of age. He then left Meissen, with 20 crowns as his whole fortune, and went to Leipsic, to prosecute his medical studies. Here he maintained himself by translating works out of Latin, French, and English into German. By his industry and frugality, he saved enough of money to enable him to visit Vienna, where, under the direction of Dr. Quarin, he pursued his studies, and after various vicissitudes of fortune, he returned to Saxony, and settled in Dresden in the year 1784. Here he discovered a new salt of mercury, known by the name of *mercurius solubilis hahnemanni*, and still extensively employed by physicians in Germany. He also published a monograph upon arsenical poisoning, which is distinguished by such accuracy of observation and clearness of diction as to be quoted with approval by Christison and other modern toxicologists. After spending four years in Dresden, where he had for a time the direction of a large hospital, he returned in the year 1789 to Leipsic. In the following year, while translating Cullen's *Materia Medica* out of English into German, his attention was arrested by the insufficient explanations advanced in that work of the cure of ague by cinchona bark. By way of experiment, he took a large dose of that substance, to ascertain its action on the healthy body. In the course of a few days, he experienced the symptoms of ague; and it then occurred to him that perhaps *the reason why cinchona cures ague is because it has the power to produce symptoms in a healthy person similar to those of ague.* To ascertain the truth of this conjecture, he ransacked the records of medicine for well-attested cures effected by single remedies; and finding sufficient evidence of this fact, he advanced a step further, and proposed in an article published in *Hufeland's Journal*, in the year 1797, to apply this new principle to the discovery of the proper medicines for every form of disease. Soon afterwards, he published a case to illustrate his method. It was one of a very severe kind of colic cured by a strong dose of *veratrum album*. Before this substance gave relief to the patient, it excited a severe aggravation of his symptoms. This induced Hahnemann, instead of drops and grains, to give the fraction of a drop or grain, and he thus introduced *infinitesimal* doses. Some years later he applied his new principle in the treatment of scarlet fever; and finding that belladonna cured the peculiar type of that disease which then prevailed in Germany, he proposed to give this medicine as a *prophylactic*, or preventive against scarlet fever. From that time it has been extensively employed for this purpose. In the year 1810 he published his great work entitled *Organon of Medicine*, which has been translated into all European languages, as well as into Arabic. In this book he fully expounded his new system, which he called homœopathy. See HOMŒOPATHY. His next publication was a *Materia Medica* consisting of a description of the effects of medicines upon persons in health. These works were published between the years 1810 and 1821, at Leipsic, where he founded a school, and was surrounded by disciples. As his system involved the administration of medicines, each separately by itself, and in doses infinitely minute, there was no longer any need of the apothecary's intervention between the physician and the patient. In consequence of this, the apothecaries' company brought to bear upon Hahnemann an act forbidding physicians to dispense their own medicines, and with such effect that he was obliged to leave Leipsic. The grand duke of Anhalt-Köthen appointed him his physician, and invited him to live at Köthen. Thither, accordingly, he removed in the year 1821, and there he prepared various new editions of his *Organon* and new volumes of his *Materia Medica* for publication. In 1835 he married a second time; his wife was a French lady of considerable position; and in the same year he left Köthen, and settled in Paris, where he enjoyed a great reputation till his death, which took place in the year 1843. On the centenary of his birth-year, in 1855, a statue was erected to his honor at Leipsic, at the expense of his disciples in Germany, France, England, and other countries, with the concurrence of the local authorities, which supplied the site in one of the public places in their handsome town.

Hahnemann is universally acknowledged to have displayed great genius, industry, and erudition. Jean Paul Richter calls him "a prodigy of philosophy and learning." He was a man of unblemished purity of morals, and his life, as well as his writings, was characterized by strong natural piety. He left a numerous family of sons and daughters.

HAHN-HAHN, IDA, Countess, daughter of Karl Friedrich, count von Hahn, a well-known authoress, was b. at Tressow, in Mecklenburg-Schwerin, June 22, 1805. At the age of 21 she married a relative of her own; but the union proving unhappy, was dissolved in 1829. The lady sought consolation in poetry and travel, and visited Switzerland, Vienna, Italy, Spain, France, Sweden, and finally Syria and the east. In 1850 sick of her restless and unsatisfactory mode of life, she embraced Roman Catholicism, and two years later, entered the mother-house of the order of the Good Shepherd at Angers. Her writings, consisting of poems, novels, voyages, etc., are voluminous, and are generally marked by morbid sentimentality and aristocratic prejudice. She is sometimes clever, and even brilliant, but always superficial. Several of her novels have been translated into English.

HAICTITES, the name given to a Mussulman sect, which attempted to amalgamate their own and the Christian religion, and anticipated the second coming of Christ to

judge the world, because the Koran says: "Oh Mohammed, thou shalt see thy Lord coming in the clouds."

HAIDUCKS (i.e., drovers, from the Hungarian *hajdú*, plural *hajduk*), originally a designation of cattle-herds in Hungary. Afterwards, the word came to signify a class of mercenary foot-soldiers ready to accept pay from any one who would employ their services, but displaying great gallantry on the field of battle. The remarkable constancy with which they stood by Bocskai throughout the war of the revolution, was rewarded by that prince with a grant of a district as their own possession, and at the same time with the privileges of nobility. This grant was made by a public decree of Dec. 12, 1605, and was confirmed by the diet in 1613. Except the privilege of exemption from taxes, which Charles III. took away, the Haiducks enjoy all the rights of nobles to the present day. Their residence, the Haiduck district, remains independent of the country authorities, and is under the direct administration of the national government. The Haiduck district lies within the country of North Bihar, between the Theiss and Transylvania, has an area of about 594 sq.m., and six principal Haiduck towns. The capital of the district used to be Böszörmény. The total pop. is about 63,000, all Magyars, and for the most part belonging to the Reformed church. In 1876 this district was incorporated with portions of two adjoining districts into a new administrative division (called *Haidukencomitat*) with Debreczin for its capital. In course of the present century, the name Haiducks has begun to be applied to the macers of Hungarian courts and the halberdiers of the Hungarian magnates; also to the lackeys and other attendants in German courts.

HAIGHT, BENJAMIN I., S.T.D., LL.D., b. New York, 1809; graduated at Columbia college and the general theological seminary in New York. He was ordained in that year and chosen rector of St. Peter's (Prot. Epis.) church. In 1854 he went to Cincinnati, and was three years rector of St. Paul's. In 1857 he was called to All Saints, church, New York, remaining there until 1846. He was for 18 years professor of pastoral theology and pulpit oratory in the general theological seminary. In 1855 he was sent to Trinity parish, and in 1874 was chosen assistant rector. He has been a delegate in three general conventions. In 1873 he was chosen bishop of Massachusetts, but ill health compelled him to decline the office. For 20 years he was secretary of the diocese of New York, and in the meantime held various other honorable offices, among then that of trustee of Columbia college.

HAILES, LORD. See DALRYMPLE, Sir DAVID, *ante*.

HAIL, HAILSTORM. The word hail, in English, is unfortunately used to denote two phenomena of apparently different origin. In French, we have the terms *grêle* and *grésil*—the former of which is hail proper; the latter denotes the fine grains, like small shot, which often fall in winter, much more rarely in summer, and generally precede snow. The cause of the latter seems to be simply the freezing of rain-drops as they pass in their fall through a colder region of air than that where they originated. We know by balloon ascents and various other methods of observation, that even in calm weather different strata of the atmosphere have extremely different temperatures, a stratum far under the freezing-point being often observed between two others comparatively warm.

But that true hail, though the process of its formation is not yet perfectly understood, depends mainly upon the meeting of two nearly opposite currents of air—one hot and saturated with vapor, the other very cold—is rendered pretty certain by such facts as the following: A hailstorm is generally a merely local phenomenon, or at most, ravages a belt of land of no great breadth, though it may be of considerable length. Hailstorms occur in the greatest perfection in the warmest season, and at the warmest period of the day, and generally are most severe in the most tropical climates. A fall of hail generally *precedes*, sometimes accompanies, and rarely, if ever, follows a thunder-shower. A common idea, which has found its way, as many popular prejudices continually do, into scientific treatises, assigns electricity as the origin of hail. But all observation, rightly interpreted, seems to show that electricity and hail are *results* of the same combination of causes.

When a mass of air, saturated with vapor, rising to a higher level, meets a cold one, there is, of course, instant condensation of vapor into ice by the cold due to expansion; at the same time, there is generally a rapid production of electricity, the effect of which upon such light masses as small hailstones is to give them in general rapid motion in various directions successively. These motions are in addition to the vortex motions, or eddies, caused in the air by the meeting of the rising and descending currents. The small ice-masses then moving in all directions impinge upon each other sometimes with great force, producing that peculiar rattling sound which almost invariably precedes a hail-shower. At the same time, by a well-known property of ice (REGELATION), the impinging masses are frozen together; and this process continues until the weight of the accumulated mass enables it to overcome the vortices and the electrical attractions, when it falls as a larger or smaller hailstone. On examining such hailstones, which may have any size from that of a pea to that of a walnut, or even an orange, we at once recognize the composite character which might be expected from such a mode of aggregation. Hailstones are reported to have fallen in tropical countries sometimes as large

as a sheep, sometimes as large as an ox, or even an elephant! But it is probable that the aggregation in these cases was produced by regelation at the surface of the earth, when a series of large masses had impinged on each other, having fallen successively on the same spot. Whether this be the true explanation or no, it is certain that in British India, at the warmest season, hailstones have remained of considerable size for many days after their fall. A curious instance of the fall of large hail, or rather ice-masses, occurred on one of her majesty's ships off the cape in Jan., 1860. Here the stones were the size of half-bricks, and beat several of the crew off the rigging, doing serious injury.

We may conclude by a description (taken from *Mem. de l'Acad. des Sciences*, 1790) of one of the most disastrous hailstorms that has occurred in Europe for many years back. It illustrates very happily the greater part of what we have said about the origin of this meteor. This storm passed over parts of Holland and France in July, 1788. It traveled *simultaneously* along two lines nearly parallel—the eastern one had a breadth of from half a league to five leagues, the western of from three to five leagues. The space between was visited only by heavy rain; its breadth varied from three to five and a half leagues. At the outer border of each, there was also heavy rain, but we are not told how far it extended. The general direction of the meteor was from s.w. to n.e. The length was at least a hundred leagues; but from other reports, it may be gathered that it really extended to nearly two hundred. It seems to have originated near the Pyrenees, and to have traveled at a mean rate of about sixteen and a half leagues per hour towards the Baltic, where it was lost sight of. The hail only fell for about seven and a half minutes at any one place. The hailstones were generally of irregular form; the heaviest weighed about eight French ounces. This storm devastated 1039 parishes in France alone, and an official inquiry fixed the damage at about 24,690,000 francs—nearly a million of English money.

HAIMHALDA'RE, an old Scotch law-term, meaning to recover one's goods and bring them home again—now disused.

HAIM'SUCKEN, or HAMESUCKEN, a Scotch law-term, denoting the offense of feloniously assaulting a man in his own house or lodgings. This was an aggravation of the ordinary offense of assault. It was not so in England, where there is no peculiar name to distinguish this from other assaults.

HAIMU'RA, *Erythrinus macrodan*, a large fresh-water fish of Guiana, highly esteemed for the table. It belongs to a small family of fishes, *erythrinidæ*, exhibiting relations to the herring, salmon, and carp families. It is sometimes 4 ft. in length. The teeth are large, and so formidable, that instances are said to have occurred of a captured haimura biting off a man's hand. The haimura abounds particularly in the upper parts of the rivers of Guiana.

HAINAN', a large island in the China sea, constituting a department of the province of Kwang-tung, is about 180 m. long and 101 broad, and is separated from the mainland by a strait 15 m. wide, filled with shoals and reefs. Its principal city, Kiung-chau, in 20° 7′ n. lat., and 110° 15′ e. long., is the most southern of the ports open for trade. The interior of the island is mountainous, and the inhabitants give but a partial submission to the Chinese. The pop. is about 1,500,000. Its productions are rice, sweet potatoes, sugar, tobacco, fruits, timber, and wax. Typhoons or cyclones are frequent off the coast during the summer months. Whaling is pursued here with success by Chinese fishermen.

HAINAN (*ante*), forms a *foo* or department of the Kwang-tung, though strictly only a portion of the island, is under Chinese administration, the remainder being still unsubjugated. The capital, Kiung-chow-foo, situated in the n. some 10 *li* (3 m.) from the coast, is well-built and compact, with a pop. which has been over-estimated at 200,000, but C. C. Stuhlmann in the *Globus*, 1876, gives the correct figure as 100,000. The principal industrial products of the capital are carved articles in cocoa nut and scented woods. In 1630 it was the seat of a Roman Catholic mission, under Benoit de Mathos, a Portuguese Jesuit, and the old cemetery contains about 113 Christian graves. The port of Kiung-chow-foo at the mouth of the river is nearly dry at low water, and is called simply *hoi how*, i.e., seaport.

The two towns are united by a good road, along which a large traffic is maintained. The net value of the trade of the port, that is the foreign and native imports, less the re-exports and native imports of local origin, rose from 684,772 taels in 1876 to 1,215,056 in 1878. Out of 182 vessels engaged in the foreign trade in 1878, with a tonnage of 87,290 tons, 152 were British, with a tonnage of 70,078 tons. The exports comprise leather, hides, skins, tallow, sugar, to the value of 204,427 taels; hemp, galangal, lung-ngan pulps, grass, cloth, and silk and sesamum, to the value of 41,936 taels. The pop. of the entire island is estimated at 2,500,000. At its first conquest 23,000 families were introduced from the mainland. In 1300 the Chinese assign it 166,257 inhabitants; in 1370, 291,000; in 1617, 250,524, and in 1835, 1,350,000.

HAINAUT, FRENCH. See the French department of NORD.

HAINAUT, or HAINAULT (Ger. *Hennegau*), a frontier province of Belgium, is bounded on the e. by the province of Namur, on the n. by the provinces of Brabant and e. and

w. Flanders, and on the s.w. by France. Area, 1424 sq.m.; pop. '74, 949,346. The surface consists in the n. and w. of flat and fruitful plains, the s. is occupied by the forest of Ardennes. Hills occur only in the s.e., and consequently the course of most of the rivers is toward the w. and n.w. The principal rivers are the Haine—from which the province has its name—the Scheldt, the Dendre, and the Sambre, the last a tributary of the Meuse. The soil is highly productive; wheat and flax are very extensively grown. Excellent breeds of horses, horned cattle, and sheep are reared. Toward the w., in the neighborhood of Mons, are very extensive coal-fields. There are in this district more than 200 coal-pits, from which about 2,000,000 tons of coal are annually exported. Iron is also produced in considerable quantity, and marble, building stone, and limestone are quarried. Linen, porcelain, and pens are extensively manufactured.

HAI'NBURG, or HAIMBURG, a small but old and interesting t. of Austria, in the crown-land of Lower Austria, is situated on the right bank of the Danube, 27 m. e.s.e. of Vienna, and 2 m. from the Hungarian frontier. It is surrounded by old walls, pierced by two castellated gates, and contains an imperial tobacco factory, the largest in the country, an institution for cadets, and an infantry school. Among its more notable edifices are the town-house, with a Roman altar, a tower, called the Roman tower, with the supposed statue of Attila, and on the summit of the Castle Hill the remains of an old castle, destroyed in 1596, when its powder-magazine was struck by lightning. Pop. '69, 4,178.

Many consider Hainburg the ancient *Carnuntum*, once an important Roman stronghold and the station of the Danubian fleet, and which rose to its highest prosperity during the reign of M. Aurelius. However this may be, it is certain that considerable remains of the fortifications of *Carnuntum* are found in the immediate vicinity. A Roman aqueduct still supplies the market of Hainburg with water. In the *Nibelungenlied*, the castle of Hainburg is called Heimburc, the border fortress of the country of the Huns. It was forcibly torn from the Hungarians in 1042 by the emperor Henry III., and afterwards it became a residence of the Austrian princes.

HAINICHEN, a t. of Saxony, 28 m. w.s w. of Dresden, on a tributary of the Mulde. Wool-spinning, weaving, and the manufacture of cloth are carried on. Pop. '75, 8,468.

HAIR, including bristles, wool, fur, etc., is a modification of the epidermis (q.v.), and consists essentially of nucleated particles. An ordinary hair consists of a *shaft* and a *bulb*. The shaft is that part which is fully formed, and projects beyond the surface. If we trace it to the skin, we find it rooted in a follicle in the cutis or true skin, or even in the connective or cellular tissue beneath it. This follicle is bulbous at its deepest part, like the hair which it contains, and its sides are lined with a layer of cells continuous with the epidermis. The layer of epidermic cells, according to Todd and Bowman, (*Physiological Anatomy*, vol. i. p. 417), "resembles the cuticle in the rounded form of its deep cells, and the scaly character of the more superficial ones, which are here in contact with the outside of the hair. The hair grows from the bottom of the follicle, and the cells of the deepest stratum gradually enlarge as they mount in the soft bulb of the hair, which owes its size to this circumstance. If the hair is to be colored, the pigment cells are also here developed. It frequently happens that the cells in the axis of the bulb become loaded with pigment at one period, and not at another, so that, as they pass upwards in the shaft, a dark central tract is produced, of greater or less length, and the hair appears here and there to be tubular. The shaft is much narrower than the bulb, and is produced by the rather abrupt condensation and elongation into the hard fibers of the cells, both of those which contain pigments and those which do not." If the tissue is softened by acetic acid, these fibers may be readily seen under the microscope; they seem to be united into a solid rod by a material similar to that which cements the scales of the cuticle. The central cells, when filled with pigment, have less tendency to become fibrous than those lying more externally; and hence some writers have described the center as a *medulla*, in distinction from the more fibrous part of the shaft, which they term the *cortex*. (This tubular character is constant in the hair of many animals, but is very variable in human hair, and even in the same hair at different parts of its length.) The term *cortex* or *bark* is more correctly applied to the single outermost layer of cells which overlap one another, and cause the sinuous transverse lines which are seen on examining a hair under the microscope.

In some hairs, especially those which act as tactile organs in some of the lower animals (as, for instance, in the whiskers of the various cats), a true papilla, furnished with nerves and capillaries, projects into the hair-bulb, and an approach to this papillary projection may often be seen in human hairs.

The hairs, like epidermis, are thus seen to be organized, and to maintain a vital, although not usually a vascular connection with the body. The color of hair seems to depend on the presence of a peculiar oil, which is of a sepia tint in dark hair, blood-red in red hair, and yellowish in fair hair. This oil may be extracted by alcohol or ether, and the hair is then left of a grayish yellow tint. The chemical composition of hair closely resembles that of horn, and will be described in the article HORNY TISSUES.

Hair is extremely strong and elastic, and hence its uses for the construction of fishing-lines, the stuffing of cushions, balls, etc. Amongst its other physical properties, we

may mention that, when dry and warm, it is easily rendered electrical, and that it is extremely hygroscopical; readily attracting moisture from the atmosphere, and no doubt from the body also, and yielding it again by evaporation when the air is dry. Hairs elongate very considerably when moist—a property of which Saussure availed himself in the construction of his hygrometer, in which a human hair, by its elongation and contraction, according as the atmosphere is moist or dry, is made to turn a delicate index.

Hairs are found on all parts of the surface of the human body, except the palms of the hands and the soles of the feet; they differ, however, extremely in length, thickness, shape, and color, according to situation, age, sex, or race. The differences dependent on situation, age, and sex, are so obvious that we shall pass them over without notice, and proceed to the most important differences dependent on race. With respect to the quantity of hair that grows on the human body, there are great differences in different races. The Mongols, and other northern Asiatics who are similar to them, are noted for the deficiency of their hair and for scanty beards, and the same character is ascribed to all the American nations; while, on the other hand, among the *Ainos*, or in the Kurilian race, there are individuals who have the hair growing down the back, and covering nearly the whole body. The northern Asiatics and the Americans have generally straight lank hair, while Europeans have it sometimes straight and flowing, and occasionally curled and crisped. Negroes present every possible gradation, from a completely crisp, or what is termed woolly hair, to merely curled, and even flowing hair; and a similar observation holds regarding the natives of the islands in the great Southern ocean. As there is a generally diffused opinion that the head of the African is covered with a species of wool instead of with true hair, we may mention that all true wools which have been examined microscopically (as merino wool, the wool of the tiger, rabbit, bear, seal, and wolf-dog, which were investigated by the late Mr. Youatt), present a more or less sharply serrated or jagged surface, while hairs present merely an imbricated appearance. "Hairs of a negro, of a mulatto, of Europeans, and of some Abyssinians, sent to me (says Dr. Prichard) by M. d'Abbadie, the celebrated traveler, were, together with the wool of a southdown sheep, viewed both as transparent and opaque bodies. The filament of wool had a very rough and irregular surface; the filament of negro's hair, which was extremely unlike that of wool and of all the other varieties mentioned, had the appearance of a cylinder, and the coloring matter was apparently much more abundant than in the others." It is in consequence of the above named difference between hair and wool that although the former will entangle to a certain degree, it will not felt into a compact mass, which is the characteristic property of good wool.

The grayness of hair in advanced life results from a deficient secretion of pigment. Well-authenticated cases are on record in which the hair has grown gray or white in a single night, from the influence of fear, distress, or any variety of strong mental excitement. It is not easy to explain this phenomenon. Vauquelin suggested that it might result from the secretion at the bulb of some fluid (perhaps an acid), which percolates the hair, and chemically destroys the coloring matter.

The chief use of the hair, and particularly of the fur of various mammals which is especially developed in the winter, is to protect the body from external cold. Except on the scalp, and on the throat, this cannot be considered as applying to man. What, then, are the uses of the hair on the face, and especially on the upper lip? We shall answer this question with an extract from an article "On the Use of the Hair" in *The Lancet* for Nov. 3, 1860: "Mr. Chadwick, who has done so much for sanitary reform, tells us that he was once very much struck by seeing some blacksmiths who wore beards with their mustaches discolored by a quantity of iron dust which had accumulated amongst the hairs. Turning it over in his mind, it struck him that had not the dust been so arrested by a natural respirator, it must have found its way into the lungs, where it could not have been otherwise than productive of evil consequences. He hence rightly advised that the razor should be discarded by laborers in all dusty trades —such as millers, bakers, masons, etc.; by workmen employed in grinding iron, or steel; and by travelers on dusty roads. In hot, sandy countries, the use of the beard is soon discovered; and travelers in Syria and Egypt find it necessary to defend their mouths against the entrance of the hot air of the desert. But not against dust alone is the facial hair a protection; it is the best barrier against cold air, biting winds, and wheezy fogs that a Northman can obtain. . . . . According to Mr. Chadwick, the sappers and miners of the French army, who are remarkable for the size and beauty of their beards, enjoy a special immunity against bronchial affections." In corroboration of the last-named fact, we may mention another of a still more striking character. During the long-continued search for Franklin's expedition, a transport vessel, the *North Star*, was frozen up during one of the severest arctic winters on record, in Wolstenholme sound. The crew maintained their health perfectly during all the trials to which they were exposed. On their return to England in the early summer, they shaved off the hair that had been growing around the mouth and throat for the last eight or nine months, and within a week *every man* was on the sick list with some form of bronchial or pulmonary disorder.

The length to which the hair of the head may grow normally, especially in women,

is very considerable. In the "Hair Court" of the international exhibition (1862), there was a beautiful specimen of jet-black hair (British, we believe,) measuring 74 inches.

Cases occasionally occur where there is an abnormal abundance of hair of considerable length in women, on parts where the hair is usually little more than down. A hairy lady, named Julia Pastrana, supposed to be a Mexican, was some years ago exhibited in London. Her embalmed body was exhibited also in that city in 1862, and we extract the following remarks from a memoir on her in *The Lancet* for May 3 of that year: "The ears, and all parts of the face except the eyes, were covered with hair of different lengths. The beard was tolerably thick, the hairs composing it being straight, black, and bristly, the part of it which grew on the sides of the chin hanging down like two plaits. . . . The upper portion of the back of the neck and the hinder surface of the ears, were covered with hairs. On the shoulders and legs, the hairs were as abundant as they are occasionally seen on very powerful men."

Dr. Chowne has described similar but less marked cases of hairy women in *The Lancet* for 1843.

HAIRBELL. See HAREBELL, *ante*.

HAIR-DRESSING. As a matter of convenience, as well as of taste and fashion, the dressing of the hair has received much attention in all civilized nations, ancient and modern. The growth of hair on the sides and lower part of the male face has caused some perplexity in management, and as a method of overcoming the difficulty, shaving has been resorted to, although at the sacrifice of what nature gives to distinguish the male from the female countenance, and also to protect the respiratory organs. See BEARD. The Jews, by their scriptural law, were enjoined not to shave. The Romans shaved, and so did their immediate successors, the Romanized Britons. The Saxons and Danes did not shave, and wore long hair. The Normans shaved, but they, too, adopted long hair as a fashion; and from them, and the more modern French, the courtiers and cavaliers of the 17th c. adopted the practice of wearing those flowing "love-locks" which excited the ire of the Puritans. It was, however, in the management of ladies' hair, that the art of the professional hair-dresser was in those times mainly exercised. In the 18th c., through the influence of French fashions, the dressing of hair, male and female, rose to a great pitch of extravagance and folly. The hair of a lady of fashion was frizzed up in convolutions and curls, decorated with ribbons, jewels, and feathers, and filled with pomatum and powder to a degree perfectly monstrous. As women of less exalted rank slavishly attempted to follow these absurdities, the business of dressing hair was extensively followed. The cost of a full dressing being, however, too high to be lightly incurred, often one dressing was made to suffice for a week or fortnight, during which period such care was taken to preserve the greasy fabric undisturbed, that it became the resort of insects, and how to extinguish these odious pests was in itself a matter of serious concern. From pressure of business, it frequently happened that, previous to balls, ladies' hair had to be dressed one or two days in advance; and to keep the head-dress uninjured, the lady sat in a chair perhaps two nights, instead of going to bed. The writer of this has conversed with a lady who in this manner sat up one night for the sake of her finely powdered and frizzed-up hair. A taxation on hair-powder, along with the simplification of fashions consequent on the French revolution, not only expelled hair-powder and perruques, but brought the profession of hair-dresser within reasonable bounds. As regards ladies' hair, fashion is constantly altering; and at present the chignon, consisting of cushions at the back or top of the head, and covered with hair, is gradually giving way to a system of coils and plaits. With respect to men's hair, short cutting is now universal, and any indulgence in long hair behind is thought to mark a degree of slovenliness or whimsicality of fancy. Pursued as an ordinary business in England and continental countries, hair-dressing in the United States is entirely resigned to men of color, and in connection with many of the hotels they are provided with workrooms.

Innumerable are the oils, essences, and pomades which are vended for the hair, on the assumption that they improve and nourish it. According to the experience of the best perruquiers, all such applications, any unguent in particular, and however sanctioned by tradition, are injurious. In ordinary circumstances, regular but not violent brushing is preferable for maintaining cleanliness and glossiness. When the head becomes affected with scurf which the brush does not remove, let the following efficacious and simple method of purification be adopted. Beat up an egg, and rub it well in all over the head; then pour over it warm water, which, while removing the egg, will likewise carry away all the scurf; lastly, dry thoroughly with a cloth. The head may be hung over a small tub during the process. After this, the hair will be very clean, and will take on a fine gloss with a brush. On no account use sharp combs to clean the head, for they are apt to irritate the roots of the hair, and after all fail in the desired object.

HAIR DYES. Various means have been adopted for changing the natural color of the hair to a more favored one, and for hiding the approaches of age, as indicated by the presence of gray hairs. These usually consist in washing the hair with a solution of some metallic salt known to have the effect of darkening its color. These are the salts or oxides of silver, mercury, lead, and bismuth. The most perfect mode of dyeing

the hair, however, is that of previously preparing it by a complete soaking with a solution of sulphide of potassium; the strength of this solution must depend on the depth of tint intended to be given; the stronger the solution, the darker the color will be. When thoroughly wetted, the hair is allowed to dry partially; and whilst still damp, it is to be again thoroughly wetted with a solution of nitrate of silver, also proportioned in strength by the same rule as in the case of the solution first applied. This makes a very permanent dye, which only requires renewing as the new growth of hair becomes conspicuous. The fashion of dyeing the hair is very ancient, and belongs as much to savage as to civilized nations; but in the case of the former, vegetable dyes have been chiefly used; and the ladies of China and other eastern countries also resort to the same: the juice of the petals of hibiscus trionum, the bladder-ketmia, and probably other species of hibiscus, is in general use with them.

The detection of stained hair is sometimes an object of medico-legal investigation. Lead may be detected by boiling the hair in dilute nitric acid, and then applying the tests for lead (q.v.) to the acid solution; while the presence of silver may be shown by digesting the hair in dilute hydrochloric acid or chlorine water, when the resulting chloride of silver may be dissolved out with a solution of ammonia, and submitted to the ordinary tests for silver (q.v.).

HAIR GRASS, *Aira*, a genus of grasses, having loosely panicled flowers, and two unequal glumes containing two perfect florets, each with two thin membranous paleæ, of which the outer is generally awned near the base. The species are natives of temperate and cold climates. A number of them are natives of Britain, some of which are of very humble growth, and are chiefly found in moors, sandy pastures, and other situations where the soil is unfertile. The TUFTED HAIR GRASS, or TURFY HAIR GRASS. (*A. cæspitosa*), common in better pastures and meadows, is a beautiful grass when in flower, but forms coarse tufts; has very rough leaves, which, if drawn roughly across the hand, inflict considerable wounds, whence the plant sometimes receives the name of "cutting grass." It is rejected by cattle, if other herbage is within their reach. It attains a height of 2 to 4 ft., and is sometimes used for thatching ricks of hay or corn, and in some places for making mats. It grows luxuriantly in moist situations, and indicates a soil in want of draining. It is sometimes tolerated, in order to add to the bulk of *bog hay* in moorish grounds, but is carefully extirpated wherever agricultural improvement takes place. For its extirpation, drainage is requisite above all things; but the digging out of the tufts is also practiced, and other grasses are sown instead. This grass is, however, sometimes sown to form cover for game, particularly hares; and in marshy situations, for snipes and wild fowl. It is the *windiestrae* of the Scotch. Allied to the genus *aira* is *catabrosa* (q.v.).

HAIR MANUFACTURES. These consist of fabrics woven or felted of various kinds of hair; brushes made of particular kinds of hair; and ornamental hair-work.

Woven Fabrics.—The most important in this country is the horse-hair cloth so extensively used for covering the seats of chairs, couches, and other articles of furniture; this is made of the long hair of horses' tails. As the hair is of such various colors, it is necessary to dye all the darker shades so as to produce a uniform glossy black; this is done by logwood and sulphate of iron (copperas) in the following manner: The hair must first be cleansed and deprived of its grease by soaking it in lime-water for a day; it is then transferred to the dye-vat, which is thus prepared for a hundredweight of hair. Sufficient water to fill a boiler large enough to receive the hair, is boiled with 60 lbs. of cut logwood for three hours, after which it is suffered to cool, when 2 lbs. of copperas are added. This constitutes the bath, as it is called; and the hair, after being removed from the lime-water, and well washed in soft-water, either rain or river, is immersed in it for 24 hours; it is then removed, and again washed, to free it from the superfluous dye, dried, and shaken out ready for use. Perfectly white horse-hair can be dyed various colors, and is well adapted to receive the brighter ones, hence it has been much used of late years to produce ornamental hair-cloth, which are in great request abroad, especially in South America. The weaving of horse-hair cloth is different from that of other tissues, in consequence of the shortness of the hair, which, for the same reason, can only be used for the weft except in the open or sieve cloth which is only made in small squares for the sieve-makers. Each hair has to be worked singly, and the loom requires two persons to work it. The warp used is either worsted, cotton, or linen yarn, generally the last. The hairs for the weft are kept wet by the side of the weaver, and are handed to him one by one. He receives them on a kind of hook at the end of his shuttle, the hook catching a knot tied by the attendant child who hands the hair. In other respects, the weaving differs little in its general character from that ordinarily employed for other fabrics. When the web is completed, it is dressed by calendering, which gives it a smooth and glossy surface. It is to be regretted that the popular taste in Great Britain does not turn to the ornamental kinds, which are not only very beautiful, but are durable and easily cleaned. The true crinoline cloth, for ladies' dresses, etc., was at first made of horse-hair, usually the white kind; but the immense demand led to the introduction of Agave or Aloe fiber, which soon supplanted it for most purposes, except the manufacture of bonnets, for which it is largely employed both as a material for the body of the bonnet and also as a trimming. The trade in crinoline

trimming in Switzerland and France is large, and considerable quantities are imported into Britain. Horse-hair is twisted into thick yarn, and woven into sacking in the ordinary way, in Anatolia and Roumelia; and cow-hair is worked up into a rough yarn, and is woven into carpets in Germany; and in Norway is made into socks by the peasants. Pig's hair is similarly employed in China; and amongst the natives of the Hudson's Bay territories, dog's hair is used for the same purpose. The goat's hair of Thibet and Persia, and the camel's hair used in weaving, belong rather to the true wools, and will be treated of under WOOL.

The difference between hair and wool depends chiefly upon the greater or less smoothness of the surface of each fiber, hence the hairs which are smoothest cannot easily be felted, for if brought into contact, they have no projections of the surface to keep them from slipping away from each other; but some of the hairs proper, by a little preparation, may be so roughened as to fit them for felting. Thus, coney wool, or the hair of rabbits and hares, if properly moistened with a solution of nitrate of mercury, loses its straight and smooth character in drying, and is then readily felted.

The shorter kinds of horse-hair from the manes and tails, also cow-hair and the softer kinds of pig-hair, are twisted into ropes, which, after being boiled and then thoroughly dried in an oven, are pulled to pieces. The hair retains the twist given it, and is then used for stuffing seats of chairs, etc.

Brushes of hair are of various kinds; some are made of the stiff hairs from the backs of pigs, and others are made of the soft hairs of the camel and other animals. The hairs for the first kind are called bristles (see BRISTLES), which constitute an important trade with foreign countries. They are chiefly used in the manufacture of hair and clothes brushes, tooth and nail brushes, house-sweeping brooms, the larger kinds of painters' brushes, etc. The second kind are chiefly employed in the manufacture of the fine brushes or hair-pencils used by painters and artists. The best bristles come from Russia. Besides the camel, hairs are yielded for this purpose by the badger, sable, goat, dog, etc. In both cases, the sorting of the hairs into lengths is a very important and troublesome matter. Generally, it is done by placing the hairs in small boxes (with the tips upward), sufficiently deep to keep them upright; and the sorter then, with nice eye and hand, selects the sizes, by pulling out all the longest, as they overtop the others; then the next size, and so on. This, in the case of the hairs for artists' pencils, is an extremely difficult operation, as great exactness is necessary. Several attempts have been made, in Russia and in this country, to sort bristles by machinery, and one person has succeeded in doing so with a rude wooden machine. But the really successful manufacture of a machine which can be made generally available, belongs apparently to Mr. W. S. Yates of Leeds, who exhibited in the international exhibition (1862) a machine of great beauty and simplicity, which sorts into ten sizes, and with great rapidity. Most hair-brushes are required to have the bristles or hairs placed with great evenness, so as to form a flat surface outward; but in the case of those which are called artists' and painters' pencils, their value consists in having a fine point, so that the selection of the hairs so as to insure this, is a work of difficulty. The first step is, after selecting a small quantity, to see that all the tips are in one direction; this is usually done in removing them from the skin, a pair of flat-bladed pincers being employed to hold each cut of hairs, whilst the knife or shears severs them from the skin. They are then placed in small shallow tin boxes, with the tips upward; and the box being carefully shaken, and gently struck on the bottom until the hairs have completely arranged themselves in an upright position, they are then picked out, as before described; each size is placed by itself; and the brushmaker, according to the kind of pencil he is making, takes the proper size, and separating a sufficient number, they are placed upright in another little tin box, but now with the root-end of the hairs uppermost, so as to insure the tips being perfectly even, which is further insured by gently tapping the box as before. Fine thread is then looped round the base of the little bundle of hairs, and securely tied; sometimes more than one ligature is thus made; and the brush, now so far completed, only requires its handle of quill or wood, according to its size and character. Artists' pencils being of various sizes, and many extremely small, several kinds of quills are required. These are obtained from several birds, as the swan, goose, duck, fowl, pigeon, lapwing, and even such small ones as the lark and thrush. Previous to receiving the brush, the quills, besides being cut to the required lengths, have to be further prepared by soaking in water, to prevent them splitting, as the thick end of the brush is being pushed down from the wider to the narrower end. They also contract somewhat in drying, and consequently hold the brush very tightly.

Ornamental hair-work consists chiefly of the human hair plaited into chains, guards, etc., or worked up into various other fanciful devices, as souvenirs, etc. Under this head we may also mention those manufactures of the human hair which are either required to supply a personal deficiency, or to meet the demands of fashion. To the former class belong the wig, the front, and other imitations of the natural covering of the human head; and to the latter, a variety of contrivances, whose mysterious names are only known to barbers and ladies' maids, for the purpose of giving an appearance of greater abundance to the natural supply.

The wig, like all other portions of human attire, has undergone a great many variations in fashion. In the present day, the great object is, in the first place, as far as

possible, to imitate nature, and deceive the eye; and secondly, to produce wigs of extreme lightness—a full-sized peruke rarely being more than two or three ounces in weight. A full head of hair, from a young woman's head, will sometimes weigh five or six ounces. There are two heads of hair in the South Kensington museum, which are in the raw state as imported, and weigh together 11½ ounces.

The chief portion of the hair used in Great Britain is received through French dealers, who collect it from Holland and Germany, as well as from the various departments of their own country. The light colors are usually obtained from the former countries, and the dark shades from Brittany. This does not arise from the circumstance that these countries yield the finest heads of hair, but because the poverty of the people causes its sale to be a matter of importance, and the peculiar fashions of the country head-dresses render its loss of less consequence.

The wholesale price of long hair is from 30s. to 400s. per lb., and the peasants of France alone supply 20,000 lbs., of the value of £40,000. The average import, during four years from France, was 14,000 lbs., of the value of £28,000. Besides the imports from France, which chiefly comprise the darker colors, a considerable quantity comes from Germany, usually of light shades.

HAIR-POWDER, a pure white powder, made from pulverized starch, scented with violet or some other perfume, and at one time largely used for powdering over the head. The strange fashion of using hair-powder is said to have originated from some of the ballad-singers at the fair of St. Germain, in France, whitening their heads, to render themselves more attractive. Introduced into Great Britain, the fashion became universal among the higher and middle classes, and by ladies as well as gentlemen. To make the powder hold, the hair was usually greased with pomade, and accordingly the fashion was extremely troublesome. An act of parliament fixed that the fine dust of which the powder was composed should be made from starch alone; and we learn from the *Gentleman's Magazine*, that on Nov. 20, 1746, fifty-one barbers were convicted before the commissioners of excise at London, and fined £20 each, for having in their keeping hair-powder not made of starch, contrary to act of parliament; and on the 27th of the same month, forty-nine others were fined, for the like offense, in the same penalty. In 1795 a tax of a guinea (afterwards £1 3s. 6d.) was put on the use of hair-powder, and at one time yielded £20,000 per annum, but it had the effect of causing hair-powder to fall into general disuse. The French revolution, which overturned so many institutions, contributed also to the people of Europe returning to natural and unpowdered hair. When gentlemen first left off hair-powder with queues, they were considered very unfashionable; and the custom of having the hair cut short, which is quite universal at present, was then deemed vulgar. At the present day, powder continues to be used by some of the footmen of the nobility and higher ranks as part of their livery; and occasionally, at public or private *bals costumés*, ladies and gentlemen still appear with their heads powdered. The tax on hair-powder was done away with under 32 and 33 Vict. c. 14, the act which substituted a system of excise licenses for the former mode of collecting assessed taxes. At the time of its abolition, it was paid by about 800 persons, and yielded a revenue of about £1000 a year.

HAIRS, in botany, are very different from the hair of animals, although there is sometimes a considerable general resemblance, and the same purpose of protection from cold and from various atmospheric influences seems also to be sometimes served by them. They are produced by no special organ analogous to the bulbs from which the hairs of animals grow, but are composed of cellular tissue, arise from the epidermis, and are covered with extensions of the cuticle. Some hairs consist of a single elongated cell; some of several cells placed end to end. The gradations are quite indefinite between the most elongated hairs and the mere warts or rugosities which often appear on the surface of plants. In like manner, hairs pass into *bristles* (*setæ*) and prickles (*aculei*), which are merely stronger and harder hairs; but spines or thorns are totally different, arising from the wood of the stem or branch. Hairs are very often connected with *glands*, which are cells or clusters of cells, producing secretions; hairs often arise from glands, and then generally serve as ducts through which the secretion may pass: but hairs also often bear glands at their apex. Stinging hairs, as in nettles, *loasas*, and some *malpighias* (see these heads), are ducts, with venom-secreting glands at their base.

HAIR-SPRING. See BALANCE-SPRING.

HAIR-TAIL, *Trichiurus*, a genus of acanthopterous fishes, which, on account of their compressed and very elongated form, have been classed in the ribbon-fish family, but are otherwise allied to the mackerel, tunny, etc., and are therefore, in recent systematic works, referred to the family *scomberidæ*. The dorsal fin extends along the whole back, and is spiny throughout; there are no ventral fins, no anal fin, and no tail fin, the tail ending in a single elongated filament. One species, the SILVERY HAIR-TAIL (*T. lepturus*), sometimes called the blade-fish, is found in the Atlantic ocean, and has been cast on the shores of Britain, but is more common in warmer regions. It is called saber-fish in Cuba. It sometimes attains a length of 12 feet. Its flesh is good.—An East Indian species, the SAVALA (*T. savala*), is much esteemed for food, and commonly sold in the markets of India.

HAIR-WORM. See GORDIUS, *ante*.

HAJDUK, or HAIDUCK (from a Hungarian word meaning *drover, cowherd*), is the name for the population of a district in the eastern part of Hungary. The Hajduk are direct descendants of those warriors, who, during the long and bloody contest between the house of Hapsburg and the Protestant insurgents of Hungary, formed the nucleus of prince Stephen Bocskay's valiant armies. The Hajduk enjoyed privileges of nobility, and immunities from taxation ever since 1605, in which year the whole tract of land they are in possession of to the present day was given them by the above named munificent prince. Notwithstanding repeated attempts made by the Austrian government against their privileges, the Hajduk retained the peculiar organization of their district, until after the disastrous issue of the struggle in 1848–49, when they were reduced to the same level with the so-called hereditary provinces of the empire. At the dawn of the reformation, the Hajduk were among the first to adopt Calvin's doctrines (designated during a long period "the Hungarian Faith," in opposition to Luther, whose followers were chiefly among the Slaves of Upper Hungary). The Hajduk are almost exclusively addicted to agriculture, and with the simplicity of manners unite all the qualities which distinguished their ancestors. Their total number amounts to 70,000, forming six "towns." The political chief of the district bears the title of captain.

HAJILIJ, or BITO-TREE, *Balanites Ægyptiaca*, a tree of the natural order *amyridaceæ*, a native of Egypt and of central Africa, cultivated for its fruit, a drupe, which is edible, and from the seeds of which a fixed oil is expressed, called *zachun*. So much is this tree valued in central Africa, that there is a common proverb to the effect that a milch cow and a bito-tree are the same. (Barth's *Travels*.)

HAJIPUR, a t. in Bengal on the Gandak near its confluence with the Ganges, said to have been founded about 500 years ago by Haji Ilyas, the supposed ramparts of whose fort are still visible. Hajipur figures conspicuously in the history of the struggles between Akbar and his rebellious Afghan governors of Bengal, having been twice besieged and captured by the imperial troops, in 1572 and again in 1574. Its command of water traffic in three directions makes the town a place of considerable commercial importance. Within the limits of the old fort is a small stone mosque, very plain, but of peculiar architecture, and attributed to Haji Ilyas. Two other mosques and a small Hindu and Buddhist temple are in the town or its immediate vicinity. Beside the ordinary courts, the town contains a school, post-office, charitable dispensary, and distillery. Pop. '72, 22,306.

HAJJ (HAJI, HAGGE), (Heb. *Hag*. one of the three festivals appointed to the Jews for the purpose of pilgrimage to Jerusalem), Arab. pilgrimage, emphatically pilgrimage, to the Kaaba (q.v.) or temple of Mecca, which every Mohammedan, male or female, whose means and health permit, is bound to perform, once at least in his life, otherwise, "he or she might as well die a Jew or a Christian." Mohammed, after many fruitless attempts to abolish altogether the old custom of pilgrimage—prevalent among most peoples in ancient, and some even in modern times, and perhaps arising from an innate, instinctive, traveling propensity, but is not unfrequently fraught with mischievous consequences—was compelled finally to confirm it, only taking care to annul its idolatrous rites, and to destroy the great number of ancient idols around Mecca. The 12th month of the Mohammedan year, the Dsul Hajjeh, is the time fixed for the celebration of the solemnities, and the pilgrims have to set out for their journey one or two months before (in Shawâl or Dhulkada), according to the respective distances they have to traverse. They first assemble at certain variously appointed places near Mecca, in the beginning of the holy month, and the commencement of the rites is made by the male pilgrims here first putting on the Ihrâm or sacred habit, which consists of two woolen wrappers—one around their middle, the other around their shoulders; their head remains bare, and their slippers must neither cover the heel nor the instep. It is enjoined that the pilgrims, while they wear this dress, should be particularly careful to bring their words and thoughts into harmony with the sanctity of the territory they now tread, a territory in which even the life of animals is to be held sacred from any attack. Arrived at Mecca, the pilgrims proceed at once to the temple, and begin the holy rites there by walking first quickly, then slowly, seven times round the Kaaba, starting from the corner where the black stone is fixed (Tawaf). This ceremony is followed by the Sai, or running, likewise performed first slowly, then quickly, between the two mounts Safâ and Merwa, where, before Mohammed's time, the two idols Asaf and Nayelah had been worshiped. The next rite takes place on the ninth of the Dhulhajja, and consists in the Wukuf or standing in prayer on the mountain of Arafat, near Mecca, till sunset. The whole of the succeeding night in spent in holy devotions at Mogdalifa, between Arafat and Mina. The next morning, by daybreak, the pilgrims visit the Masher-al-Haram, the sacred monument (a place where the prophet stood so long in prayer that his face began to shine), and then proceed to the valley of Mirra, where they throw seven (or seventy) stones at three pillars, for the purpose of putting the devil to flight. The pilgrimage is completed with the slaughtering of the sacrifices on the same day and in the same place. The sacrifice over, they shave their heads and cut their nails, burying the latter on the same spot. They then take leave of the Kaaba, and, taking with them some sacred souvenirs, such as dust from the prophet's tomb, water from the well Zemzem,

etc., they proceed to their homes. The return of the holy caravans is watched everywhere with the most intense anxiety, and is celebrated with great pomp and rejoicings. Henceforth, the pilgrim never omits to prefix the proud name of Hajji to his name. It is permitted that those who, through bodily infirmity, are incapacitated from performing the holy journey themselves, may send a substitute, who acts as their representative in almost every respect, but this substitute has no share whatever in the merits and rewards belonging to the Hajj.

HAKE, *Merlucius*, a genus of fishes of the cod family (*gadidæ*), having a flattened head, an elongated body, two dorsal fins, of which the first is short, and the second very long, one very long anal fin, and the mouth destitute of barbels. One species, the COMMON HAKE (*M. vulgaris*), is found in the British seas, in those of the n. of Europe, and in the Mediterranean. It is sometimes 3 or 4 ft. in length; and is of a whitish color, grayish on the back. It is a very voracious fish, devouring great numbers of herrings and pilchards; hence it is frequently called the *herring hake*. It is a coarse fish; its flesh white and flaky; but it is important as an article of human food and of commerce; being salted and dried in the same manner as cod and ling, in common with which it receives in this state the name of *stock-fish*. It is generally taken by lines, like cod and ling. In the spawning season, when it keeps near the bottom, it is sometimes caught by trawl-nets.—Other species of hake are found in high southern latitudes.

HAKIM BEN ALLAH, or BEN HASHEM, called Mokanna (the veiled), or Sagende Nah (moon-maker), the founder of an Arabic sect who first appeared in the 8th c., during the reign of Mahadi, the third Abassidian caliph, at Neksheb, or Meru in Khorassan. Hakim is said to have commenced his extraordinary career as a common soldier, but to have soon been promoted to a captaincy, and finally to have put himself at the head of a band of his own. In a fight, an arrow pierced one of his eyes, and in order to hide this deformity, he henceforth constantly wore a veil, a habit attributed by other writers (Rondemir, etc.) to a desire to conceal his extraordinary ugliness—by his own followers, however, to the necessity of shrouding the dazzling rays which issued from his divine countenance from the eye of the beholder. Hakim set himself up as god. He had first, he said, assumed the body of Adam, then that of Noah, and subsequently of many other wise and great men. The last human form he pretended to have adopted was that of Abu Moslem, a prince of Khorassan. Thabari sees in this idea of metempsychosis the Jewish notion of the Shekinah—the divinity resting on some one chosen person or place and concludes that Hakim may have been a Jew. He appears to have been well versed in the art of legerdemain and "natural magic," principally as regards producing startling effects of light and color. Among other miracles, he for a whole week, to the great delight and bewilderment of his soldiers, caused a moon or moons to issue from a deep well; and so brilliant was the appearance of these luminaries, that the real moon quite disappeared by their side. Hakim found many adherents; and his little band increased so rapidly, that ere long he was able to seize upon several fortified places near the cities of Neksheb and Kesh. Sultan Mahadi marched against him, and after a long siege took the last stronghold in which he had fortified himself, together with the remnant of his army. Hakim, however, having first poisoned his soldiers with the wine of a banquet, threw himself into a vessel filled with a burning acid of such a nature that his body was entirely dissolved, and nothing remained but a few hairs, in order that the faithful might believe him to have ascended to heaven alive. Some remnants of his sect still exist, and their outward distinguishing badge is the white garb, which they wear in memory of the white garb worn by their divinity, as a standing token of opposition to the black color adopted by the Abassidian caliphs. Hakim has furnished the subject of many romances, of which the one contained in Moore's *Lalla Rookh* is the most brilliant and best known.

HAKLUYT, or **HACKLUYT**, RICHARD, an English author, was b. in 1553. While at Westminster school he eagerly perused narratives of voyages and travels, and continued this course at Christ-church, Oxford, whither he proceeded in 1575. Being appointed lecturer on geography or cosmography in that university, he introduced the use of globes and other geographical appliances into English schools. Private individuals, as well as commercial companies and towns, consulted him respecting nautical enterprises. In the year 1584 he went as chaplain to the English embassy to Paris, where he had Laudonnière's manuscript narrative of the discovery of Florida printed, first in French and afterwards in English, at his own expense. On his return to England, with the assistance of sir Walter Raleigh, he began to collect materials for the history of the discoveries made by his countrymen. He published the fruits of his researches, in notices of more than 200 voyages, under the title *Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation*, (Lond. 1589; new edit., 5 vols. Lond. 1809–12). Government rewarded him by bestowing upon him a prebend in Westminster abbey, and a living in Suffolk. A work entitled *A Selection of Curious, Rare, and Early Voyages and Histories of Interesting Discoveries*, etc., chiefly published by Hakluyt, or at his suggestion, but not included in his celebrated compilation (4to, Lond. 1812), forms a supplement to the above works. He died in 1616, and was buried in Westminster abbey. Hakluyt's unpublished manuscripts were made use of by Purchas in his *Pilgrims*. An

island in Baffin's bay was named after him by Bylot, and a promontory in Spitzbergen by Hudson. The *Hakluyt Society*, instituted in 1846, likewise took its name from him. Its object is the publication of all the histories of the earlier voyages and travels.

HAKODA'DI, or HAKODATE, the most northern of the opened ports of Japan, situated in 41° 40′ n. lat., and 141° 15′ e. long. The town stretches 3 m. along the base of a lofty promontory, which juts out into the strait of T'zagar, from the southern extremity of the island of Yesso. It is connected with the mainland by a low alluvial isthmus, and separated from the mountainous region to the n. by a plain bordered by an amphitheater of hills. The adjacent scenery is striking and picturesque, closely resembling that of Gibraltar. Hakodadi was ceded to the Tycoon by the prince of Matsumai in 1854. It was then a poor fishing-village, but has now become a place of importance. The houses are of a single story, fragile wooden buildings with single roofs, which are retained in their places by cobble stones. Each house has on its roof a tub filled with water for use in case of fire. The streets are between 30 and 40 ft. wide, clean, well-drained, and macadamized. In June 1869, after the revolution, the Mikado's forces attacked Hakodadi, which was occupied by the rebels, and a great part of the town was laid in ashes. Considering the latitude of Hakodadi, its climate is severe, and during its winter season the thermometer has been found to indicate 18° below zero. The observations of 1859 make its summer very nearly correspond to that of Edinburgh. The snow disappears about the beginning of April (though it often lies on the mountains until midsummer); and torrents of rain, brought up from the Pacific by the s.e. wind, quickly deluge the recently snow-denuded ground. Hakodadi is said not to be healthy, and yet longevity is frequent. The harbor is one of the finest and largest in the world, but difficult of access. It is divided into an outer and an inner harbor. By art. 3 of the treaty of Yedo (Aug. 26, 1858), Hakodadi was, together with Kanagawa and Nagasaki, opened to foreign commerce from July 1, 1859. It maintains commercial intercourse with all the large ports of Japan; a monthly steamer of the Pacific Mail runs to Yokohama. In 1869 the imports were $789,325; the exports, $990,710; but in 1871 they were much reduced. In 1877 the imports had only a value of $15,000, while the exports were valued at $430,000. Fish, oil, and fish-manure are the chief exports. There is a large fluctuating population connected with the fisheries. The registered Japanese population of the town in 1872 numbered 14,633. In 1877 there were 84 foreigners resident in Hakodadi, of whom 23 were British.

HAL, a t. of Belgium, in the province of South Brabant, on the Senne and the Charleroi canal, 10 m. s.e. of Brussels. It is a station on the Mons railway. The church of St. Mary is a rich Gothic edifice, containing a chapel resorted to by pilgrims on account of a black miracle-working wooden image of the virgin, 2 ft. high, which has acquired enormous wealth from the offerings of pious devotees. The high altar has a marble reredos, unequaled in the Netherlands, carved by Mone, a native artist, 1533. The town has breweries, tanneries, distilleries, several mills, and manufactures of wicker-work and articles of wood. Pop. '70, about 8,000.

HALACHA (rule) is the general term for the Jewish oral law, which runs parallel with the written law contained in the Bible, and is supposed to be like this, of divine origin. Its relation to the ordinances contained in the Pentateuch is that of an amplified code to the fundamental, religious, and civil maxims—such as the changes wrought by time in the inner and outer relations of a rapidly increasing people would of necessity produce. Handed down through a long chain of highest authorities (Sinaitic revelation, Moses, Joshua, Elders, Great Synagogue [Ezra], etc.), it could only be treated and further developed by the foremost men of each generation—such, in fact, as through their eminence in learning belonged to a kind of aristocracy of mind (Chachamim, Wise Men), towering above the multitude (Hediotim, idiots). Their decision on all ordinances involved in contradictory traditions was final, because it was believed to spring from a deeper apprehension of Scripture. Often, indeed, they had recourse, in order to give their opinion a greater weight, to certain special letters, words, and even signs in the Scripture, which, seemingly superfluous where they stood, were supposed to point to the injunction under discussion. Halacha embraces the whole field of juridico-political, religious, and practical life, down to its most minute and insignificant details. Originally, as we said, the oral law, by way of eminence, it began to be written down when the sufferings, to which the Jews were almost uninterruptedly subjected from the first exile downwards, had made many portions of it already very uncertain and fluctuating, and threatened finally to obliterate it altogether from memory. The first collection of laws was instituted by Hillel, Akiba, and Simon b. Gamaliel: but the final reduction of the general code, Mishna (q.v.), is due to Jehudah Hanassi, 220 A.D. Later additions to this code are formed by the Baraithas and Toseftas. Of an earlier date with respect to their contents, but committed to writing in later times, are the three books (Midrashim): Sifra or Thorath Kohanim (an amplification of Leviticus), Sifri (of Numbers and Deuteronomy), and Mechiltha (of a portion of Exodus). The masters of the Mishnaic period, after the Soferim, are the Thanaim. These were followed by the Amoraim, who, by discussing and further amplifying the Mishna, became the authors of the Gemara (q.v.), a work extant in two redactions—that of Palestine and of Babylon. The Halacha was

further developed in subsequent centuries by the Saboraim, Geonim, and the authorities of each generation. See also MIDRASH, MISHNA, TALMUD.

HALAS', a t. of Hungary, in the district of Little Cumania, is situated on the lake of Halastó, about 80 m. s.s.e. of Pesth. It had, '69, 13,127 inhabitants, who are employed chiefly in agriculture and the cultivation of the vine.

HALBERD, or HALBERT, a weapon borne, up to the close of the 18th c., by all sergeants of foot, artillery, and marines, and by companies of halberdiers in the various regiments. It consisted of a strong wooden shaft about 6 ft. in length, surmounted by an instrument much resembling a bill-hook, constructed alike for cutting and thrusting, with a cross-piece of steel, less sharp, for the purpose of pushing; one end of this cross-piece was turned down as a hook, for use in tearing down works against which an attack is made. The honor of inventing of the halberd is contested by the Swiss and Danes, but probably each produced something resembling it. Its name appears to be derived from the Teutonic *hild*, battle, and *bard*, axe. The halberd appears first in England about the time of Henry VIII., and maintained its position for upwards of two centuries. Now, it is rarely seen except on certain ceremonial occasions.

HALBERSTADT, an ancient and quiet t. of Prussian Saxony, in the government of Magdeburg, and 30 m. s.w. of the city of that name, is situated amid fruitful plains on the Holzemme, a tributary of the Saal. It is well built; its streets are for the most part long, broad, and tolerably straight; and among its most notable buildings are the church of Our Lady (1005–1284), in the Byzantine style, and the cathedral, an elegantly proportioned Gothic edifice, begun in the middle of the 13th c., and dedicated to St. Stephen. Halberstadt has two good libraries, and numerous collections of paintings, coins, and antiquities, which, together with the poetical society (Dichterverein), formed by the poet Gleim, have had the effect of maintaining here a lively appreciation for the arts and sciences. The manufactures are woolen and cotton fabrics, leather, soap, gloves, tobacco, and cigars; brewing and oil-refining are also carried on extensively. Pop. '75, 27,800.

HALBIG, JOHANN, b. Bavaria 1814; a sculptor educated in the Munich academy and professor of statuary in that institution. Since 1846 he has modeled more than 1,000 works, chiefly busts. The most notable are the lions at the gate of victory, Munich; a group of figures representing the states of the German empire in the hall of independence in Kelheim; *Christ on the Cross*, in Munich, and an allegorical group, *North America*, for a citizen of New York. In 1873 the king of Bavaria directed him to make a colossal group representing the crucifixion, to be placed on a mountain near Oberammergau.

HALCYON DAYS, a name given by the ancients to the seven days which precede and the seven which follow the shortest day, on account of a fable, that during this time, while the halycon bird or kingfisher was breeding, there always prevailed calms at sea. From this the phrase "halcyon days" has come to signify times of peace and tranquillity.

HALCYON'IDÆ. See KINGFISHER.

HALDANE, JAMES ALEXANDER, 1768–1851; a brother of Robert, and like him, passionately fond of a seaman's life. In 1793 he became the commander of the *Melville Castle*, but before the ship sailed a radical change took place in his religious character. Resolving to imitate his brother's example he sold his command for £9,000, and his interest in the ship and stores for £6,000, and with this fund of £15,000 retired with his wife to Scotland, giving his chief attention to religious concerns. Having obtained personal peace of mind, he spent much time in devising and prosecuting plans of usefulness. He organized many Sabbath schools, and preached extensively in the villages and large towns of Scotland. In company with John Campbell, the African traveler, he itinerated through the land as far as Orkney, and as congregations were gathered by their labors they were provided with houses of worship by the liberality of his brother Robert. He finally became the stated pastor of Leith Walk tabernacle, Edinburgh, and for 50 years performed there, without salary, all the duties of a minister. He also wrote and published: *Social Worship of the first Christians; Man's Responsibility and the Extent of the Atonement; Exposition of Galatians; Inspiration of the Scriptures.*

HALDANE, ROBERT, 1764–1842; an eminent philanthropist of Scotch descent, b. in London. He inherited a large property, but, having a passion for the sea, entered the navy, where he served with honor, 1780–83. When the French revolution commenced he regarded it with pleasure and hope, but was soon disappointed by its excesses. Having, after a season of doubt, become convinced of the divine origin of Christianity he heartily embraced it, and resolved to devote his life and fortune to its advancement. Selecting India as a field for missionary operations, he engaged the co-operation of several ministers to whom he pledged a sufficient support; but as the East India company refused to sanction the enterprise it had to be given up. He then resolved to work at home, sold his estate for 70,000 guineas, which he invested in the public funds, and, limiting himself and family to £500 per annum, devoted the remaining £5,500 of the income to the prosecution of his religious work. In company with Rowland Hill and other zealous men, he was very successful in awakening throughout Scotland a

deep interest on the subject of religion. But the unusual methods of work which they adopted, excited the opposition of the Scottish general assembly. Field preaching was forbidden, and other features of the revival were disapproved. Finding it impossible to submit to such restraint, Mr. Haldane seceded from the established church, and at his own cost erected tabernacles for public worship in many of the large towns of Scotland. At his expense, also, 300 young men were educated for the ministry under several eminent teachers. He established a theological seminary in Paris, and engaged in personal labors in promoting religion in the s. of France and in Switzerland. By his work in Geneva, a new impulse was given to evangelical Christianity, and an important theological school was established. His attention was directed also to missionary work in Africa, and as a beginning he had 30 children brought to England from Sierra Leone to be educated, giving a bond for £7,000 to meet their expenses. From this, however, he was relieved by friends of the cause in London. Besides accomplishing so much by gifts of money, and by personal labor in preaching and itinerating, he wrote several practical works, among which are: *The Evidence and Authority of Divine Revelation; Verbal Inspiration; An Exposition of the Epistle to the Romans.*

HALDEMAN, Samuel Stehman, b. Penn., 1812; educated at Dickinson college; in 1836 assistant in the geological survey of New Jersey, and the next year in the same service in Pennsylvania. In the university of Pennsylvania he was professor of natural history in 1851, and at a later period in the same capacity in Delaware college. At present he is professor of comparative philology in the Pennsylvania university. Some years ago he discovered the oldest fossil stone known up to that period. He has published many special papers on scientific themes, and in 1858 he issued *Analytical Orthography.*

HALDIMAND, a co. in the province of Ontario, Canada, near the e. end of lake Ontario, intersected by the Grand Trunk, the Great Western, the Canada Southern and the Hamilton and Lake Erie railroads; 475 sq.m.; pop. '71, 24,851. Seat of justice, Cayuga.

HALE, a co. in w. Alabama, on the Black Warrior river, crossed by the Alabama and Chattanooga railroad; 600 sq.m.; pop. '70, 21,792–16,990 colored. The surface is undulating, and a large portion is covered with forests, soil fertile, producing cotton, corn, etc. Co. seat, Greensborough.

HALE, Benjamin, D.D., 1797–1863; b. Mass.; graduated at Bowdoin college, and became principal of Saco academy. He studied theology at Andover, was a Congregational minister in 1822, and the next year a tutor in Bowdoin college; afterwards professor of chemistry and mineralogy at Dartmouth. From 1836 to 1858 he was president of Geneva (N. Y.) college. While at Dartmouth he took orders in the Protestant Episcopal church. He published *Introduction to the Mechanical Principles of Carpentry; Scriptural Illustrations of the Liturgy,* and sermons and addresses.

HALE, David, 1791–1849; b. Conn. When young he taught school in Boston; in 1815 went into business, but failed; in 1827 settled in New York and became one of the editors of the *Journal of Commerce,* and subsequently one of the chief proprietors. He was an advocate of free trade. He was noted for liberality and benevolence in religious enterprises, and himself purchased the building known as the Broadway Tabernacle, and established there an orthodox Congregationalist church.

HALE, Edward Everett, b. Boston, 1822; graduated at Harvard in 1839, and in 1846 became pastor of a Unitarian church in Worcester, Mass., whence he went to the south Congregational (Unitarian) church, Boston. Among his works are *The Rosary; Sketches of Christian History; Kansas and Nebraska; Letters on Irish Emigration; Ninety Days' Worth of Europe; Sybaris and Other Homes; How to Do it; Ingham Papers; Reformation; Level Best, and other Stories; Ups and Downs; Christmas Eve and Christmas Day; In His Name; Our New Crusade; Workingmen's Homes.* In addition to these he edited an edition of Lingard's *History of England;* was editor of the *Christian Examiner,* organ of the Unitarian body, and founded *Old and New,* a monthly magazine whereof he was the sole editor.

HALE, Eugene, b. Me., 1836; studied law, and was admitted to practice in 1857. For 9 years he was attorney for Hancock county. In 1867–68 he was a member of the legislature; in the latter year he was elected to congress, and was four times afterwards re-chosen, serving 10 years in all. He has long been prominent as a leader of the republican party.

HALE, John Parker, b. N. H., 1806; d. 1873; a statesman. He graduated at Bowdoin college in 1827, and settled at Dover, which was his home for the rest of his life. He was admitted to the bar in 1830, represented the town in the state legislature in 1832, and in 1834 he received from president Jackson the appointment of U. S. attorney for the district of New Hampshire. He held the office until 1841, when he was removed by president Tyler. In 1843 he was elected to congress as a democrat to fill a vacancy. In 1844 he was nominated by his party for re-election, in spite of his well-known opposition to the extension of slavery. The New Hampshire legislature in the summer of 1844, having passed a resolution instructing the members of congress from that state to vote for the annexation of Texas, Mr. Hale addressed a letter to his con-

stituents in which he declared that, as the annexation of Texas was designed to extend and perpetuate slavery, he could not conscientiously vote for the measure. The democratic state convention thereupon struck his name from the ticket and nominated another man in his stead. He ran as an independent candidate, but was defeated. In 1846, by a combination of independent democrats and whigs, acting together to resist the extension of slavery, Mr. Hale was elected speaker of the house of representatives, and before the close of the session chosen U. S. senator for six years from Mar. 4, 1847. As a senator he was a zealous opponent of slavery extension and the compromises of 1850. In 1847 the liberty party nominated him for president, but he declined, and in the election of 1848 supported Van Buren and Adams. In 1852 he was the free-soil candidate for president, and received 157,685 votes. On retiring from the senate in 1853, he entered upon the practice of the law in New York, but in 1855 he was again elected to the U. S. senate to fill a vacancy. In 1858 he was re-elected for a full term of 6 years, during which he was an ardent supporter of the administration of Mr. Lincoln, taking an active part in the legislation necessary to the vigorous prosecution of the war. At the close of his term in 1865, he was appointed minister to Spain. He was recalled by president Grant, and returned home in 1870. Soon afterwards he suffered an attack of paralysis, from which he never recovered. In 1873 his hip was dislocated by a fall, which hastened his death.

HALE, Sir MATTHEW, a distinguished lawyer, b. in 1609 at Alderley, Gloucestershire. In his 5th year he lost his parents, and was brought up by a kinsman of strict Puritan principles, and intended for the church. He was sent to Oxford university at 16, and was of studious disposition till a company of strolling-players visited that seat of learning, when the long pent-up passions of youth were suddenly let loose, and in this vagrant company he gave way to a good deal of dissipation, and at last was about to enter the army. But just at that time he became involved in a litigation about his patrimonial estate, and paid a visit to London to see sergeant Glanvil, then a leading lawyer, on that subject. The sergeant turned young Hale's ambition into a new direction; and ultimately, in 1629, the latter entered the society of Lincoln's Inn, and was in due course called to the bar. He had by that time renounced gay company, and became a great student, and soon acquired considerable practice. When the long parliament began to meet, he was of considerable reputation; and having cautiously refrained from committing himself to either of the great parties, both sought to enlist him in their service. But he declared for neutrality—conduct which lord Campbell pronounces cowardly and selfish. When, however, the parliament triumphed, Hale signed the solemn league and covenant, and sat in the assembly of divines at Westminster, tried to bring about a settlement between the king and parliament, and ultimately took his engagement to the commonwealth, and was made a judge under Cromwell in 1653, having overcome his natural scruples about serving a usurper, on the plea of necessity. He acted as a *puisne* judge of the common pleas till Cromwell's death, but refused to have his commission renewed by Richard Cromwell, and then entered parliament. On the restoration, he was made chief baron of the court of exchequer; and after 11 years, was transferred to the chief-justiceship of the court of queen's bench. He was reckoned the best judge of his time, being acute, learned, and sensible, and set his face against bribery, one of the vices of the age. John Bunyan was brought before him, and convicted of frequenting conventicles; and when Bunyan's wife afterwards moved for her husband's discharge, she was politely dismissed without redress. Hale also sentenced some women, convicted of witchcraft, to be executed, avowing his full faith in the delusion of that age, that this was a grave and dangerous offense. During his career as a judge, Hale led an austere and scholarly life, leaning to the side of the Puritans. He made a friend of Richard Baxter, and has left a great reputation for piety. He wrote some legal works, which are still of the highest authority, and he bequeathed several valuable legal MSS. to Lincoln's Inn, which are still treasured there. He resigned his office from ill health in 1676, and died on Christmas day of that year.

HALE, NATHAN, 1755–76; b. Conn. He was a school teacher, but after the Lexington fight he joined the revolutionary army, and soon became a captain. At New York, in Sept., 1776, he and one associate at midnight took an English sloop laden with provisions from under the guns of a vessel of war. After the battle of Long Island, Hale offered to undertake a visit to New York city, to learn the British strength and plans. He was successful for some time, but was captured while returning to Washington's camp, and was taken to sir William Howe, who ordered his execution the next morning. Hale was denied the visit of a minister and was refused the use of a Bible. The letters he wrote to his mother were destroyed, and Hale died saying that "he lamented that he had but one life to lose for his country."

HALE, NATHAN, 1784–1863; b. Mass.; graduated at Williams college; studied law, and was admitted to the bar in 1810. In 1814 he and Henry D. Sedgwick edited the *Weekly Messenger*. In the same year Hale bought the *Daily Advertiser* of Boston, the first regular daily journal in the eastern states. The *Advertiser* was whig and afterwards republican in politics, and in his paper Hale opposed the admission of Missouri (with slavery), in 1820, and opposed the pro-slavery bill of 1834. In 1828 he published a book arguing for protection to home industry. He was also an early advocate and

promoter of railroads. He was in both branches of the legislature, a member of two constitutional conventions, and belonged to various scientific societies.

HALE, SARAH JOSEPHA, American authoress, was b. at Newport, N. H., 1795; her maiden name was Buell. Married to David Hale, an eminent lawyer, about 1814, she pursued with him a regular course of study until his death in 1822, when she devoted herself to authorship, and produced her earliest work, *The Genius of Oblivion, and other Poems* (Concord, N. H., 1823), followed by *Northwood, a Tale of New England* (Boston, 1827). In 1828 she removed to Boston, and edited the *Ladies' Magazine*, monthly, until 1837, when it was united with the *Ladies' Book*, Philadelphia, in which city she has since resided. Besides her labors as editor, she has written *Sketches of American Character; Traits of American Life; Flora's Interpreter; Good Housekeeping; Groszenor, a Tragedy* (founded on the story of col. Hayne, a martyr of the revolution); *The Judge, a Drama of American Life;* three metrical romances (entitled *Alice Ray; Three Hours, or The Vigil of Love;* and *Harry Grey*); and her most important work, *Woman's Record*, or sketches of all distinguished women from the creation to 1854 (2d edition, New York, 1855). All her works are characterized by good taste, and her tales and poems by vivid description and strong pathos.

HALES, ALEXANDER OF. See ALEXANDER OF HALES, *ante*.

HALES, STEPHEN, an English natural philosopher, was b. at Beckesbourn, in Kent, in 1677, and died at Teddington, in Middlesex, in 1761. He entered Bene't (now known as Corpus Christi) college, Cambridge, in 1696, was elected fellow in 1702, and having taken holy orders, was presented about 1710 to the perpetual curacy of Teddington, where the remainder of his life seems to have been spent.

His first important publication was *Vegetable Staticks, or an Account of some Statical Experiments on the Sap of Vegetables* (1727), which rapidly acquired so high a reputation as to be translated into French, German, Dutch, and Italian, and which may be considered the starting-point of our true knowledge of vegetable physiology. A second part of this work, under the title *Hæmastaticks*, and treating of the circulation of the blood, appeared in 1733. Besides other independent works, he contributed numerous memoirs to the *Philosophical Transactions* on ventilation, on the methods of keeping water fresh, on electricity, on the analysis of the air, etc. His ventilating machines were introduced into the London prisons, and were found most efficacious in diminishing mortality among the prisoners. His system was also adopted in France with similar good results.

His improvements in the mode of collecting gases did much to facilitate the subsequent labors of Black, Priestly, and Lavoisier.

HALÉVY, JACQUES FRANÇOIS FROMENTAL, a French composer, was b. at Paris, of Jewish parentage, May 27, 1799. He studied under Berton and Cherubini, and afterwards at Rome. The first work of Halévy's that brought him any considerable reputation was *La Juive*, produced at the grand opera in 1835. The most important of his subsequent pieces (of a serious character) were: *La Reine de Chypre; Charles VI.; Le Juif Errant;* and *La Magicienne*. Those executed for the Opéra Comique are regarded as his most successful; the principal are: *Les Mousquetaires* (probably his master-piece), *L'Eclair*, and *Le Val d'Andorre*. He was a great favorite with his countrymen; but his style was so purely national, that, in spite of his great dramatic power, he did not enjoy a great celebrity out of France. Halévy died in Mar., 1862.

HALÉVY, LÉON, b. Paris, 1802, brother of the composer. He became a supporter of St. Simon, and one of the founders of *Le Producteur*. In 1831 he was adjunct professor of literature in the polytechnic school, and in 1837–57 was prominently connected with the bureau of historical monuments in the ministry of the interior. Among his works are *Fables*, *La Grece Tragique*, a resumé of Jewish history; *Luther on the Diet of Worms*, and *Electre*, a drama.

HALÉVY, LUDOVIC, b. Paris, 1834; son of Léon. He was for several years employed in the ministry of the state, and in the colonial office as chief of bureau; but he is known principally by his dramatic works, among which are libretti for the operas of *Orphée aux Enfers; La Belle Hélène; Barbe-Bleue; La Grande Duchesse; La Périchole*, and *Frou-Frou*.

HALF-BLOOD, i.e., persons related through one parent only. When two persons have the same father, but not the same mother, they are called brothers or brother and sister consanguinean; when they have the same mother only, they are called brothers, etc., uterine. In the succession to real or landed property in England, the half-blood relations by the father's side succeed after the full-blood relations; and next, but at a considerable interval, the half-blood relations by the mother's side. In Scotland, also, the half-blood consanguinean succeed to heritable estate in the same way, though not in identically the same order; but the half-blood uterine never succeed in any event. In England, as regards personal estate, the half-blood on both sides succeed indiscriminately, and share equally with the full-blood. But in Scotland, the half-blood only succeed to movable estate after all the full-blood and their descendants are exhausted, and then the half-blood by the father's side succeed in exclusion of the half-blood by the mother's side, who do not come in until the succession reaches a distant

point, viz., where the nearest relations are uncles and aunts paternal, or their descendants, in which case only the half-blood uterine after the mother's death take half the property, and the paternal relatives the other half. See Paterson's *Comp. of E. and S. Law*.

HALFORD, Sir Henry, 1766–1844; b. England; educated at Rugby and Oxford, and in 1794 became a fellow of the college of physicians, and soon gained extensive practice in London. In 1809 he was created a baronet, and was subsequently physician to the Georges III. and IV., to William IV., and finally to queen Victoria. He was president of the college of physicians in 1824. He published *Essays and Orations; The Death of Some Eminent Persons of Modern Times*, and some translations.

HALF-PAY, an allowance given in the British army and navy to commissioned officers not actively employed in the rank to which the half-pay has reference. It corresponds to the French *demi-solde*, or pay of *non-activité*. It has long been a disputed point whether half-pay is given to officers as a retaining fee, to keep them at hand for the time when their services may be again required, or an award on account of services already rendered; but whatever the terms of the original grant, there can be little doubt that, under the present regulations, half-pay, except when distinctly named *retired* half-pay, is in the nature of a retaining fee. This allowance is on quite a different footing in the navy and army.

In the royal navy of Great Britain, officers are merely appointed to serve during the period a certain ship is in commission; when this expires, their employment ceases, and they revert to a state of non-activity. As there are always many more naval officers than appointments for them to fill, a considerable number are at all times on the non-effective list. These are placed on half-pay until again called upon to serve; the amount of such half-pay being usually about 60 per cent of the full pay of each grade. Half-pay is thus in the navy a recognized condition for all officers not immediately wanted afloat.

In the British army, the case is different; there, an officer, on joining, is posted to a particular regiment, with which, in theory, he is supposed to serve until removed from it on attaining the rank of general. Consequently, no fund like the naval half-pay list is in any degree admitted. Army half-pay is of two natures—*temporary* half-pay, and (so-called) *permanent* half-pay. The former is limited to officers incapacitated by casual sickness, to those who are without occupation, in consequence of any reduction of the corps in which they were serving, and to those serving in certain staff appointments.

Permanent half-pay can be demanded by any officer who has served for 25 years; it is also given to majors and lieut.-colonels who, after serving for 5 years with a regiment in those ranks, are not re-employed. Since the abolition of purchase and sale of commissions, this last class may be expected, for the sake of promotion in the lower ranks, to increase considerably. The cost of half-pay is already very great; in 1877–78, it was £315,500 for the army. Till lately, a large proportion of the recipients were officers placed on the list at the great reduction after the peace of 1815. The vote for naval half-pay in 1877–78 was £746,341.

The first grant of army half-pay was made in 1698 by William III.

HALF-PAY (*ante*), a system in Great Britain of pensioning worn-out officers and those too old to do service in the army and navy, and in some cases in the civil service. There is not precisely this system or practice in the United States, but there is sometimes a distinction between officers on active duty and those awaiting orders, while officers are retired on a proportionate amount of full-pay, according to length of service. These are some of the cases. In the navy:

Officers.	At Sea.	On Shore.	Waiting Orders.
Admiral	$13,000	$13,000	$13,000
Vice-admirals	9,000	8,000	6,000
Rear-admirals	6,000	5,000	4,000
Commodores	5,000	4,000	3,000
Captains	4,500	3,500	2,800
Commanders	3,500	3,000	2,300
Lieutenant-Commanders	2,800	2,400	2,000
Lieutenants	2,400	2,000	1,600
Masters	1,800	1,500	1,200
Ensigns	1,200	1,000	800
Midshipmen	1,000	800	600
Cadet Midshipmen	500	500	500
Mates	900	700	500
Chief Medical Officers, Paymaster, and Chief Engineer	2,800	2,400	2,000
Chaplains	2,500	2,000	1,600
Boatswains, Gunners, Carpenters, and Sail-makers	1,200	900	700
Naval Constructors	3,200	3,200	2,200

In the army the salaries from maj.gen. downwards are graded as follows:

Officers.	Yearly Pay of Officers in Active Service.					Half-pay of Retired Officers.				
	1st 5 yrs.	After 5 yrs.	After 10 yrs.	After 15 yrs.	After 20 yrs.	1st 5 yrs.	After 5 yrs.	After 10 yrs.	After 15 yrs.	After 20 yrs.
Maj.general	$7,500	.....	.....	.....	.....	$5,625	.....	.....	.....	.....
Brig.general	5,500	.....	.....	.....	.....	4,125	.....	.....	.....	.....
Colonel	3,500	$3,850	$4,200	$4,500	$4,500	2,625	$2,887	$3,150	$3,375	$3,375
Lieut.col.	3,000	3,300	3,600	3,900	4,000	2,250	2,475	2,700	2,925	3,000
Major	2,500	2,750	3,000	3,250	3,500	1,875	2,062	2,250	2,437	2,625
Captain (mounted)	2,000	2,200	2,400	2,600	2,800	1,500	1,650	1,800	1,950	2,100
" (not mounted)	1,800	1,980	2,160	2,340	2,520	1,350	1,485	1,620	1,755	1,890
1st Lieut. (mounted)	1,600	1,760	1,920	2,080	2,240	1,200	1,320	1,440	1,560	1,680
" (not mounted)	1,500	1,650	1,800	1,950	2,100	1,125	1,237	1,350	1,462	1,575
2d Lieut. (mounted)	1,500	1,650	1,800	1,950	2,100	1,125	1,237	1,350	1,462	1,575
" (not mounted)	1,400	1,540	1,680	1,820	1,960	1,050	1,155	1,260	1,365	1,470
Chaplain	1,500	1,650	1,800	1,950	2,100	1,350	1,485	1,620	1,755	1,890

HALIBURTON, THOMAS CHANDLER, ex-colonial judge, author, and politician, was born at Windsor, in Nova Scotia, in 1796. His father, the hon. Mr. Justice Haliburton, of Nova Scotia, was descended from an ancient Scottish family. Haliburton received his education at King's college in Nova Scotia, afterwards practiced as a barrister, and became a member of the house of assembly. He was raised to the bench of the common pleas of the colony in 1829, and in 1840 became judge of the supreme court. In 1859 he retired from the bench, and took up his residence in England, which he had always regarded as his mother-country. In 1858 he received the degree of D.C.L. from the university of Oxford, and in 1859 took his seat on the conservative benches of the house of commons as M.P. for Launceston, which he represented until his death. Haliburton is best known as the author of *Sam Slick*, the name of a Yankee clockmaker and peddler, a sort of American Sam Weller, whose quaint drollery, unsophisticated wit, knowledge of human nature, and aptitude in the use of what he calls "soft sawder," have given him a fair chance of immortality. In a subsequent series, the author brings Sam Slick to England as an attaché of the United States legation, and is thus enabled to offer many shrewd and humorous observations on the aspects of British society, especially in regard to the upper classes and their pampered servants. *Sam Slick* has been almost universally read in the United States, where its extravagances are keenly relished. It has enjoyed a wide popularity in England, and has also been translated into many continental languages. Haliburton is also author of the *Letter-bag of the Great Western*, *Wise Saws and Modern Instances*, *Nature and Human Nature*, *Bubbles of Canada*, *Rule and Misrule of the English in America*, and *A History of Nova Scotia*. He died in Aug., 1865, having attained a place and fame difficult to acquire at all times—that of a man whose humor was nurtured in one country, and became naturalized in another; for humor is the least exotic of the gifts of genius.

HALI'BUT, or HOLIBUT, *Hippoglossus vulgaris*, one of the largest kinds of flat-fish (*pleuronectidæ*), in form more elongated than the flounder or the turbot, the eyes on the right side, the upper surface smooth, and covered with small soft oval scales, the color brown, of different shades, the under surface perfectly smooth and white. The halibut, although esteemed for the table, is not to be compared in quality with turbot; its flesh is white and firm, but dry, and has little flavor. It is common on the British coasts; but more abundant in the n. than in the s., and greater numbers are taken by the Orkney fishermen. It is not found in the Baltic, but is plentiful on the coasts of Norway, Iceland, and Greenland, and large quantities are taken on the northern parts of the American Atlantic coast. It is a fish of great value to the Greenlanders, who preserve it for winter use by cutting it into long slips and drying it in the air. Oil is obtained from it in considerable abundance. It attains a great size; specimens have been caught weighing nearly 500 pounds. Other species of the same genus occur in the seas of other parts of the world.

HALICARNAS'SUS (originally called *Zephyria*) was one of the Greek cities of Asia Minor, situated on the Ceramic gulf. It was founded by a colony from Trœzene, and was one of the cities of the so-called Doric Hexapolis, from which confederacy, however, it was eventually excluded. Halicarnassus was the largest and most powerful of the cities of Caria, and by its situation and the inaccessible position of its citadel, was reputed a place of great strength: but the people, owing to the enervating influence of the climate, were of a weak and effeminate character; and during the Persian conquests, readily yielded to the dominion of the conquerors. During this period (about 500 B.C.), however, a domestic tyrant, Lygdamis, rose to supreme power as a vassal of Persia; and under his descendants the city, without forfeiting the Greek character, or ceasing to cultivate the Greek literature and arts, remained faithful to the Persian interest. Artemisia, the daughter and successor of Lygdamis, actually commanded a naval squadron in the fleet of Xerxes, at the battle of Salamis. Alexander the great, provoked by

the obstinacy with which the city held out against him, commanded that it should be destroyed by fire; but the inhabitants took refuge in the citadel, which successfully resisted his arms. The city was afterwards rebuilt, but it never recovered its ancient importance or prosperity. In the days of the Roman empire, it had sunk into comparative political insignificance, its only title to consideration at that time being the celebrated mausoleum, erected in memory of one of the rulers, named Mausolus, by his sister (who had also been his wife and successor) Artemisia. Halicarnassus was the birthplace of two of the most eminent of the Greek historians, Herodotus and Dionysius. The site of the city is occupied by the modern Boudroum. For an account of the discovery of the ancient remains of the city, and of the disentombment of the mausoleum, see MAUSOLEUM.

HALICORE. See DUGONG.

HA'LICZ, a t. of Austria, in the crownland of Galicia, is situated on the Dniester, in a fruitful district in the administrative division of Stanislawow, about 14 m. n. of the town of that name. There are here a convent of the Minorites; a community of Jews of the sect of the Caraites, distinguished for their industry and uprightness; and on the ridge of a hill in the vicinity, the ruins of the once strongly fortified castle of Halicz, which has frequently been the witness of bloody encounters. Halicz, from which Galicia has derived its name, is the oldest town in that crownland. It was built in the 12th c., and its castle was the residence of the rulers of what was formerly the grand principality of the kingdom of Halicz. Pop. '69, 3,142.

HAL'IDON HILL, situated about a mile to the n.w. of the t. of Berwick, in the fork formed by the Whitadder and the Tweed, was the scene of a bloody conflict between the English and Scots, July 19, 1333. Edward III., having determined to support the claims of Edward Baliol to the crown of Scotland, advanced to the borders with a large army and laid siege to Berwick, the governor of which promised to surrender on July 20, if not previously relieved. On the 19th, the acting regent of Scotland, Archibald Douglas, lord of Galloway, surnamed "the Tyneman," with a large force, came in sight of Berwick, and found the English drawn up on the n. side of Halidon Hill. Regardless of fatigue, the Scots immediately advanced to the attack, but while crossing the morass which skirts the base of the hill, suffered severely from the English archers. They nevertheless struggled onwards, and mounted the hill, when the English, charging in a compact body, threw them into irretrievable confusion. A total rout was the immediate result, and the English cavalry and Irish auxiliaries committed a prodigious slaughter among the fugitives; upwards of 10,000 Scots (according to some authorities, 14,000) being left on the field, among whom were Douglas the regent, three of the Stuart family, the earls of Ross, Sutherland, Menteith, Lennox, and Athole, and many others of the nobility. The English loss was compartively small. The town of Berwick immediately surrendered, and Edward Baliol again for a short time kept possession of the throne.

HALIFAX, a co. in North Carolina, on Roanoke and Fishing rivers, intersected by the Wilmington and Weldon, and the Raleigh and Gaston railroads; 630 sq.m.; pop. '80, 30,300—21,138 colored. Much is still covered with forests. The soil is fertile, producing cotton, corn, etc. Co. seat, Halifax.

HALIFAX, a co. in s. Virginia, on the North Carolina border, on Dan river, intersected by the Richmond and Danville railroad; 960 sq.m.; pop, '70, 27,828—16,266 colored. Soil fertile; chief productions: tobacco, corn, wheat oats, and pork. Co. seat, Halifax Court-House.

HALIFAX, a co. in s. Nova Scotia, on the Atlantic coast; area 2,450 sq.m.; pop. '71, 56,963. The region is fairly fertile, and the coast is deeply indented with bays, some of which afford good harbors. Chief town, Halifax (city). There is railroad communication around the bay of Fundy to St. Johns and the United States and Canada.

HALIFAX, the capital of Nova Scotia, stands on the s.e. or outer coast of the peninsula, in lat. 44° 39' n., and lat. 63° 37' west. Though it was founded only in 1749, yet so favorably was it situated, that in 1750 it supplanted Annapolis as the seat of government. The harbor of Halifax is one of the finest in the world. It is entered from the s., extends northwards about 16 m., and terminates in a magnificent sheet of water called Bedford basin, is spacious enough for the entire navy of England, and offers all the year round easy access and safe anchorage to vessels of any magnitude. The harbor has two entrances, made by M'Nab's island, of which the western only is navigable for vessels of large tonnage. Halifax, with its suburbs, extends along the slope of a hill, and is over 2 m. in length, and about three-quarters of a m. in width. The streets are well laid out, and at right angles; and handsome granite and free-stone have superseded wood. The dockyard, covering 14 acres, is among the finest in the British colonies. The principal edifices are the province building (which contains the government offices), Dalhousie college, government house, military hospital, admiralty house, lunatic and blind asylums, provincial penitentiary, court-house, exchange, post office, theater, workhouse, jail, etc. Halifax also contains 24 places of worship, and is the seat of two bishops. It is an important military post, being defended by strong forts and batteries one of which, called the Citadel, stands on the summitt of the hill on which Halifax is

built, and is said to be, after Quebec, the strongest fortification in America. Halifax and Quebec are now the only places in Canada where British troops are retained; the troops occupy extensive and handsome barracks overlooking the harbor. Halifax is the chief naval station for British North America. The head offices of the Nova Scotia railway, and the Nova Scotia electric telegraph company are situated here. It has railway communication with Annapolis, Pictou, St. John, Truro, and Windsor. The port engrosses nearly the whole of the foreign trade of the colony. In the year ending June 30, 1872, the exports amounted to $4,678,684, and the imports to $10,055,579. The population of Halifax at the census of 1871 was 29,582.

HALIFAX, a thriving market-town, municipal and parliamentary borough of England, in the West Riding of Yorkshire, is situated principally on the right bank of the river Hebble, a feeder of the Calder, on the slope of an eminence rising above the river, and is almost wholly surrounded by hills. It is 43 m. s.w. of York, and 217 m. n.n.w. of London. Its situation is pleasing, and its general appearance handsome; while its ample supply of water-power and of coal, its facilities for transport both by water and by leading lines of railway, and its position in proximity to many of the great towns of the north of England, contribute materially to its manufacturing and commercial importance. The ecclesiastical architecture of Halifax strikes every visitor. The parish and Trinity churches, "All Souls," an Episcopalian church completed in 1861 from designs by sir George Gilbert Scott, are fine specimens of Gothic. The "Square Church," belonging to the Congregational body, erected in 1863; and another connected with the same sect, built in 1867, are conspicuous features. The town-hall, opened by the prince of Wales in 1863, is a very ornate erection. The Piece hall, a large quadrangular stone building, erected in 1779, at a cost of £12,000, and comprising 315 apartments or warehouses for the reception and sale of manufactured goods; and the assembly rooms, Mechanics' institute, and theater. Among the numerous public and private educational institutions of Halifax are the Heath grammar school—founded in 1585, with an endowment of £270 a year—and the Blue Coat school. In 1857 Mr. F. Crossley, M.P. for the West Riding, presented a magnificent park to the town. It contains the largest carpet-works in the world. The manufactured goods, besides carpets, are chiefly shalloons, tammies, calamancoes, duroys, everlastings, moreens, shags, serges, merinoes, as well as baizes, narrow and broad cloths, cassimeres, and bombazines. Cotton fabrics, wool-cards, and paper are manufactured. There is also some trade in corn, in mill-machinery, and in raising coal and slate. Pop. '71, 65,510.

A strange old local law, known as the Halifax gibbet law, was enacted here at an early period of the woolen manufacture for the protection of the manufacturers against the thievish propensities of their hands, who were in the habit of robbing their employers by keeping to themselves a portion of the material which ought to have gone into the cloth, so that when manufactured the fabric was discovered to be of inferior weight and body. The gibbet law provided that all persons within a certain circuit, who had stolen property of or above the value of 13½d., were to be tried by the frithburgers within the liberty, and if found guilty, were handed over to the magistrates for punishment, and were executed on the first market-day following by means of an instrument similar to the guillotine. The stage or platform on which the executions took place is still to be seen, and the axe is preserved in the old jail in Jail lane.

HALIFAX, CHARLES MONTAGUE, EARL OF, poet and statesman, grandson of Henry, first earl of Manchester, and nephew of the famous parliamentary general, was b. at Horton, in Northamptonshire, April 16, 1661. He was educated at Westminster school and Trinity college, Cambridge. A laudatory poem on Charles II. first brought Montague into public notice. Two years later appeared the parody on Dryden's *Hind and Panther*, entitled *The Town and Country Mouse*, of which he was joint author with Matthew Prior; but his poetry would hardly have made his name remembered in the 19th century. He almost disappeared from the field of literature after the appearance of his satire, save as the patron of Addison and other men of letters. He had intended to enter the church, as it afforded a regular income, but tempted by the offer of a seat in the house of commons, he became member for Malden in the convention parliament, where he voted for the declaration that James II. had abdicated, and that the throne was thereby vacant. He retained his seat in William III.'s first parliament, and was appointed in 1692 a commissioner of the treasury. On Dec. 15 of this year he proposed, in the house of commons, to raise a million sterling by way of a loan. William required money for his wars —the moneyed classes were tired of bubble companies, and knew not where to invest safely, and the landowners were weary of heavy taxation; so the national debt was established. In the spring of 1694 money was again wanted, and Montague was ready to supply it. This time he did so by originating a national bank, a scheme for which had been laid before the government by William Paterson three years before. The capital was to be £1,200,000, and the shareholders were to be called the governor and company of the bank of England. The bill for this was ultimately passed; the result was immensely successful, and Montague became chancellor of the exchequer. His next work was the recoinage of 1695, which he carried out successfully, appointing Newton warden of the mint, and raising a tax on windows to pay the expense, instead of the obnoxious impost called hearth-money. The interval between the last day on which the

old money was receivable in payment of taxes and the issue of the new coin, was, owing to the absence of a circulating medium, likely to cause much distress; but he obviated this by establishing exchequer bills bearing interest daily, and ranging in amount from £5 to £500. On Godolphin's resignation, in 1697, he became premier, but soon becoming unpopular, was obliged to bestow upon himself the auditorship of the exchequer, and resign his higher offices. Harley insisted on his withdrawal from the commons, and he became baron Halifax, adopting a title which had just become extinct. He was impeached before the house of lords for breach of trust in 1701, and again in 1703, but the proceedings fell to the ground. During the whole of Anne's reign, Halifax remained out of office, but was active in promoting the union with Scotland and the Hanoverian succession. On the queen's death, he was naturally appointed a member of the council of regency, and on George I.'s arrival, became an earl and prime minister. His rule lasted only nine months, being terminated by death on May 19, 1715. Halifax, though an arrogant and mean man and fond of display, was a consistent politician, and one of the greatest financiers of his time.

HALIFAX, MARQUIS of. See SAVILLE, GEORGE, *ante*.

HALIFAX COURT-HOUSE, the seat of justice of Halifax co., Va. It is also called Banister (q. v.), and is on the river of that name, in the midst of a tobacco raising region. Pop. about 700.

HALIFAX RIVER, in Volusia co., Fla.; a tide-water channel running inland 30 m. from Musquito Inlet and continuing s. to Hillsborough river. It is navigable.

HALIM PASHA. See ABD-EL-HALIM.

HALIOTIS, a genus of gasteropodous mollusks, the type of a family, *haliotidæ*, belonging to the order *scutibranchiata*, and having a widely open ear-shaped shell, with a very low spire, and a row of holes not far from the opposite margin over the fissure of the mantle, through which the water gains access to the gill-cavity. The holes are closed as the animal grows, and new ones formed, which first appear as notches along the margin of the shell. The animal, in a living state, exhibits great beauty of colors. It adheres to rocks by a large muscular foot, after the manner of limpets. One species, *H. tuberculata*, is not uncommon on the southern European coasts, and is found on those of the Channel Islands. It is used for food; the shell is also sought after for an ornament, and for the sake of the nacre (q. v.) in which it abounds, and which is much used for mother-of-pearl ornaments, and particularly for ornamenting *papier-maché* articles. The shells of this genus are called *earshells* or *sea ears*. They are the *ormers* of the French. The species are very numerous; the most splendid are natives of warm climates.

HALL, the large principal apartment of the castles and dwelling-houses of the middle ages. The hall is of very ancient origin. The earliest Saxon buildings we have any record of are the palaces of the kings, and these seem to have consisted of one large hall, in which the king, his courtiers or "hearth-men," and all his retainers dwelt together, eating at the same table, and sitting round the same fire; and one other chamber, in which the king and his hearth-men slept, while his retainers slept in the hall. The Normans built their houses on the same plane—with the hall and one solar (q. v.) or sleeping apartment. The same arrangement prevailed, with slight modifications, during the 12th and 13th centuries. In the 14th and 15th centuries, when the country was more settled and prosperous, and manners more refined, more numerous apartments became necessary. The hall, however, still retained its place as the chief apartment. In it the king or the lord of the manor gave audience, administered justice, received and entertained his retainers and guests, and performed all the public acts of feudal life.

At one end of the hall was a raised platform or dais, on which the table of the lord of the manor was placed, and where his more honored guests sat along with him. The retainers sat at a table which ran along the lower part of the hall. This part was not always in the cleanest and sweetest condition, and hence it received the name of "the marsh."

The hall partook of the style of architecture prevailing at the time when it was built, and being a large and important apartment, was generally ornamental in its character. The roofs especially were very carefully and elegantly constructed, as many still remaining show. The hall of the king's palace, now called "Westminster Hall," built by William Rufus, and restored by Richard II., is the finest example in England, being 300 ft. long and 100 ft. broad.

The hall was essentially a part of feudal architecture. When that system gave way, the large common halls were abandoned. Many old ones, however, still remain, but their use is changed.

HALL, as known at the great seats of learning in England is connected with a college though not incorporated nor as a rule endowed. Many years ago there were 500 halls at Oxford, but now there are very few. The number of colleges connected with the great universities in which provision was made for the support of the members was, for many centuries, small in comparison to the halls or inns (*aulæ*, *hospitia*), in which the students lived chiefly at their own expense, and were merely furnished with cheap and convenient lodgings. At the commencement of the 14th c. the number of halls was

about three hundred, while the colleges amounted only to three. For the establishment of a hall, nothing more was necessary than that a few students, on a mutual agreement to live together, should hire a house, find security for a year's rent, and choose for principal a graduate of respectable character. The chancellor or his deputy could not refuse to sanction the establishment, and to admit the principal to his office. The halls were in general held only on lease; but by a privilege common to most universities, the rent was fixed every five years by sworn taxers, two masters, and two citizens; and houses once occupied by students could not be resumed by the proprietors so long as the rent was punctually paid. The halls were governed by peculiar statutes, and were liable to be visited and regulated by the university. The causes which occasioned a diminution in the number of the scholars, diminished also the number of the halls, though that of the endowed colleges continued to increase. At the commencement of the fifteenth century, while the students were diminishing, the colleges had risen to seven. In the beginning of the sixteenth century, the number of halls had fallen to fifty-five, while the endowed colleges had increased to twelve. In 1546 the inhabited halls amounted to only eight; and in 1651, Wood remarks that, "the ancient halls lay either waste, or were become the receptacles of poor religious people turned out of their cloisters."

HALL, a co. in n. Georgia, on the Chattahoochee drained by the 'Oconee, intersected by the Atlantic and Richmond air line railroad; 600 sq.m.; pop. '70, 9,607—1290 colored. The surface is hilly; main products: corn, wheat, and hay. Gold and precious stones have been found.

HALL, a co. in central Nebraska on Platte river, crossed by the Union Pacific railroad; 576 sq.m.; pop. '76, 4,615. It has an undulating prairie surface, and good soil for pasturage. Corn, wheat, and oats are raised. Co. seat, Grand Island.

HALL, a small and very old t. of Austria, in the Tyrol, is situated on the left bank of the Inn, which is here navigable, six m. e. of Innsbruck. Its parish church, built in 1271, with a monument that marks the grave of Spechbacher, the bravest and most skillful leader of the Tyrolese in their struggle for independence; its gymnasium, its Franciscan convent, and its *Münzthurm*, are the chief buildings. About nine m. n. of the town is the Salzberg, with salt mines, from which salt in the form of brine is conveyed to the pans of Hall in wooden pipes. Although the demand is not so great as formerly, upwards of 300,000 cwts. of salt are still produced here. Hall has also manufactures of sal-ammoniac and chemicals. Pop. '69, 5,022.

HALL, Mrs. ANNA MARIA, an eminent novelist, the daughter of a gentleman named Fielding, who died when she was very young, was born in Dublin in 1802. In her 15th year she left Ireland with her mother, and went to reside in London, where her education was completed. In 1824 she married Mr. S. C. Hall, a gentleman well-known for his works connected with the fine arts, and was thus led to become an authoress. Her first work, *Sketches of Irish Character*, published in 1828, at once established her reputation. In 1832 she brought out her first novel, *The Bucaneer*, a story of the time of the commonwealth, in which Cromwell's character is vindicated. Her other works rapidly followed—*Tales of Woman's Trials*, in 1834; *The Outlaw*, a novel of the reign of James II., in 1835; *The French Refugee*, a drama, which in 1836 was acted for about fifty nights at the St. James's theater, London; *Uncle Horace*, 3 vols. 1837; *Lights and Shadows of Irish Character*, 1838; *Marian, or a Young Maid's Trials*, 1839; *The Whiteboy*, 1845, etc. Her *Stories of the Irish Peasantry* appeared originally in *Chambers's Edinburgh Journal*, and were afterwards published in a collected form. She is also the authoress of a graceful fairy tale of love, *Midsummer Eve*, originally contributed to the *Art Journal*, and of a pleasant illustrated series of descriptive sketches, inserted in the same publication, and subsequently published separately under the title of *Pilgrimages to English Shrines*. The last two, with some others of her writings, have been translated into German. Besides assisting her husband in his illustrated work on *Ireland*, etc., she has furnished numerous contributions to the periodicals of the day, and written various books for the young. Of these, *Uncle Sam's Money Box* is one of the best.

HALL, BASIL, Captain, R.N., a distinguished traveler, a younger son of Sir James Hall of Dunglass, was b. in Edingburgh in 1788, and d. at Portsmouth in 1844. He entered the navy in 1802, and became post-capt. in 1817. When lord Amherst was sent on a mission to the court of Pekin in 1816, Hall commanded the *Lyra*, a small gun-brig, which accompanied the expedition, and took the opportunity of visiting some of the places along the coast of the Corea, which were little known to Europeans. The chief results of this exploration were published in a book entitled *A Voyage of Discovery to the Western Coast of Corea and the Great Loo-Choo Island in the Japan Sea* (Lond. 1818), which excited much interest, and passed through at least three editions. Amongst his other works, we may mention *Extracts from a Journal written on the Coast of Chili, Peru, and Mexico, in* 1820—1822 (which forms two of the earlier volumes of *Constable's Miscellany*); *Travels in North America*, in three vols. (a work that was violently assailed by the American press); *Fragments of Voyages and Travels*, in three series, each consisting of three vols. (a work of great interest, and still very popular); and *Patchwork*, in three vols., published in 1841. He was a fellow of the royal societies of London and Edinburgh, and a member of the astronomical society of London. He was the author of

various articles in the scientific journals of the day, and in the *Encyclopædia Britannica*. During the last two or three years of his life he suffered from mental alienation, induced probably by excessive literary work, and was placed in the royal hospital, Haslar, where he remained till his death.

HALL, CHARLES FRANCIS, 1821–71; b. N. H. He was first a blacksmith, then a journalist in Cincinnati, and after that carried on the business of an engraver in the same city. The publication of Dr. Kane's account of the first Grinnell expedition to the arctic regions first awakened his interest in that part of the world, and from that time (1853) to 1860, when he made his first expedition, his leisure was entirely devoted to this engrossing subject. This expedition was the result of his own exertions, and his equipment consisted of two boats, with sledges, the entire outfit being conveyed northward on a small whaler, commanded by capt. Buddington. In spite of the meager character of his resources, the explorer displayed his dauntless and energetic character by his achievements, even in this his first journey. He remained two years in the arctic regions, thoroughly informed himself of the Esquimaux or Innuit habits, continued his exploration until disabled by the loss of his boats, and succeeded in adding 1500 miles of coast line to the charts. Returning home in a whaler, he brought with him "Joe" and "Hannah," two Esquimaux, from whom he continued to receive instructions in the Innuit language, while he made efforts to obtain the necessary means for a second expedition on a larger scale. Through the liberality of Mr. Henry Grinnell, he accomplished his wish, and in 1864 sailed on board the *Monticello*, capt. Buddington. He now passed five years among the Esquimaux, chiefly in King William's land, and at Repulse bay and Pelly bay. The object of these two expeditions was to obtain tidings of the lost Franklin expedition, and in this capt. Hall was so far successful as to obtain many relics of the crews of the *Erebus* and *Terror*. He received much information from the natives, and even gained possession of a skeleton, which was afterwards forwarded to England. Hall returned in 1869, and remained in the United States eighteen months, preparing for the publication of the account of his explorations, delivering lectures, and endeavoring to interest the U. S. government in the prosecution of still another expedition—this time, with the design of reaching the North Pole if practicable. He was fortunate in infusing some of his own enthusiasm into the prominent members of the government, and in 1870 the *Polaris* was fitted out for his use, and sailed on July 3 of that year. Most unhappily, capt. Hall died on Nov. 8, 1871, and the expedition came to an abrupt conclusion. The *Polaris* was abandoned in the ice, and a portion of her crew under capt. Tyson, floated 195 days on a floe, before being rescued. Hall was buried in the ice, on the coast of Greenland. The history of capt. Hall's three expeditions will be found in *Arctic Researches* (1864), and in two volumes published from his manuscripts by order of the U. S. government.

HALL, CHARLES HENRY, D.D.; b. Ga., 1820; educated at Phillips academy, Andover, Mass., and graduated at Yale, soon after which he entered the ministry of the Protestant Episcopal church in Charleston, S. C. After useful service as a rector of a church in Washington, D. C., he became rector of the church of the Holy Trinity in Brooklyn, where his ministry has been noted for vigor, earnestness, and large success. He has published *Commentaries on the Gospels*, *True Protestant Ritualism*, and *Spina Christi*.

HALL, DOMINICK AUGUSTINE, 1765–1820; b. S. C. In 1806 he was district judge in the territory which was afterwards the state of Louisiana, and after the state was organized he continued in the same office until near the time of his death. His name became widely known in consequence of his arrest by gen. Jackson for trying to release by habeas corpus a military prisoner. Jackson was fined $1000 for contempt of court, and paid it. Nearly 30 years later congress repaid the fine with interest.

HALL, GORDON, 1784–1826; b. Tolland, Mass; graduated at Williams college, 1808; ordained at Salem, 1812, and sailed Feb. 18 for Calcutta as a missionary of the A. B. C. F. M. The East India company refusing him permission to remain in its territory he sailed for Bombay, arriving Feb. 11, 1813. Being ordered by the governor-general to leave for England, he presented the cause of the heathen with such power that he was allowed to remain. He possessed great vigor of intellect and force of character, indomitable courage, and a heart consecrated to missionary work. His *Appeal in Behalf of the Heathen*, and *The Conversion of the World*, or *Claims of Six Hundred Millions*, made a profound impression. After laboring 13 years, and completing the revision of the New Testament in Mahratta, he died of cholera, after a few hours' sickness, in Bombay.

HALL, JAMES, 1793–1868; b. Penn.; studied law, but joined the army in 1812, and in the war with Great Britain distinguished himself in engagements at Lundy's Lane, Niagara, and Fort Erie. On the conclusion of the war he accompanied an expedition against Algiers, but in 1818 he resigned his commission, and continued the study of law at Pittsburg. In 1820 he removed to Shawneetown, Ill., where he commenced practice at the bar, and also edited the *Illinois Gazette*. Soon after he was appointed public prosecutor of the circuit, and in 1824 circuit judge. On the abolition of the latter office four years afterwards he was appointed state treasurer, but he continued at

the same time his legal practice, and also edited the *Illinois Intelligencer*. Subsequently he became editor of the *Western Souvenir*, an annual publication, and of the *Illinois Monthly Magazine*, afterwards the *Western Monthly Magazine*.

HALL, JAMES, LL.D., b. Mass. 1811. A distinguished geologist and palæontologist. Intending at first to follow the medical profession, his attention was diverted to natural history, which study he followed in the Rensselaer Polytechnic institute, Troy, N. Y., where he became professor of geology. In 1837 he commenced the series of explorations as one of the geologists appointed for the survey of the state of New York, describing the results of his work in annual reports, the last of these being one of the quarto volumes of the *Natural History of the State of New York*. Being appointed palæontologist to the state of New York, Dr. Hall devoted himself to the preparation of the magnificent series of volumes on that subject, which have been published at intervals since 1847. He also contributed largely to national reports of surveys (Fremont, Stansbury, etc.), and has written voluminously on many important disputed questions in geology and palæontology. The palæontological section of the state cabinet of natural history at Albany, N. Y, was for many years in Dr. Hall's charge.

HALL, JOHN, D.D., b. Ireland, 1829; educated at Belfast college; licensed at 20 years of age to preach, and began as a missionary (Protestant) in the w. of Ireland. In 1852 he was pastor of a Presbyterian church in Armagh, and in 1858 was a minister in Dublin. The queen gave him the appointment of commissioner of education for Ireland. In 1867 he was a delegate from Ireland to the Presbyterian churches of the United States. In 1867 he became pastor of the Fifth avenue Presbyterian church, New York city, where he became so popular that it was found necessary to erect a larger edifice. Dr. Hall has also achieved great popularity as a lecturer. Among his writings are *Family Prayers for Four Weeks*, *Papers for Home Reading*, and *Questions of the Day*. He has a widespread reputation for pulpit eloquence.

HALL, JOSEPH, an English bishop, remarkable for his learning, piety, and misfortunes, was born in 1574 at Ashby-de-la-Zouch, Leicestershire. He was educated at Emanuel college, Cambridge, of which he became a fellow. Entering the church, he became, in 1617, dean of Worcester, was one of the English deputies to the synod of Dort, was consecrated bishop of Exeter in 1627, and in 1641 was translated to Norwich. The latter years of his life were saddened by persecution. He was accused of Puritanism, though he zealously defended the Espiscopacy. By attacking the Arminianism of archbishop Laud, he is said to have "exposed himself to the malignant and wanton attacks of that primate and his crew." In 1641, having joined the prelates who protested against the validity of all laws passed during their forced absence from parliament, he was committed to the Tower, and threatened with prosecution for high treason, but was set at liberty, at the end of seven months, on finding bail for £5,000. On his return to Norwich, he found his revenues sequestrated and his property pillaged. He rented a small farm at Higham, near Norwich, to which he retired, 1647, and died in 1656, aged 82 years. His works, mostly of a controversial character, have been published in folio quarto, and octavo. A new edition, with autobiography, notes, etc., was published by the Rev. Josiah Pratt (Lond. 10 vols. 1808); a later edition by the Rev. Peter Hall, a descendant of Joseph (Oxford, 12 vols. 1837–9). His writings most interesting at the present time are poetical *Satires*, written at college, which Pope, no mean judge of that species of composition, affirms to be "the best poetry and the truest satire in the English language." Hallam, however, (*Lit. Hist. of Europe*), accuses him of being "harsh and rugged," and asserts that "his lines frequently bear no visible connection in sense or grammar with their neighbors." Among his other works are *Contemplations*, *Art of Divine Meditation*, and *Enochismus, or Treatise on the Mode of Walking with God*.

HALL, LYMAN, 1725–90; b. Conn.; a signer of the declaration of independence; graduate of Yale and a physician. He was a member of congress from Georgia, and governor in 1783. While Georgia was subject to English rule his entire property was confiscated.

HALL, MARSHALL, an eminent physiologist and physician, was b. at Basford, Nottinghamshire, in 1790, and died at Brighton in 1857. At the age of 20 (having been previously apprenticed to a chemist) he entered on the study of medicine at the university of Edinburgh, where, in 1812, he took his degree of M.D. After three years' subsequent attendance at the leading schools of medicine on the continent, he commenced practice in Nottingham in 1815, and rapidly obtained a high provincial reputation. In 1826 he removed to London, where his career as a physician was so successful, that he was enabled at the age of 60 to release himself from strictly professional labor. Among his contributions to physiology must be mentioned his *Essay on the Circulation of the Blood*, published in 1831, in which he made known his discovery of the remarkable "caudal heart" connected with the vessels in the tail of the eel; his paper "On the Inverse Ratio which subsists between the Respiration and Irritability in the Animal Kingdom," in the *Philosophical Transactions* for 1832; and the articles "Hybernation" and "Irritability" in Todd's *Cyclopædia of Anatomy and Physiology*. But his name is best known in connection with the doctrine of the reflex function of the nervous system,

which was his most engrossing subject of pursuit for the last twenty-five years of his life. In the *Philosophical Transactions* for 1833 appeared his "Memoir on the Reflex Function of the Medulla Oblongata and Medulla Spinalis." His views on the subject of this memoir were extended and corrected in various publications, amongst which may be especially mentioned his *Lectures on the Nervous System and its Diseases* (1836), *Memoirs on the Nervous System* (1837), *New Memoir on the Nervous System* (1843), and *Synopsis of the Diastaltic Nervous System* (1850). There has been much discussion as to Hall's claims to be considered the discoverer of reflex action. He admitted that the phenomena of which he treated had been long known to physiologists, but he believed himself to have been the first to show their independence of sensation, to bring them together under one generalization, to establish with precision the laws of their production, to assign them their just rank in physiology, and to apply the doctrine to the elucidation of disease. His more strictly professional writings are many and valuable; they appear partly as independent publications, and partly in the medical journals. His last bequest to the science of medicine and the cause of humanity, was the description of a simple and easily applied method of restoring suspended respiration, which has been the means of saving many from untimely death, and is known as THE MARSHALL HALL METHOD. It is briefly described in the article ASPHYXIA. His memoirs, with a large collection of his letters, have been published by his widow.

HALL, NEWMAN, LL.B.; b. England 1816; an English clergyman, having a charge at Hull, and later, pastor of the "Rowland Hill" chapel in London. He was a firm advocate of the union cause during the war of the rebellion in the United States, coming here, speaking in the loyal interest, and preaching before congress. In 1866 he was president of the Congregational union. He is widely known as an earnest advocate of total abstinence, upon which he has delivered many sermons and lectures. In 1873 he made a second American visit and lectured in many of the large cities. Some of his works are *The Christian Philosopher, The Land of the Forum and the Vatican, Lecture on America, From Liverpool to St. Louis, Pilgrim Songs*, etc.

HALL, Rev. ROBERT, a celebrated English dissenting preacher and writer, was b. at Arnsby, near Leicester, May 2, 1764. He was the son of a Baptist minister of some note as a preacher and author of religious works, and was the youngest of fourteen children. He was feeble in body and precocious in intellect, learning to read almost as soon as he could speak, from the tombstones of the churchyard, his playground. At the age of 15, he was sent to a Baptist academy at Bristol, when he gave promise of his future fame as an orator, but, from his nervous organization, broke down in his first public efforts. In 1781 he entered King's college, Aberdeen, where he remained four years. An intimate companionship with Mackintosh, in which they read and discussed together philosophy and theology, was of great service to him. Graduating in 1785, he became, at the age of 21, assistant Baptist minister and tutor in the academy at Bristol. He was a fluent, rapid, and impressive speaker, and was liberal, but not heterodox in his religious views. In consequence of a disagreement with his colleague, he went in 1790 to Cambridge, where, by his elaborate composition and vivid eloquence, he rose to the highest rank of British orators. He is not less distinguished for his writings and published discourses, than as a pulpit orator. His *Apology for the Freedom of the Press*, 1793, and sermon on *Modern Infidelity*, extended his reputation. In 1806 he settled in Leicester; married in 1808, after a whimsical courtship; returned to Bristol in 1825, and died Feb. 21, 1831. He was an indefatigable student, learning Italian at 60, that he might enjoy Dante, and full of wit, fun, and a spontaneous eloquence, so that the style of his improvisations was superior to that of his writings. Nearly all his life he suffered the tortures of an obscure disease of the spine; he had at times attacks of insanity, and his death was preceded by great agony, caused by a large calculus in one of his kindeys; yet few men have performed more intellectual labor. A complete edition of his works, with a memoir by Dr. O. Gregory, and observations on his character as a preacher by John Forster, was published at London, in 6 vols., 1831–33; 11th edition, 1853.

HALL, SAMUEL CARTER; b. England 1800; studied law, but turned his attention to literature. He was a reporter of parliamentary debates, and afterwards editor of Colburn's *New Monthly Magazine*. For several years, with the able assistance of his wife, he wrote and complied the *Annuals* once so popular in England and America, and many other works. In 1839 he edited the *Art Journal*. Among his works are *A Book of Memoirs of Great Men and Great Women, Book of British Ballads, Baronial Halls*, etc. Mr. Hall has always been devoted to charitable objects, and has assisted in the foundation of eminent public establishments of this character.

HALL, or SWÄBISCH-HALL, an old and picturesque t. in the kingdom of Würtemberg, is very beautifully situated in the deep valley of the Kocher, 35 m. n.e. of Stuttgart. It is surrounded by a ditch and by high walls surmounted with towers. Like other places in whose names the word Hall or Salz occurs, Hall has considerable saltworks, which, together with those of Wilhelmsglück, produce annually nearly 80,000 cwts. There are also tan-works, soap-works, and manufactoires of cotton goods and *bijouterie*. Pop. '75, 8,430.

Hall at a very early period was the seat of a mint, and the coins first struck here

were called Heller (Häller). The town belonged first to the counts of Westheim, then later to the Knights Templar. In the 13th c. it became a free imperial town, and such it remained till 1802, when, with its territory of 126 sq.m. (pop. 16,000), it was added to the kingdom of Würtemberg.

HAL'LA, or HALA, a t. of Hindustan, in the country of Sinde, is situated on the left bank of the lower Indus, 35 m. n. of Hyderabad. Manufactures of caps, superior colored earthenwares, and lacquered work, are extensively carried on here. Pop. '72, 4,096, the most of whom are manufacturers. Halla is said to be the most ancient city of Sinde.

HALLAM, ARTHUR HENRY, 1811-33; son of Henry Hallam, the historian; b. London. He was educated at Eton college, and in 1833 went with his father on a tour in Europe, but died a few weeks afterwards in Vienna. He was engaged to be married to a sister of Alfred Tennyson, and his death was the motive of the remarkable poem *In Memoriam*.

HALLAM, HENRY, philosophic historian and critic, son of the dean of Bristol, was b. at Windsor in 1777, and educated at Eton and Christ church, Oxford, where he took his degree of M.A. He was first known by his writings in periodicals, especially by contributing to the *Edinburgh Review* during its early years; afterwards, he was distinguished among the literary men of Europe for his extensive and profound learning, powers of generalization, taste, judgment, conscientiousness, exhibited in a succession of great works: *View of the State of Europe during the Middle Ages* (2 vols. 4to, 1818); *The Constitutional History of England from the Accession of Henry VII. to the Death of George II.* (2 vols. 4to, 1827); and *Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries* (4 vols. 8vo, 1837–39), and a volume of supplementary notes to his *History of the Middle Ages* (1848). All these works have gone through several editions, and been translated into the languages of the leading European nations. They have procured for their author the enviable reputation of having opened up a new and great field of authorship, and labored in it with a success that as yet has not been equaled by another. Their wonderful impartiality and veracity are a rebuke to ordinary historians; and it provokes a smile to read, at this distance of time, the strictures of Southey on the acrimony, the arrogance, the injustice, and the ill-temper of their author; for England never produced a man who loved truth more disinterestedly than Hallam. Hallam, while yet a young man, was held in the highest estimation among the literary men of his time, both in London and Edinburgh. During the greater portion of his long life, however, he lived in London in privacy, devoting himself to linguistic and historical studies. In politics, he was a whig; but for the conflict of parties he was unsuited by his candor and general temperament, and took no part in them, but he displayed a genuine interest in all questions of social improvement, and acted with the Wilberforce party for the abolition of slavery, as well as in other humane schemes, and was one of the original promoters of the society for the diffusion of useful knowledge. Hallam had two sons, both of great promise, and both prematurely cut off; the elder, Arthur Henry, who died in 1833, was the friend of Alfred Tennyson the laureate, and is the subject of *In Memoriam*. Of this son, Hallam wrote a touching memoir. Hallam died Jan., 1859. He was a fellow of the royal and many other societies, and a trustee of the British museum.

HALLAMSHIRE, a district in the West Riding of Yorkshire (q.v.).

HALLE, a city of Prussian Saxony, in the district of Merseburg, known as *Halle an der Saale*, to distinguish it from other places of the same name, is situated on the right bank of the Saale, and on several small islands of the river, 20 m. w.n.w. of Leipsic. In the old town, the streets are narrow and crooked. As an important railway center, Halle has of late years rapidly increased in size, industry, and prosperity. Its famous university was founded in 1694 by Frederick I., king of Prussia; and after having been suppressed by Napoleon when it had attained the summit of its fame, was re-established in 1815, and incorporated with the university of Wittenberg, which had been dissolved during the war. At first a chief seat of the pietistic school of theology, Halle subsequently became the head-quarters of rationalism and criticism. The roll of its professors shows a long array of names distinguished in every faculty. There are attached to the university a theological and a pedagogical seminary, an agricultural institute, an observatory, surgical wards, an anatomical theater, and botanical garden; and a library containing 100,000 volumes, and various scientific collections. The endowments for the professors and lecturers (over 100 in number) are liberal. The students in attendance number ordinarily between 800 and 900. The Francke institution is one of the most important establishments of the place. See FRANCKE. The red tower on the market-place, the town-hall, and the remains of the Moritzburg, the ancient residence of the archbishops of Magdeburg, are all interesting to the antiquary. Halle is amply provided with benevolent and educational establishments for the poor, and has a well-conducted institution for the blind, deaf and dumb, and insane, with free schools for both sexes; and as the chief town of a district, is the seat of various government offices and courts of jurisdiction. Halle has manufactories of woolen and linen fabrics, gloves, buttons, hardware, and starch; but its most important industrial product is salt,

obtained from the brine-springs within and near the town, which have been worked from a very early period, and still yield between 200,000 and 300,000 cwts. annually. Those within the town are worked by a private company, while the suburban works are held by government. The men employed at the salt-springs, and known as the "Halloren," are a distinct race, supposed by some to be of Wendish, and by others of Celtic descent, who have retained numerous ancient and characteristic peculiarities. Pop. '71, 52,639; '75, 60,503.

Halle, originally a border fortress against the Slavs, became in the 10th c. an appanage of the archbishops of Magdeburg, and by the 12th c. was famous as a commercial city. In the 12th and 13th centuries Halle was a powerful member of the Hanseatic league, and waged war with neighboring potentates. Terribly impoverished during the thirty years' war, Halle was incorporated with the dominion of the elector of Brandenburg at the peace of Westphalia.

HALLÉ, CHARLES, an eminent pianist, was b. at Hagen, in Westphalia, in 1819; studied first at Darmstadt, and afterwards at Paris, where his reputation was established by his concerts of classical music. He afterwards settled in England, where his time has been principally divided between London and Manchester. In purity of style, he is considered almost without a rival, and the best living interpreter of Beethoven. His aim has ever been to raise the popular standard of musical taste, an object in which he is believed to have achieved no small success in London, Manchester, and elsewhere.

HALLÉ, or HALLEIN, a t. of Austria, in the duchy of Salzburg, and 10 m. s. of the town of that name, is situated on the right bank of the river Salza, and is noted for its extensive salt works and saline baths. Pop. '69, 3,614. It has also important cotton and needle and button factories. The Dürrenberg, a mountain 2,388 ft. above the level of the sea, from which the brine is obtained, has 34 shafts or rooms, from which the salt is conveyed in large wooden troughs to the works within the town. The annual produce amounts to about 200,000 cwts. Good rock-salt is also obtained from Dürrenberg.

HALLECK, FITZ-GREENE, an American poet, b. at Guilford, Conn., in 1790. By his mother, Mary Eliot, he was descended from John Eliot, "the apostle of the Indians." He became a clerk in a bank in New York in 1813, in which employment he remained for many years. He was afterwards for a considerable time the confidential agent of Mr. John Jacob Astor in his commercial affairs, and was appointed by him one of the original trustees of the Astor library in New York—a position which he held to the end of his life. In 1849 he retired from banking and mercantile pursuits, and took up his residence in his native place, where he spent the remainder of his days. From his boyhood, Halleck wrote verses, some of which he sent to newspapers; but in his collected poems, he has included nothing published earlier than his lines on *Twilight*, which appeared in a New York paper in 1818. In the following year, he became associated with Joseph Rodman Drake in contributing the humorous series of *The Croaker Papers* to the same journal. The illness of Drake soon put an end to these papers, and Halleck commemorated his friend's death in a very beautiful little poem. In 1819 Halleck wrote his longest poem, *Fanny*, a satire on the literature, fashions, and politics of the time, in the measure of *Don Juan*. It is said to have occupied less than three weeks in its composition, and derived its immediate and great popularity rather from the pungency of its allusions than from any higher merit. In 1822-23 Halleck visited Europe; and in 1827 published an edition of his poems, in which were included several pieces suggested by the scenes and associations of the old world, among which the lines on Alnwick castle and on Burns particularly commanded admiration. Halleck's style is spirited, flowing, and graceful; his versification almost always very smooth and harmonious. His poems display much geniality and tender feeling. Their humor is delicate and refined. Few poets, and particularly few American poets, who have written well and acquired popularity like Halleck, have written so little. His whole poems are included in a 12mo. volume of very moderate size. Halleck died Nov., 1867.

HALLECK, HENRY WAGER, an American gen., b. in 1816, at Westernville, in the state of New York. He entered West Point military academy in 1835, graduated in 1839, and for about a year acted as assistant professor of engineering. During the Mexican war he served on the lower coast of California, and, for his gallant services, was brevetted captain in 1847. From 1847 to 1849 he was secretary of state for California, under the military government of Kearney, Mason, and Riley; and in 1849 was a member of the convention to form and draft the state constitution of that province. He became capt. of engineers in 1853, left the service in 1854, and for some time practiced law in San Francisco. On the outbreak of the civil war he joined the northern army in 1861 as maj.gen., and in Nov. of the same year was appointed commander of the department of the west. In 1862 he became general-in-chief, resigning in 1864, and becoming chief of the staff. As a general, he was able and successful. He died in Jan., 1872. He wrote *Elements of Military Art and Science* (1846), *Mining Laws of Spain and Mexico*, etc.

HALLEL, signifying *praise*, is a name given to a part of the Jewish hymnal service which was chanted both in the temple and the family. It consists of Ps. cxiii—cxviii. It

is called the *Egyptian hallel* because the paschal lambs were slain while it was chanted. Another hallel is called the *great hallel* and designates the response repeated after every verse in Ps. cxxxvi. The *Egyptian hallel* was chanted for 20 days in the year in the temple at the celebration of the passover and other festivals. It was chanted also in private families on the first evening of the passover. The singing of the hymn by Christ and the disciples at the close of the passover supper is supposed to be the second part of this hallel, comprising Ps. cxv. and cxvi., which was chanted while drinking the fourth and last cup. The great hallel was chanted on special joyful occasions. The Egyptian hallel is now recited by the Jews at all the feasts but new year, the day of atonement, the last six days of the passover, and the new moon. It is uncertain when this service was instituted, different Jewish writers ascribing it to Moses, Joshua, David, Deborah, Hezekiah and others. Maimonides and Buxtorf have written extended but not entirely satisfactory works on the subject.

HALLELU'IAH (Heb. *Praise ye the Lord*), one of the forms of doxology used in the ancient church, derived from the Old Testament, and retained, even in the Greek and Latin liturgies, in the original Hebrew. The singing of the doxology in this form dates from the very earliest times; but considerable diversity has prevailed in different churches and at different periods as to the time of using it. In general it may be said that, being in its own nature a canticle of gladness and triumph, it was not used in the penitential seasons, nor in services set apart for occasions of sorrow or humiliation. In the time of St. Augustine, the African church used the halleluiah only from the feast of Easter to that of Pentecost. In other churches, it was found in most of the services throughout the year, with the exception of the seasons of Lent and Advent and the vigils of the principal festivals. In the Roman Catholic church, the halleluiah is introduced both into the mass and into the several hours of the public office, but it is discontinued from Septuagesima Sunday until Easter; and on the contrary, during the interval between Easter and Pentecost, it is introduced more frequently into the services and in circumstances of greater solemnity. It is always omitted in the services for the dead, and on the ember days, at the quarter tense, and on the principal vigils. In the church of England, the first prayer-book of Edward VI. retained the halleluiah in the original Hebrew. In the present prayer-book, although retained, it is found not in the Hebrew, but in its English equivalent, *Praise ye the Lord.* See Binterim's *Denkwürdigkeiten der Christ-Kathol. Kirche.*

HALLER, ALBRECHT VON, an eminent physiologist, was b. at Bern, Oct., 1708, and died in that city, Dec. 17, 1777. In early life he was feeble and delicate, being affected with rickets, a disease which is not unfrequently accompanied with considerable intellectual precocity. His father, Nicholas Emmanuel von Haller, who was an advocate, and had the reputation of being an able lawyer, intended him for the church; but his own inclinations being in favor of medicine, he proceeded in 1723 (two years after his father's death) to the university of Tübingen, where he became the pupil of the well-known anatomist Duvernoy. In 1725 he removed to Leyden, where he attended with much advantage the lectures of Boerhaave and of Albinus, and obtained the degree of doctor of medicine in 1727. He then visited London, where he made the acquaintance of Sloane, Douglas, and Cheselden, whence he proceeded to Oxford, and afterwards to Paris, where for six months he studied anatomy and botany under Winslow and De Jussieu; but one of his neighbors, who was annoyed by his dissections, having threatened to denounce him to the police, he made a rapid retreat to Basel, where he became the pupil of John Bernoulli, the celebrated mathematician. After seven years' study in these different seats of learning, he returned, in his 22d year, to his native city and commenced practice as a physician. The professor of anatomy, Meig, having fallen ill, Haller undertook the duties of his class; he likewise devoted much of his time about this period to the botany of the Alps; and also published a celebrated descriptive poem, entitled *Die Alpen* (The Alps). In 1735 he was appointed physician to the hospital, and shortly afterwards, principal librarian and curator of the cabinet of medals; but these offices he did not hold long, for in 1736, George II., wishing to establish a university at Göttingen, offered him the professorship of medicine, anatomy, botany, and surgery, which after some hesitation, he accepted. From this time he gave up the practice of his profession, and for the next 18 years devoted himself wholly to teaching and to original research. He took an active part in the formation of the royal academy of sciences of Göttingen; and the memoirs of the society, which appeared under the title of *Commentarii Societatis Regiæ Scientiarum Gottingensis*, contain many of his papers. During the period that he held the professorship—viz., from 1736 to 1753—he composed and published 86 works on medical subjects, chiefly on physiology and botany; and it is recorded that he contributed upwards of 12,000 notices or reviews of books to the *Göttingische gelehrte Anzeigen*, a monthly periodical work, of which he was editor. In 1753, in consequence of disputes with his colleagues, and probably in part from the delicate state of his health, he resigned his chair, and returned to his native town, where he subsequently held several important and honorable offices. He still, however, retained his position as president of the royal academy of sciences, and other more substantial distinctions, such as a retiring allowance, etc. It was after his retirement from Göttingen that some of his most important writings were published

amongst which must be especially mentioned his *Elementa Physiologiæ Corporis Humani* (Lausanne, 8 vols. 4to, 1757–66)—by far the most important of his works—and his four *Bibliothecæ*, or critical catalogues of works on botany, surgery, anatomy, and medicine. The increasing maladies of his later days did not distract his mind from the study of his favorite subjects. He recorded all the symptoms of his last illness—a combination of gout and disease of the bladder—and the gradual cessation of his vital functions; and his last words, addressed to his physician, were: "My friend, the pulse has ceased to beat."

Haller's eminence as a man of science was duly recognized even in his own lifetime. In 1739 he was appointed physician to the king of Great Britain; he was ennobled by the emperor of Germany in 1748; the universities of Berlin, Oxford, and Utrecht in vain endeavored to obtain him as their professor; and he was an honorary member of all the scientific societies of Europe. His name is especially connected with the doctrine of muscular irritability, which is noticed in the article MUSCLE AND MUSCULAR TISSUE; and if he made but few positive additions to our knowledge, his teaching and writings impressed a new aspect on physiology—a science of which he has deservedly been termed "The Father." But, while his name is indelibly recorded in the annals of science, it should also be remembered that by his work as poet, Haller greatly contributed to the movement which towards the end of the 18th c. brought new life to German poetry.

HALLEY, EDMUND, a celebrated astronomer and mathematician, son of a London soap-boiler, b. at Haggerston, near London, in 1656, educated at St Paul's school, and afterwards at Queen's college, Oxford, which he entered in 1673. He early became an experimenter in physics—before leaving school, he had made observations on the variation of the needle. In 1676 he published a paper (*Philosophical Transactions*) on the orbits of the principal planets; also observations on a spot on the sun, from which he inferred its rotation round its axis. In Nov. of the same year he went to St Helena, where for two years he applied himself to the formation of a catalogue of the stars in the southern hemisphere, which he published in 1679 (*Catalogus Stellarum Australium*). On his return he was chosen a fellow of the royal society, and deputed by that body to go to Dantzic to settle a controversy between Hooke and Helvetius respecting the proper glasses for astronomical observations. In 1680 he made the tour of Europe, during which he made observations with Cassini at Paris on the great comet which goes by his name, and the return of which he predicted. His observations on this comet formed part of the foundation of Newton's calculation of a comet's orbit. Halley returned to England in 1681, and in 1683 published (*Phil. Trans.*) his theory of the variation of the magnet. The next year he made the acquaintance of Newton—the occasion being his desire for a test of a conjecture which he had made that the centripetal force in the solar system was one varying inversely as the square of the distance. He found that Newton had anticipated him, both in conjecturing and in demonstrating this fact. For an account of Halley's connection with the publication of the *Principia*, see NEWTON. In 1686 Halley published an account of the trade-winds and monsoons on seas near and between the tropics, which he followed by some other chemico-meteorological papers. In 1692 he published his hypothesis relative to the change in the variations of the needle, to test the truth of which, by obtaining measures of the variations in different parts of the world, he was sent in 1698 in command of a ship to the western ocean; but his crew mutinied, and he was obliged to return. The next year, however, he sailed again on the same expedition, and the result of his observations was given to the world in a general chart, for which he was rewarded by the rank of captain in the navy with half-pay for life. Soon after he made a chart of the tides in the channel, and surveyed the coast of Dalmatia for the emperor of Austria. On the death of Dr. Wallis in 1703 he was appointed Savillian professor of geometry at Oxford. In 1705 he published his researches on the orbits of the comets. In 1713, on the death of Sir Hans Sloane, he became secretary of the royal society; in 1716 he made valuable experiments with the diving-bell, which were afterwards published; and in 1720, after the death of Flamsteed, he became astronomer-royal, and continued without assistance to conduct the operations at the observatory with unremitting energy. In this office, and engaged especially in studying the moon's motions, he passed the rest of his life. In 1729 he was chosen a foreign member of the academy of sciences, Paris. He died at Greenwich, Jan. 14, 1742, 86 years old. Halley had married, in 1686, a daughter of Mr. Tooke, auditor of exchequer, by whom he had several children. Besides the writings mentioned, Halley wrote many others. His *Tabulæ Astronomicæ* did not appear till 1749. Among his principal discoveries may be mentioned that of the long inequality of Jupiter and Saturn, and that of the slow acceleration of the moon's mean motion. He has the honor of having been the first who predicted the return of a comet, and also of having recommended the observation of the transits of Venus with a view to determining the sun's parallax—a method of ascertaining the parallax first suggested by James Gregory.

HALLEY'S COMET. See COMET.

HALL, HALLE, AND **HALLEIN,** are the names of various places in southern and middle Germany, possessing *salt-works*. *Hall* is also a general name for a salt manufacture. The Welsh and Armorican word for salt is *hal, halen;* hence it is inferred that these

names were bestowed by Celtic tribes of the Cymric division (to which the ancient Gauls belonged). The Gaelic for salt is *sal-ann*, agreeing thus with the Latin *sal*, and the German *salz*. The Greek *hals* (ἅλς) agrees with the Cymric. The names Salza, Salzburg, are clearly of Teutonic origin.

HALLIWELL, JAMES ORCHARD, b. England, 1820; especially noted as an archæologist and writer on Shakespeare. He has published, among other works, *Life of Shakespeare, Descriptive Calendar of the Records of Stratford-on-Avon, An Account of the New Place* (Shakespeare's residence) *at Stratford-on-Avon*, an immense edition of *Shakespeare's Works* in 16 quarto vols.; *Illustrations of the Life of Shakespeare in a Discursive Series of Essays, Dictionary of Archaic and Provincial Words, Popular Rhymes and Nursery Tales*, etc.

HALLOCK, WILLIAM ALLEN, D.D., 1794–1880, son of rev. Moses; b. Plainfield, Mass., graduated at Williams college and Andover theological seminary, ordained 1826. He founded the American tract society at New York, 1825, was for 45 years its secretary and general agent, and in its service for more than 50 years. His mind was clear and vigorous; and his rare industry and efficiency appear in the fact that nearly 4,000 publications, including 881 volumes, were examined and prepared by him line by line for the press. About the same number passed under his eye for approval for translation, and with the aid of the society's funds, were printed at mission stations in 145 different languages and dialects. He was the author of tracts and books, of which in all 1,400,000 copies were circulated in his life time.

HAL'LOWELL, a city in Maine, U. S., on the river Kennebec, 2 m. s. of Augusta. It has a town-hall, 6 churches, 3 banks, 1 newspaper office, a cotton-factory, etc. It is best known abroad from the fine quality of granite in the neighborhood. Steam-boats and vessels of 9 feet draught can load. Pop. '70, 3,007.

HALLOW-EVEN, or HALLOWEEN, the name popularly given to the eve or vigil of All Hallows, or festival of All Saints, which being the 1st of Nov., Halloween is the evening of the 31st of Oct. In England it was long customary to crack nuts, duck for apples in a tub of water, and perform other harmless fireside revelries. While the same thing can be said of Scotland, the Halloween ceremonies of that country partook more of a superstitious character; taking, among rustics, the form of a charm to discover who should be his or her partner for life. Of these now almost exploded customs, the best summary is that contained in Burns's well-known poem *Hallowe'en*. We refer to Brand's *Popular Antiquities* for some notice of old Hallow-even practices.

HALLUCINA'TIONS are morbid conditions of mind in which perception takes place where no impression has been made upon the external organs of the special senses, and where the object is believed to be real and existing. A picture is presented to the imagination when no ray of light has fallen upon the eye; a voice is heard when all around is silent; a pleasant smell fills the nostril when neither flowers nor feast give forth their fragrance. Delusions, on the other hand, originate at the other extremity of the chain of consciousness in the mind itself, and consist in erroneous interpretations of real sensations. A form passes across the vision, and it is regarded as a phantom, or a demon, or what is not and cannot be; a voice may address the listener in accents of tenderness and friendship, which before they reach the mind have assumed the shape of insults and calumnies; and the fresh odor of a rose may suggest notions of poison and pollution. But hallucinations may involve internal experiences as well as the reports from the outer world; nor is it invariably possible or necessary to distinguish hallucinations from delusions. There is a composite state in which the external impression is imaginary, and the interpretation from such an impression, had it been real, is erroneous. A clock is heard by a patient to strike where not a sound is audible by others, and the chime is held to be the announcement of the crack of doom. In all these cases, the sensorium itself must be held to be at fault, whether the nerves of seeing, hearing, etc., be structurally affected or not. These phenomena are observed in connection with all the senses, but in different proportions; the frequency being perhaps in relation to the number of healthy sensations of which the organ is the natural channel, and to the degree of excitement and cultivation to which it is ordinarily subjected. According to one authority, hallucinations of hearing constitute two-thirds of the whole observed; but, upon a more careful analysis, the following tabular expression of frequency appears to be correct: hallucinations of hearing, 49; of vision, 48; of taste, 8; of touch, 3; of smell, 1. These conditions are detectable in all mental diseases; but the proportion varies according to the form and the intensity of the alienation. All are more frequent in mania than in monomania and fatuity; and errors of vision are more numerous than those of hearing in mania. Lord Brougham at one time held that the presence of hallucinations should be elected into a crucial test of the existence of insanity. Practical men, however, demonstrate that derangement is not necessarily conjoined with such a symptom. Esquirol held that of 100 lunatics, four-fifths would be affected with hallucinations. Of 145 individuals in Bicêtre, Baudry found that 56 presented hallucinations; and the subsequent researches of Thore and Aubanel in the same hospital showed 122 affected out of 443 maniacs, monomaniacs, dements, etc. Brière de

Boismont, *Des Hallucinations* (Paris, 1845); Aubanel and Thore, *Recherches Statistiques faites à l'Hospice de Bicêtre;* Michéa *Du Délire des Sensations* (Paris, 1848).

Hallucinations of Sane Men.—In a great majority of cases, hallucinations can readily be traced to mental alienation, which is cognizable by other signs, or to conditions of the nervous system, which impair or pervert without overthrowing the mind; or to general constitutional states, or positive diseases, such as in the case of Nicolai, which involve disturbance of the functions of the external senses. There is, however, a class of phenomena which cannot be included under any of these categories; where objects appear; voices tempt, threaten, soothe, or where a series of impressions are received by the mind, without any corresponding sensation; where the system is perfectly healthy, and where the individual affected is conscious that what he sees or hears is unreal. Medical experience, however, goes to show that under such circumstances the nerve, or some organ connected with the development of special sensation, or the brain itself, is in an abnormal or excited condition, which falls short of disease, not interfering with the regular discharge of the ordinary functions of these parts of the economy, and not being detectable in any other way, and which is sometimes compatible with great intelligence, and even genius. As illustrative of the latter proposition, and of the least morbid aspect of such phantasmata, it may be mentioned that the late earl Grey was haunted by a gory head, which he could exercise at will. Swedenborg, while at the head of the government, saw members of the heavenly hierarchy seated among the ministers at the council board, and bowed reverentially to them. Bernadotte encountered a woman in a red cloak in his rides; and a patient has been described who was followed first by a cat, then by a tatterdemalion beggar, and then by a skeleton which never left him, walked side by side, joined his family circle, and peered through his curtains at night. Yet Swedenborg knew that it was not flesh and blood realities he acknowledged; the king shrunk from, but repudiated the red cloak; and the patient disbelieved the skeleton, and detected its true nature and origin.

HALLUIN, a t. of France, in the dep. of Nord, 10 m. n.n.e. of Lille. Weaving, bleaching, cotton-spinning, and brick-making are carried on, and there are manufactures of linen and calico. Pop. '76, 8,584.

HALMSTAD, a t. in Sweden, on the e. shore of the Cattegat, about 76 m. s.s.e. of Gothenburg, at the mouth of the river Nissa; pop. '75, 7,136. The castle is the residence of the governor of the province. Mention of the church of Halmstad occurs as early as 1462, and the fortifications are mentioned first in 1225. The latter were demolished in 1736. The Dominican and Franciscan monasteries, formerly in the town, are now quite destroyed. The harbor built in 1837–40, at a cost of about £5,250, admits ships of 10 ft. draught, by means of which some trade in deals, pitch, and tar is carried on. The salmon fishery is important. An archæological society holds its meetings in Halmstad, and the popular magazine, *Svenska Family Journalen*, is published there. There are both mineral and sea-water baths in the neighborhood. The oldest town-privileges of Halmstad date from 1307, while the first recorded event in its military history is the battle of Nissa, between Harold Hardrada and Sven Ulfsson. During the revolt of the miner Engelbrekt, it twice fell into the hands of the rebels—in 1434 and 1436. The town appears to have been frequently chosen as the meeting-place of the rulers and delegates of the three northern kingdoms; and under the union of Calmar it was appointed to be the place for the election of a new Scandinavian monarch whenever necessary. The län of Halland formed part of the territory of Denmark in Sweden, and, accordingly, in 1534, during his war with the Danes, Gustavus Vasa assaulted and took its chief town. In 1660, by the treaty of Copenhagen, the whole district was ceded to Sweden. In 1676 Charles XII. defeated near Halmstad a Danish army which was attempting to retake the district, and since that time Halland has formed part of Sweden.

HALMALILLE, *Berrya amonilla*, a tree of the natural order *tiliaceæ*, closely allied to the lime or linden tree of Europe, and much resembling it, but larger; a native of Ceylon, much valued for its timber, which is a favorite house-building wood in that island, and is employed for carts, casks, and all household purposes, and also for boat-building, as it is believed to resist the attacks of marine worms, and in virtue of a certain unctuosity, to preserve the ironwork from rust. It is exported to Madras—where, from the principal port of exportation, it is known as *Trincomali wood*—and the Masula boats, which brave the formidable surf there, are made of it. It is a light wood.

HAL'OGENS. This term, which is equlvalent to "salt-producers," is derived from the Greek word *hals*, salt, and includes a very distinct and well-characterized group of non-metallic elements—viz., chlorine, bromine, iodine, and fluorine, which form with metals compounds analogous to sea-salt.

The following are the most important characteristics:

1. They combine directly and at an ordinary temperature with the metals, for which they exhibit a very strong affinity; and their combinations with the metals present those properties which pertain to salts (q.v.). No elements excepting these four possess the property of entering into direct combination with metals, and of thus forming salt-like compounds. When united with the same metal, the salts which the different halogens

form are isomorphous; thus, for example, the chloride, iodide, bromide, and fluoride of potassium all crystallize in cubes.

2. They all have a very energetic affinity for hydrogen, with which they all unite in one definite proportion—viz., 2 volumes of the gas or vapor of the halogen with 2 volumes of hydrogen, the union occurring without change of bulk, that is to say, being represented by 4 volumes, and the resulting gaseous compound being intensely acid, and very soluble in water. The acids thus formed are hydrochloric, hydrobromic, hydriodic, and hydrofluoric acids. Moreover, all these halogens (except fluorine) form powerful acids with five atoms of oxygen—viz., chloric, bromic, and iodic acids; and their salts present numerous points of resemblance.

HA'LOID SALTS. These are the compounds formed by the union of one of the halogens (q.v.) with a metal. We may mention chloride of sodium (NaCl), bromide of silver (AgBr), fluoride of calcium (CaF), and iodide of potassium (KI), as examples.

HALPINE, CHARLES G., 1829–1868; b. Ireland; graduated at Dublin university; began life as a journalist. In 1847 he came to New York, and was employed on various city papers there and in other cities. He enlisted in the union army early in the war of the rebellion, and rose to be brig.gen. of volunteers. He was also a maj. in the regular army. While in the service, his papers over the signature of "Private Miles O'Reilly" were immensely popular. After the war he was elected register of the county of New York. He published many short poems, and was proprietor and editor of the *Citizen* newspaper, published in New York. He was a brilliant and vivacious writer, and socially a general favorite.

HALORAGIA'CEÆ, or HALORA'GEÆ, a natural order of exogenous plants, closely allied to *onagraceæ* (q.v.).—There are about 70 known species, herbaccous or half-shrubby; pretty much scattered over the world, but almost all aquatic, or growing in wet places. The stems and leaves often have large air-cavities. The flowers are generally small, and the plants insignificant in appearance. Nor have any of them any important uses, except those of the genus *trapa* (q.v.). The only British species are the mare's tail (*hippuris vulgaris*) and the watermilfoils (*myriophyllum*).

HA'LOS, PARHE'LIA, CORO'NÆ, etc. It would not be easy even to enumerate the various distinct phenomena which belong to the above classes; we must, therefore, be content to consider a few only of the principal varieties; and, in fact, if the causes of these be thoroughly understood, those of the others present no further difficulties, except such as are of a purely mathematical nature.

The first class we have to consider is very common. When the sun or moon is partially obscured by a mist or cloud, the latter *not* being of the species called cirrus (see CLOUD), it is almost invariably surrounded by colored rings of a few degrees only in diameter, called *coronæ* (crowns). Those surrounding the sun cannot always be seen directly; but by reflection at the surface of still water, or of a glass-plate blackened at the back, the glare of the sun-light is sufficiently diminished to permit the corona to be seen. This meteor depends on the diffraction (q.v.) of light, caused by the small spheres or vesicles of water which compose the cloud, and can easily be imitated by looking at a bright object through a piece of glass which has been breathed upon, or dusted with lycopodium seed. If the diffracting particles be all of the same size, the rings are very well marked; but since they become smaller as the particles increase in size, ordinary fogs and clouds, which generally contain particles of very different dimensions, give a composite effect, which spoils the distinctness, and greatly limits the number of the rings. Thus, no general rule can be given for the number or colors of the coronæ, but it may be observed that their diminution in diameter is a sign of the increase in size of the watery spheres which cause them, and therefore in general betokens approaching rain, which comes when the particles are no longer able, on account of their size, to float in the air without sensibly falling. As before mentioned, this appearance is very common, and, in fact, we scarcely see a fragment of a cloud near the sun which does not give traces of color, depending on the average size of the particles of which it consists, and its angular distance from the sun.

A different form of corona is sometimes seen to surround the shadow of the spectator's head, when cast by the sun on a bank of fog—in this case it is sometimes called a *glory*. To this class belong the colors generally seen about the famous "Specter of the Brocken." See BROCKEN. The same appearances are very frequently seen round the shadow of the spectator when thrown on muddy water, or water carrying numerous small particles of sand. The optical explanation, founded mainly upon reflection and interference, is complete, but not suited to our pages.

So far the phenomena depend merely on the cloud or fog consisting of small particles; nothing has yet been said about the *shape* of the particles. Spherical *drops* of water produce rainbows (q.v.), and upon the vesicular form that moisture often assumes in the air, probably depend the blue of the sky and the gorgeous tints of sunrise and sunset. But halos (Gr.) and parhelia (Gr. false or mock suns) depend upon the presence in the air of innumerable *crystals* of ice, generally forming a light cirrus cloud. We cannot enter upon a complete explanation of these phenomena, but we shall give a general idea of their origin, referring the student who wishes a thorough knowledge of the subject to a memoir by Bravais (*Journal de l'Ecole Polytechnique*, xviii.), who

has himself repeatedly witnessed and carefully measured the various appearances in question.

The theory of halos was first roughly attempted by Huyghens; but although his explanations are in the main correct (at all events, as regards the very simplest of the appearances), they are based on the utterly inadmissible supposition, that the halo-producing clouds are formed of cylinders of water, each having an opaque, frozen nucleus. It will be seen that the results of this supposition agree with those of the correct one in a few cases only. Further progress was impossible until the crystalline form and the refractive index of ice were observed. Both of these observations are of great difficulty; but they have been carried out by Wollaston and others with considerable accuracy. After Huyghens, Mariotte, admitting the crystalline form of ice-particles, made some great steps in advance, and much of what he left unexplained was successfully supplied by Young, and after him by Kaemtz. The most complete and systematic explanation of the whole subject, however, is that of Bravais, already referred to. There, references are given to nearly all the accurately recorded observations of halos and parhelia—the great mass of which, of course, are due to arctic voyagers, especially Scoresby and Parry.

Water crystallizes in the form of regular hexagonal prisms, sometimes with plane ends perpendicular to the sides, sometimes with hexagonal pyramids as terminals. There is also an immense variety of much more complex forms; but upon the simpler and more common ones already mentioned, depend the ordinary cases of the phenomena we are about to describe. Now, if we consider any two non-parallel faces of one of the above crystals, it is clear that their combination must act as a prism, decomposing white light, which passes through them, into its constituent colors. Every such crystal, then, placed somewhere near the line joining the eye and sun, must in general send to the former some definitely colored ray from each effective pair of surfaces. The refractive index, however, of ice is such that no ray can pass through a prism of it whose angle is greater than about 99°.5; and we are therefore limited to pairs of faces whose inclination is not superior to this. The most important pairs are two *alternate* faces of the prism (fig. 1), where the inclination is 60°, and a face with a terminal plane, the angle being 90°.

Halo of 22° Radius.—We may now suppose prisms of ice, with refracting angles of 60°, to be distributed (with every possible position of their axes) nearly between the sun and the spectator, and it is evident that the appearances produced must be symmetrical with regard to the line joining the eye and sun, and must therefore consist of colored circles with the sun as center. To attain a more exact idea of the nature of these circles, suppose that we are dealing with light of one color only (say red). Now (see PRISM), if a beam of homogeneous light falls on a prism, it is refracted without separation. If the prism be turned gradually and uniformly about its axis, the refracted ray also turns, but *not* uniformly—at first rapidly, then slower, till it reaches a point at which it appears to be stationary for a little; then, on further turning the prism, the refracted ray *retrogrades*, at first slowly, then faster. There is therefore, a position of the prism, called that of *minimum deviation*, for which a slight alteration of the prism produces none in the direction of the refracted ray. Hence, as we have supposed prisms to be in the cloud in every possible position, those which are near the position of minimum deviation will conspire to refract light in the *same* direction, and their effects will be added. All the others will cause a *greater* deviation of the light, but few will conspire to send the light in any given direction. The appearance will therefore be a bright circle of red light surrounding the sun as center, its angular radius being the angle of minimum deviation, which, for a prism of ice of 60° angle, is about 21° 50′. Inside this circle there will be *no* light; outside, a feeble illumination only, becoming fainter as we go further from the sun. With orange light alone, there would be a somewhat larger circle, and so on. Hence, when white light falls on such a system, the effect is a circular halo, dark within, red on its inner edge, and with a mixture of more or less of the colors of the spectrum from inside outwards; so that, like the rainbow, which it much resembles, it differs from the ordinary spectrum (q.v.).

If we consider next the light *reflected* from the surfaces of the prisms, this will be *white*, and diffused with approximate uniformity all about the sun.

But the prisms with plane ends are not likely to be suspended in the air in all positions alike. If the prism be long and fine, it will have a tendency to fall end foremost, i.e., with its axis vertical, or (it may be) horizontal. If it be a flat hexagonal cake (a frequent form of snow), it will tend in the main to fall edgeways, so that, in addition to the halo which depends upon the ice-crystals having every possible position, there are distinct phenomena depending on an excess of the crystals having their axes vertical or horizontal. If we consider the sun as just rising or setting, it is plain that the right and left hand portions of the halo will be much more strongly marked than the others, as these parts are formed by crystals whose axes are vertical, and which form the majority. There are therefore to right and left of the sun, and on the halo, bright-colored images of the sun, which are called *parhelia*, or mock-suns.

It is perhaps a little more difficult to explain to the non-mathematical reader the formation of parhelia when the sun is not on the horizon, and to show why they then separate from the halo, and are formed externally to it, still, however, at the same

altitude as the sun. We may, however, make the attempt as follows: Suppose an indefinitely long vertical prism; rays of sunlight falling on this are separated, as before, but if the sun be not on the horizon, they no longer fall on the prism perpendicularly to its edge. Optics, however, shows us that for this oblique incidence also there is a position of minimum deviation, and therefore one angular distance from the sun at which the effects of a great number of prisms conspire, while far fewer conspire at any other angle. It is also shown that this minimum angle is greater as the incidence is more oblique. Also the inclination of the incident and refracted rays to the edge of a prism is always the same, however the ray may fall. Hence, as the edges of the prisms in question are vertical, the refracted rays appear to come from a point at the same altitude as the sun, and, by what was remarked above, further from the sun as the sun is higher. Hence the formation of the parhelia consisting of two colored images of the sun, at the same altitude as that body, and further beyond the halo as the sun is higher. Accurate measurements of their distance from the sun for different altitudes have been found to accord exactly with the results of calculation from the optical data. See PP (Ill.).

The light *reflected* from the surfaces of the vertical prisms, of course appears to come from an image of the sun in a vertical mirror, which, by optical laws, must have the same altitude as the sun itself. Such images then form a *white* horizontal small circle, passing through the sun and the parhelia. This is often observed, and helps to corroborate the above theory of the colored appearances. See the dotted line PSP (Ill.).

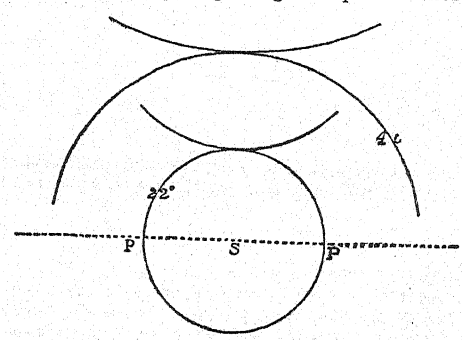
The light reflected from the horizontal terminals of these prisms must evidently produce a single white image of the sun, as much below the horizon as he is above it, and *vice versâ*. This appearance is also common enough.

Tangent Arcs to the Halo of 22°.—We have seen that in many cases the prisms of ice are so short as to be hexagonal plates. Their natural position in falling will be edge foremost, or there will be a multitude of snow-crystals whose axes are nearly horizontal, but of course arranged in all directions in the horizontal plane. Let us consider first all those whose axes are perpendicular to the line joining the spectator with the sun; these evidently (by an explanation similar to that of the parhelia given above) form parhelia *on* the halo at its upper and lower points. Another set, whose axes are also nearly horizontal and parallel, but slightly inclined to the former, will form parhelia to one or other side of the vertical plane passing through the sun, and on account of the obliquity of the incidence, the angle of deviation is increased, and these are *outside* the halo. They are further to the right or left of the sun's vertical plane, and further outside the halo as the crystals are more and more turned in their horizontal plane. The complete result is a brightly colored pair of arcs, which *touch* the halo at its upper and lower points, and lie completely outside. For certain elevations of the sun, these combine, forming a curve like an ellipse, whose center is the sun, whose larger axis is horizontal, and which touches the halo externally at its upper and lower points.

Halo of 46°.—This depends upon the right-angled prisms, formed by combining a terminal plane with one of the faces of the hexagonal prism; and with the single exception of a different refracting angle, and its consequent greater dimensions, its explanation and its appearance are the same as those of the halo of 22°.

Perhaps the most magnificent, both for brightness and separation of colors, of all the halos, is the colored arc which touches the halo of 46° at its upper point. This depends entirely upon the refraction of light through the upper edges of prisms having plane ends and whose axes are *vertical*. It is therefore due to the same cause as the parhelia of the halo of 22°; and it is a remarkable proof of the truth of this, that there is but one instance recorded in which the former appeared without the latter; and its absence was then easily accounted for by there being no cloud of ice-crystals near enough the sun to produce the parhelia. See Ill.

There are also sometimes seen brightly colored arcs touching one on each side the lower half of the halo of 46°. They are explained by the right angles of prisms whose axes are horizontal. Again, a parhelion being itself a source of light, sometimes very intense, may have *its* surrounding halos of 22°, etc. All phenomena of the latter class are termed *secondary*. They are in general, as might be expected, much fainter than the *primary* ones, but in favorable circumstances have been distinctly observed.



In addition to our very imperfect sketch of the results of the prisms of 60° and 90°, we might consider shortly those due to various combinations of planes of the hexagonal pyramid with each other, or with planes of the prism; but the phenomena depending on these, though easily enough predicted mathematically, are not well suited for verbal explanation.

We conclude with a rough geometrical sketch of a tolerably complete set of halos, observed by Bravais in Sweden in 1839. The marks on the sketch will be sufficient to inform the reader to which of the classes above mentioned the various portions belong.

HA'LOSCOPE, the name of a beautiful optical instrument invented by M. Bravais of France, for the exhibition of all the phenomena connected with halos, parhelia, etc. It consists of a vertical axis with a clock movement, for the purpose of giving it a rapid rotation; two glass prisms, one hollow to contain water; two opaque plates of glass to obscure one or two sides of the prisms, as required in different experiments; a quadrangular prism; and a small arm carrying a mirror: this last and the three prisms are all adapted for mounting on the axis. To imitate the parhelion, the vertical axis with the solid glass prism is set in rapid rotation in a darkened chamber, with a candle ten or twelve feet distant, but with the flame on the same plane as the rotating prism; two sides of the prism are to be obscured with the movable opaque slides of glass. The spectator then looks horizontally at the revolving instrument, and sees the parhelion circle. Different dispositions of the apparatus produce the allied phenomena.

HALOX'YLIN, the name of a new kind of explosive material or blasting-powder which has been invented in Styria by two brothers, and is described as incapable of spontaneous ignition, and as quite free from smoke and noxious gases. It is composed of non-resinous sawdust, charcoal, niter, and ferrocyanide of potassium, and is twice the bulk of gunpowder, but one-half more powerful. For blasting and mining purposes it is considered as preferable to gunpowder.

HALS, FRANS, 1584–1666; a Dutch painter second only to Rembrandt. At the time when the Dutch nation fought for independence and won it, Hals appears in the ranks of its military guilds. He was also a member of the chamber of rhetoric, and chairman of the painters' corporation at Haarlem. But irregularities of life marred his success, and in 1654 the forced sale of his pictures and furniture for debt brought him into absolute penury. At one time his rent and firing were paid by the municipality, which afterwards gave him an annuity of 200 florins. Hals's pictures illustrate the various strata of society into which his misfortune led him. His banquets or meetings of officers, of sharpshooters, and guildsmen are the most interesting of his works. But they are not more characteristic than his low-life pictures of itinerant players and singers. His portraits of gentlefolk are true and noble, but hardly so expressive as those of fish-wives and tavern heroes. His first master was Van Mander, the painter and historian. Of his numerous children, the best known is FRANS HALS, the younger, 1622–69. His pictures represent cottages and poultry, and the "Vanitas" at Berlin, a table laden with gold and silver dishes, cups, glasses, and books, is one of his finest works and deserving of a passing glance. Quite in another form, and with much of the freedom of the elder Hals, DIRK HALS, his brother, is a painter of festivals and ball-rooms. But Dirk had too much of the freedom and too little of the skill in drawing which characterized his brother. He remains second on his own ground to Palamedes. A fair specimen of his art is a "Lady playing a Harpsichord to a Young Girl and her Lover" in the Van der Hoop collection at Amsterdam. More characteristic, but not better, is a large company of gentlefolk rising from dinner, in the academy at Vienna.

HALSTEAD, a market-town of England, in the co. of Essex, is agreeably situated on both banks of the Colne, about 43 m. n.e. of London, and on the high-road from that city to Norwich. Its parish church, one of the finest in the county, is in the perpendicular style, with a decorated chancel. The chief educational institution is lady Mary Ramsey's grammar school, with a small endowment, founded in 1594. The manufactures are crape, silk, velvet, and paper; brick-making and straw-plaiting are also carried on. Pop. '71, 5,783.

HALSTEAD, MURAT, b. Ohio, 1829; a journalist, long the editor of the *Cincinnati Commercial*. He was educated at Farmers' college, College Hill, Ohio, and began to write for newspapers in Cincinnati at the age of 18. In 1851 he started a Sunday journal which lived two weeks. After roughing it on various papers, he got a place on the *Commercial* and slowly gained way until he became the responsible head. He is an active politician, though claiming to be independent of all parties.

HALTON, a co. in the province of Ontario, Canada, on lake Ontario, near the w. end; 362 sq.m.: pop. '71, 23,606. It is crossed by the Great Western, and the Grand Trunk railroads. Seat of justice, Milton.

HAL'YARDS, the smaller ropes and tackle used in hoisting sails or other portions of a ship's equipment. The signal halyards are running cords of the best white hemp, passing through a pulley in the truck at the mast-head, or gaff-point, and thence to the deck; the flags when attached to them are rolled up, and then hoisted and expanded to the wind by a jerk when the proper moment arrives.

HALYBURTON, THOMAS, a Scotch divine, b. 1674, d. 1712. He was the author of several works, including *Natural Religion insufficient, and Revealed necessary to Man's Happiness; The Great Concern of Salvation;* and *Ten Sermons preached before and after the Celebration of the Lord's Supper*. The works, especially the autobiographic memoir, of the "Holy Halyburton" were once very popular among the people of Scotland; and even at the present day they are greatly relished by persons of a serious disposition.

They were published, together with an essay on his "Life and Writings," by Robert Burns, D.D. (London, 1835).

HALYS, now known as Kizil Temak or Red river, the largest stream in Asia Minor. It rises in Pontus, and flows s.w. until it reaches the Mons Argœus; thence turning in a northerly direction it traverses Galatia as far as Gangra, the frontier town of Paphlagonia. Its course is then in a n.e. direction; and separating Galatia and Pontus from Paphlagonia, it discharges itself into the Euxine sea. Its mouth is 50 m. distant from Sinope. The Halys being the largest river of Asia Minor, a common division of the country was Asia cis-Halyn and Asia trans-Halyn. This river is 500 m. in length, but is not adapted for navigation, and in summer is so shallow as to be easily crossed by wading.

HAM, properly the hind part or angle of the knee; but usually applied to the cured thigh of the ox, sheep, or hog, more especially the last. Ham-curing, or, what is the same thing, bacon-curing, is performed in a variety of methods, each country or district having its own peculiar treatment; these, however, relate to minor points. The essential operations are as follows: The meat is first well rubbed with bay-salt, and either left on a bench that the brine may drain away, or covered up in a close vessel; after a few days it is rubbed again, this time with a mixture of salt and saltpeter, to which sugar is sometimes added, or with a mixture of salt and sugar alone. It is then consigned to the bench or tub for at least a week longer, after which it is generally ready for drying. *Wet salting* requires, on the whole, about three weeks; *dry salting,* a week longer. Mutton-hams should not be kept in pickle longer than 12 or 14 days. Some hams are merely hung up to dry without being smoked; others are removed to the smoking-house, which consists of two and sometimes three stories; the fire is kindled in the lowest, and the meat is hung up in the second and third stories, to which the smoke ascends through holes in the flooring. The fire is kept up with supplies of oak or beech chips, though in some districts, as in Westphalia, twigs of juniper, and in many parts of Great Britain peat, are used. Fir, larch, and such kinds of wood, on account of the unpleasant flavor they impart, are on no account to be used. The fire must be kept, night and day, in a smoldering state for about six weeks, at the end of which time, if the ham be not more than 5 or 6 in. deep, it is perfectly cured. As cold weather is preferable for this operation, it is chiefly carried on during winter. Many of the country-people in those parts of England where wood and peat are used for fuel, smoke hams by hanging them up inside large wide chimneys, a method common in Westmoreland. The curing of beef and mutton hams is carried on chiefly in the n. of England and Dumfriesshire in Scotland; that of pork-hams, on the other hand, forms a large and important item in the industry of various countries. Westphalia, in particular, is celebrated for the delicacy and flavor of its smoked hams. The efficiency of wood-smoke in preserving meat is due to the presence of pyroligneous acid. See PYROLIGNEOUS ACID and CREOSOTE.

HAM, a small t. and fortress of France, in the department of Somme, and situated on the river of that name, is distant 36 m. e.s.e. of Amiens, and about 70 m. n.n.e. of Paris. It is of ancient orgin; coins were struck here in the reign of Charles the bald (840–877). The seigniory or lordship of Ham, erected into a duchy in 1407, was held by the families of Courcy, Orleans, Luxembourg, and Vendome. The town is chiefly noteworthy on account of its old fortress or castle built by the constable de Saint Pol in 1470, and now used as a state prison. Its walls are 39 ft. thick, and its principal tower is 108 ft. in height, and the same in diameter. It is memorable as the place of confinement of Marbœuf, Moncey, and others; and subsequently of Polignac, Chantelauze, Peyronnet, and Guernon Ranville from 1831 to 1836; and of Louis Napoleon, the late emperor, from 1840 till 1846. After the *coup d'état* of Dec. 2, 1851, the republican generals Cavaignac, Lamoricière, Changarnier, and others were kept here for some time. Pop. '76, 3,122.

HAM, according to the writer of Genesis, was one of the three sons of Noah, and the brother of Shem and Japheth. The word is derived by Gesenius from the Heb. *Hamam,* "to be hot." His descendants are represented in the biblical narrative as peopling the southern regions of the earth, Arabia, the Persian gulf, Egypt, Ethopia, Libya, etc. Both he and his son Mizraim appear to have given their name to Egypt in particular. The Coptic or native name of Egypt is *Kem* or *Chem,* supposed to be the same word as Ham, and signifying both black and hot. In the hieroglyphic language, the name of Egypt is expressed by the two letters K. M. In the Rosetta inscription, the word occurs more than ten times, and is read by Champollion, *Chmè.* It is a curious and somewhat perplexing circumstance, that Ham should have received a name that must have been more appropriate to his descendants than to himself, for we are not told, and there is no reason to believe, that he was more sun-burned or blacker than his brothers. In explanation of this, it is customarily urged that the names of Noah and his sons had "prophetic significations"—an hypothesis which few feel to be altogether satisfactory.

HAMADAN', an important t. of Persia, in the province of Irak Ajemi, is agreeably situated at the northern base of mt. Elwund, 180 m. w.s.w. of Teheran, in lat. 34° 50′ n., and long. 48° 28′ east. Its streets are narrow and dirty; but the trade and manu-

factures carried on impart to it a lively and bustling air. It contains numerous caravansaries, excellent and well-furnished bazaars, gardens, baths, and mosques, as well as two notable tombs, one that of the famous Arabian philosopher and physician, Avicenna (q.v.), which draws numerous pilgrims to the town; and the other affirmed to be that of Mordecai and Esther. During four months in winter the cold here is excessive, and fuel with difficulty procured; throughout the rest of the year, however, the climate is delightful. Being the center of converging routes from Bagdad, Erivan, Teheran, and Ispahan, it is the seat of a large transit trade. Hamadan carries on extensive manufactures of leather; coarse carpets, woolen and cotton fabrics, are also made to some extent. Pop. variously estimated at from 10,000 to 40,000. Recent explorers have concluded, from historical evidence, and from the coins, inscriptions, and other remains found here, that Hamadan occupies the site of the Median Ecbatana. See ECBATANA.

HAM'ADRYADS. See NYMPHS.

HA'MAH (Gr. *Epiphania*, and the *Hamath* of the Bible), a city of Syria, 120 m. n. of Damascus. The town is built on both sides of the Orontes, which is here crossed by four bridges. A number of huge wheels, turned by the current, raise the water into aqueducts, which convey it to the houses and mosques of the town. The town is inclosed by walls, and the houses are built in the Damascus style of sun-dried bricks and wood. The principal structures are the governor's palace, many mosques, baths, bazaars, and the wheels and aqueducts already mentioned. There are manufactures of silk, cotton, and woolen fabrics, gold and silver thread. Hamah ranks among the oldest cities in the world. It was a noted place, and the capital of a little kingdom, when the Israelites came out of Egypt; and its name is mentioned in almost every passage in which reference is made to the northern border of the promised land. Pop. 30,000.

HAMAMELI'DEÆ. See WITCH HAZEL.

HAMAN, vizier and chief minister of Ahasuerus, king of Persia. After the failure of his attempt to exterminate the Jews in the kingdom, Haman was hanged on the gibbet which he had prepared for Mordecai. Jewish tradition declares Haman to have been descended from a chief family of the Amalekites, their ancient enemies: and it is said that many modern Jews apply the name Haman to any enemy, even Christians.

HAMANN, JOHANN GEORG, a very orginal thinker and author, who, on the title-page of some of his writings, called himself the "Magician of the North," was b. at Königsberg, in Prussia, Aug. 27, 1730. His early life was somewhat checkered: and a failure to acquit himself creditably in some business with which a merchant of Riga had intrusted him, induced him to abandon himself to dissipation, from which he was rescued by reading the Bible. He now devoted himself to the study of the ancient languages and of oriental literature, and made the acquaintance of many eminent authors. He died at Münster, June 21, 1788. As an author, Hamann was little esteemed by his contemporaries, as he opposed the tendencies of the age, and defended the dignity of revelation against the attacks of the rationalists, and was thus placed in opposition to the multitude of scholars. His language, besides, was figurative and symbolical in the highest degree, and frequently concealed, rather than revealed, the depth of his thinking. But his unmistakable genius, and the rich suggestiveness of his ideas, were appreciated highly by Herder, Goethe, Jacobi, Jean Paul, and other great men. The influence which he exercised upon Herder's views was very great. All his writings exhibit a deeply spiritual faith in the unseen and the eternal. Fragments of them were published by Cramer, under the title *Sibyllinische Blätter des Magus aus Norden* (Leip. 1819), and his *Sämmtliche Werke*, by F. Roth (7 vols. Berlin, 1821–25); an 8th vol., published by G. A. Wiener, Berlin, 1843, contains additions and explanations. His biography was published by E. H. Childemeister (*Hamanns Leben und Schriften*, 6 vols., 1857–73); and by Poel (2 vols., 1874–76).

HAMASAH, more correctly HAMASEH, the name of a famous Arabian anthology compiled by Habîb ibu Aus et-Tâi, surnamed Abû Temmân, which consists of 10 books, containing 884 poems on various subjects. These poems are fragmentary, and belong to the class of extempore utterance. The compiler himself was a distinguished poet in the style of his day (832 A.D.), who wandered through the provinces of the Moslem empire. He visited Khursâsân, then ruled by Abd-allâh, son of Tâhir, who rewarded him in various ways. On his return home, he was detained at Hamadan, and was for many months the guest of Abul-Wafâ, son of Selemeh. There he compiled a portion of the Hamasah, which remained a precious heirloom in the hands of the family of his host, until the decay of their fortunes, when a man named Dînawar took it to Ispahan and left in the care of the learned men there. The Hamasah is justly celebrated for its truth to nature, and while of little value as a historical record, forms a complete portraiture of the hardy and manful natures, and the lives of passion and storm which characterized the valiant stock who bore Islam abroad in a flood of new life over the worn-out civilizations of Persia, Egypt, and Byzantium.

HAMBACH, a village in Bavaria, 15 m. w. of Spires; pop. about 2,200. On May 27, 1832, there was held here a political meeting, the Hambacher Fest, which was attended by 30,000 persons, who combined to forward a movement for "the regeneration of Germany as a free country." A year afterwards there was a conflict at the anni-

versary celebration, and thereafter the meetings were forbidden. The village contains an old castle built in the middle ages. It was greatly damaged in the revolution of 1849.

HAMBA'TO, a t. of Ecuador, in South America, stands in lat. 1° 4′ s. and long. 78° 56′ w., at the n.e. base of Chimborazo, with Cotopaxi, about 25 m. distant, in front. Its elevation above the sea is 8,860 feet. At this altitude, wheat grows even under the equator. Though twice destroyed—by an eruption of Cotopaxi in 1698, and by an earthquake in 1796—Hambato has still a flourishing trade in grain, sugar, and cochineal, and contains about 12,000 inhabitants.

HAMBLEN, a co. in e. Tenn., between the French Broad and Holston rivers, intersected by the east Tennessee, Virginia and Georgia, and the Cincinnati, Cumberland Gap and Charleston railroads; 160 sq.m.; formed after the census of 1870. It is hilly or undulating, and the soil is fertile. Co. seat, Morristown.

HAM'BURG, The Republic of, is the largest of the free cities of Germany, and is situated in lat. 53° 32′ n., and long. 9° 58′ e., on the n. bank of the Elbe, at its junction with the small streams of the Alster and the Bille, about 75 m. from the German ocean. Hamburg was founded by Charlemagne in 804, but its commercial history began in the 13th c., when the emperor Frederick I. granted it the free navigation of the Elbe from the city to the sea, with the right of levying a toll on foreign shipping. These privileges were confirmed by his son, Otho IV., who raised Hamburg to the rank of a free city. In 1241 Hamburg joined with Lübeck in the formation of the Hanseatic league (q.v.), and from that time increased rapidly in wealth and commercial importance, augmenting its territory by the purchase of the township of Ritzebüttel, at the mouth of the Elbe (where the harbor of Cuxhaven is now situated), and several villages and islands in the vicinity of the town. Under the protection of the German emperors, Hamburg soon became powerful enough to defend itself and its commerce both by sea and land, and carried on war for a considerable period against the Dutch and the Danes, though with varying success. It early embraced the doctrines of the reformation, and in consequence of the vigorous administration of its affairs, never had an enemy within its walls during the stormy period of the thirty years' war. The frequently recurring disputes with Denmark ceased in 1768, when that power renounced all claim to any portion of the Hamburg territory. The prosperity of the city continued to increase until 1799, when a great commercial crisis occurred, followed in 1806 by its occupation by the French, which, with a few interruptions, lasted till 1814. During this period the town was strongly fortified, it being Napoleon's intention to make Hamburg the stronghold of his power in northern Germany. The sufferings of the citizens were very great, and their losses were estimated at £10,500,000. Their miseries culminated in the siege which the French under Davout sustained from the Russians in the winter of 1813–14, when 30,000 people were driven out of the town, many of whom perished of cold and hunger. In 1815 Hamburg joined the German confederation, and enjoyed a return of its former prosperity until the terrible fire of 1842, by which, within three days, one-third of the city was destroyed, and great loss of life and property took place. The fire was, however, not an unmixed evil, for advantage was taken of the opportunity to reconstruct that portion of the town, which by its broad, well-lighted, and well-drained streets, and fine and lofty houses, offers a striking contrast to the remaining part, much of which is devoted to wholesale business, and intersected by canals communicating with each other and with the river, by which goods are conveyed in lighters to and from the warehouses. The old ramparts have been converted into gardens and walks, and the beauty of the city is greatly increased by two large sheets of water formed by the Alster, and surrounded by good hotels and private houses, many of which in the suburb of Uhlenhorst, about two miles from Hamburg, are very charming.

There are several fine buildings, of which the exchange—where 4,000 merchants and others meet daily—and the picture gallery are the principal. Among the churches the principal are—St. Nicholas's, built from designs by sir Gilbert Scott, at a cost of £200,000, as a memorial of the fire of 1842, a very fine Gothic building, with one of the loftiest spires in Europe (483 ft. high); St. Michael's, built in the 18th c., in the Renaissance style, and also distinguished by a lofty spire (432 ft. high); and St. Catharine's, which is interesting from its age, being one of the few churches that escaped the fire.

Hamburg is the commercial emporium of northern Europe, and has recently been connected by bridges across the northern and southern branches of the Elbe with Harburg in Hanover, by which direct railway communication has been obtained with the free city of Bremen, and the route to Paris shortened by several hours. Great facilities have been given for the loading and discharging of steamers by the recent construction of extensive quays furnished with steam-cranes, warehouses, and communication by rail with the whole of the continent. Constant efforts are made to deepen the bed of the river, and under favorable circumstances vessels drawing 18 ft. can go up to the harbor at high tide. The number of sea-going ships that entered the port in 1876 was 4,991, with a burden of 2,180,451 tons, including 2,903 steamers of 1,721,048 tons, the total crews being over 70,000. The annual imports have trebled within the last 21 years. The goods received by sea, land, and river, on an average of the five years 1869

–73, amounted to 62,624,000 cwts., with a value of £78,680,000 per annum, of which 24,270,000 cwts., valued at £28,806,000, were from the United Kingdom. The average weight of the outward cargoes in the same period was about 12,000 cwts. In 1875 the total value of imports was £85,050,000.

Hamburg is one of the largest coffee-marts, and next to London, has the largest money-exchange transactions in Europe. It is also one of the principal emigration ports of Germany, above a quarter of a million persons having left during 1870–74, chiefly for the United States. There are several large joint-stock banks; marine insurance is also carried on extensively, the value of the ships and cargoes insured in 1872 having been £100,500,000. The sea-going ships belonging to Hamburg in 1877 were 439, of 196,011 tons, including 96 steamers, with a burden of 83,826 tons, chiefly belonging to five companies, and maintaining communication with North and South America and the East Indies. The manufactures of Hamburg are of little consequence, and are not estimated to exceed £2,500,000 in value per annum. The principal are cigar-making, spirit and sugar refining, brewing, meat-curing, engineering, and ship-building.

The charitable institutions of Hamburg are numerous and well endowed. The most important are the almshouses founded recently by Schroeder and Laeisz, and the Jewish hospital founded by the late Solomon Heine. There are a great many societies and asylums for the relief or reception of various classes, and the poor in general are well cared for. The general hospital has accommodation for 1800 patients, and there is a smaller hospital in connection with the sailors' home. The Rauhe haus, at Horn, near Hamburg, founded by Dr. Wichern in 1833, is worthy of notice as a very successful attempt to reform depraved and neglected children. Education is well attended to, and there are several large and excellent private schools, and a school of art, in addition to the Johanneum, a public grammar-school founded in 1528. There are two large public libraries, an observatory, botanical and zoological gardens, the latter being large and laid out with great taste; there are also two large and several small theaters, and a greater number of public gardens and places of amusement than in any other city of the same population.

The constitution of Hamburg is democratic. The executive power is vested in a senate of eighteen members chosen for life, with the assent of the municipal council, one-half of whom must have studied law; the legislative power being confined to the municipal council, consisting of 192 members, who are elected for six years, one-half retiring every three years. There is a very good tribunal of commerce, in addition to the ordinary courts of justice. Appeals can be carried in commercial cases to the supreme court of commerce at Leipsic, and in other cases to a court of appeal for the three Hanse towns at Lübeck. In 1866 Hamburg became a member of the north German confederation, and is now one of the states of the empire, sending three members to the imperial parliament at Berlin. The township of Bergedorf, 10 m. s.e. from Hamburg, formerly held jointly with Lübeck, became the sole property of Hamburg in 1868, and the whole territory covers an area of 156 English sq m.; pop. '75, 388,618, of whom about 14,000 are Jews and 7,800 Catholics. The city proper with its suburbs had in the same year a pop. of 348,447. As in the time of the Zollverein, Hamburg is still a free port; but the outlying portions of its territory are as formerly without the free-trade limit, and are subject to the same economical arrangements as the rest of the empire. Customs on goods passing beyond the boundaries of the free port are collected mainly at the railway stations of the city. Although Hamburg retains the management of its local affairs, the independent position formerly enjoyed by the republic ceased in 1866; the most noticeable consequence of this being the abolition of the Hamburg flag, and the withdrawal of its numerous consular and diplomatic representatives in foreign countries, in addition to compulsory service for three years in the army or navy by all young men liable to military duty. The estimated revenue of Hamburg in 1876 was £1,200,000.

HA'MELN, an interesting t., and formerly a fortress of Hanover, in the province of the same name, is beautifully situated on a commanding position on the Weser, at the confluence of the Hamel with that river, 25 m. s.w. of Hanover. It is surrounded by a wall, formerly surmounted by 20 towers, and defended by a fort, which, however, was blown up by the French in 1806. It is irregularly built, and is full of wooden houses in the old German style; has three churches, including the Münster, a fine old edifice, dating from 1127, and now falling into ruin; and a large educational institution built in 1827. The chain-bridge at Hameln, crossing the Weser, was completed in 1839, and is about 780 English ft. in length. Pop. '75, 9,520, chiefly employed in brewing; in the manufacture of paper, cement, woolen goods, and carpets; and in agriculture, salmon-fishing, and general trade. In the earliest times, Hameln belonged to the abbey of Fulda, and was a member of the Hanseatic confederation.

HAMERTON, PHILIP GILBERT, b. England, 1834. At the age of sixteen he made his appearance as an author, in *Rome in* 1849, and in the following year published a volume on heraldry. He had already devoted himself with considerable earnestness to the study of landscape-painting, and his passion for the art induced him to spend two years in Paris, which were devoted in this direction, and to explorations in French literature. In 1858 he commenced the periodical encampments on an island in loch Awe,

which continued during several years, and which he afterwards described in *A Painter's Camp in the Highlands*, and *Thoughts about Art*. In 1861 Mr. Hamerton went to reside in France, where he produced some important pictures, becoming also a contributor to the *Fine Arts Quarterly Review*, and to the *Fortnightly*. He also wrote art criticisms for the *Saturday Review*, and published several critical works on French art. In 1869 he founded the *Portfolio*, which soon achieved a high position in the esteem of cultivated persons, and became an authority in art matters, dignified by care in writing, and remarkable excellence in illustration. He has also written *The Unknown River; An Etcher's Voyage of Discovery; Chapter on Animals; The Sylvan Year;* the *Life of Turner; The Intellectual Life;* and *Round my House.*

HAMI, or KOMUL, a t. in central Asia, on the s. slope of the Thian-Shan mountains and the n. verge of the Gobi desert, 42° 48′ n., and 93° 28′ e., 3,150 ft. above tide. The town is first mentioned in Chinese history in the 1st c., under the name I-wu-lu, and said to be situated 1000 lis (a *li* is one third of a mile) n. of the fortress Yu-men-kaun, and to be the key to the western countries. This evidently referred to its advantageous position, lying as it did in a fertile tract, at the point of convergence of two main routes running n. and s. of the Thian-Shan, and connecting China with the west. It was taken by the Chinese in 73 A.D. from the Hiungnu (the ancient inhabitants of Mongolia), and made a military station. It next fell into the hands of the Uigurs, or eastern Turks, who made it one of their chief towns and held it for several centuries, and whose descendants are said to live there now. From the 7th to the 11th c., I-wu-lu is said to have borne the name of Igu, or I-chu, under the former of which names it is spoken of by the Chinese pilgrim Hwen-Thsang, who passed through it in the 7th century. The name Hami is first met with in the Chinese *Yuan-shi*, or *History of the Mongol Dynasty*, but the name more generally used there is Homi-li or Kom-li. Marco Polo, describing it apparently from hearsay, calls it Camul, and speaks of it as a fruitful place, inhabited by a Buddhist people of idolatrous and wanton habits. Owing to its commanding position on the principal route to the west, and its exceptional fertility, it has very frequently changed hands in the wars between China and her western neighbors. As regards the latter quality, it is even now said to yield rice, melons, oranges, and grapes of notable excellence, while, with respect to the former, baron F. Von Richthofen states that the route from Hsi-ngan-fu past Hami to Kuldja, is by far the best and indeed the only natural line for a railway from China to Hami. The Russian officer Sosnofski entered it in the autumn of 1875, after eight days' journey across the Gobi steppe lying to the south. He speaks of it as an important mart, whither wool from Turfan and Turkistan goods are brought to be exchanged for the products of central China. The Mohammedan population consists of immigrants from Jitishahr (or Kashgaria) Bokhara, and Samarcand, and descendants of the Uigurs. [*Encyc. Brit.*, 9th edition.]

HAMIL'CAR was a name borne by several distinguished Carthaginians, the most celebrated of whom were—1. The commander of the great Sicilian expedition, 480 B.C.; 2. One of the commanders of a Carthaginian army, defeated by Timoleon, the Corinthian general, at the Crimissus, 339 B.C.; 3. (surnamed Rhodanus) The ambassador to Alexander the great after the fall of Tyre; 4. The governor of Sicily, 317 B.C.; 5. The son of Gisco, who succeeded the preceding, and carried on military operations against the Syracusans and other states with great success, but was at length taken prisoner, and put to death; 6. A commander during the first Punic war, who was very successful against the Romans by land in Sicily, but was afterwards defeated in a sea-fight off Ecnomus, and was thereafter recalled to Africa to oppose Regulus.

But the greatest of all was Hamilcar, surnamed Barca or *Barak*, i.e., "lightning." While very young, he was appointed to the command of the Carthaginian forces in Sicily, in 247 B.C., at which time the Romans had possession of almost all the island. Hamilcar's first care was to discipline his infantry thoroughly; he then established himself on Mt. Ercte (now *Pellegrino*, near Palermo), and from this point made pillaging excursions in all directions, sending his privateers along the coast of Italy as far n. as Cumæ, thus obtaining abundant supplies for his troops. From this position the Romans endeavored to dislodge him, but in vain. After three years, he left Ercte; and established himself on Mt. Eryx, keeping up his communication with Drepanum, and the sea, where the same tactics were repeated on both sides, and with the same want of success on the part of the Romans. But the Carthaginian admiral having been totally defeated off the Aegates islands, 241 B.C., Hamilcar was compelled to abandon his fortress, and evacuate Sicily. While Hamilcar was engaged in Sicily, he had made large promises to his mercenary troops, which he was unable to perform; they revolted in consequence, and were joined by some of the African tribes. Hanno endeavored to suppress the revolt, but failed; Hamilcar was accordingly appointed to the command, and succeeded in utterly defeating the rebels, capturing all their towns, and putting to death their leaders. Hamilcar was next appointed commander-in-chief of the Carthagenian army, and was engaged for some time in wars with the neighboring tribes, which were abruptly ended by Hamilcar's entering upon his Spanish campaign in (probably) 236 B.C. His great aim was to found a new empire in Spain, from which, as his basis, he might assail the Romans. Such a kingdom he saw would increase the power and

wealth of his native country, and atone to her for the loss of Sicily and Sardinia. This his great purpose Hasdrubal and Hannibal endeavored to accomplish. He marched westward, while the fleet under his son-in-law, Hasdrubal, cruised along the coast; he then crossed over the strait of Gibraltar, and made war on the natives of Spain, in the course of which he penetrated to the very heart of the country, subdued many tribes and cities, and amassed immense wealth. He spent nine years in Spain, and at length, in 228 B.C., met his death on the field of battle while fighting against the Vettones. His military genius is considered scarcely inferior to that of his son Hannibal.

HAMILTON, a co. in n. Florida, n. and w. of Suwanee river, and intersected by the Allapaha, and crossed by the Atlantic and Gulf railroad; 400 sq.m.; pop. '70, 5,749—2,363 colored. The soil is level and sandy, and much of the surface is covered with forests. Cotton and corn are the chief products. Co. seat, Jasper.

HAMILTON, a co. in s. Illinois, crossed by the St. Louis and Southwestern railroad; 395 sq.m.; pop. '70, 13,014. The surface is mostly level, and the soil is fertile, producing corn, oats, wheat, etc. Co. seat, McLeansborough.

HAMILTON, a co. in central Indiana, on the w. fork of White river and Eagle and Cicero creeks, crossed by the Indianapolis, Peru and Chicago, and the Anderson, Lebanon and St. Louis railroads; 400 sq.m.; pop. '70, 20,882. Surface level; chief products: wheat, corn, hay, and pork. Co. seat, Noblesville.

HAMILTON, a co. in n. central Iowa, on Boone river, intersected by a section of the Illinois Central railroad; 576 sq.m.; pop. '75, 7,701. The surface is undulating prairie and woodland; chief productions: wheat, corn, oats, and hay. Co. seat, Webster City.

HAMILTON, a co. in w. Kansas on the Colorado border, intersected by Arkansas river and the Atchison, Topeka, and Santa Fé railroad; 975 sq.m.; formed after the census of 1870. The surface is undulating, and there is little timber. Co. seat, Syracuse.

HAMILTON, a co. in s.e. Nebraska on Platte river, drained by forks of the Big Blue; 500 sq.m.; pop. '76, 6,253. Surface mostly level; wheat, corn, oats, and hay are the chief products. Co. seat, Aurora.

HAMILTON, a co. in n.e. New York, mostly in the Adirondack wilderness at the headwaters of the Racket, Black, Hudson, and Sacondaga rivers; 1745 sq.m.; pop. '75, 3,482. The surface is rough, and there are a great number of small lakes and ponds. The soil is not well adapted to agriculture. Co. seat, Sageville.

HAMILTON, a co. in s.w. Ohio bordering on Indiana, crossed by the Miami, and bounded e. by Little Miami river; intersected by the various railroads that center at Cincinnati; 400 sq.m.; pop. '70, 260,370. The surface is moderately hilly, and the soil is very fertile. The main productions are corn, oats, hay, wheat, butter, pork, and wine. Co. seat, Cincinnati, the largest city in the state.

HAMILTON, a co. in e. Tennessee on the Georgia border, crossed by Tennessee river and by three or four railroads centering at Chattanooga; 575 sq.m.; pop. '70, 17,241—4,188 colored. The surface is mountainous, but the valleys are fertile, producing corn, wheat, etc. Coal and iron are found. Co. seat, Chattanooga.

HAMILTON, a co. in n. central Texas on Leon river; 850 sq.m.; pop. '70, 783—17 colored. Surface hilly, affording good pasturage. Cattle-raising is the main business. Co. seat, Hamilton.

HAMILTON, the seat of justice of White Pine co., Nev., 100 m. s. of Elko. It is at the foot of Treasure hill, in a barren region where water and timber are very scarce; pop. '70, 3,913. Its importance rises solely from the silver mines in the neighborhood.

HAMILTON, a t. in Madison co., N. Y., 29 m. s.w. of Utica on the Chenango canal and the Utica, Clinton, and Binghamton railroad; pop. '75, 370. The Madison university (Baptist) is in the town; also the Hamilton theological seminary, and the Hamilton female seminary.

HAMILTON, a city in Butler co., Ohio, on Miami river and canal, 20 m. n. of Cincinnati, with which it is connected by the Cincinnati, Hamilton, and Dayton railroad; pop. '70, 11,081. The city contains a number of important manufacturing establishments, such as iron foundries, flouring mills, etc. There are two parks, twelve churches, good schools, and a free library.

HAM'ILTON, a city of Canada in the province of Ontario, is situated at the w. end of lake Ontario, or rather of that detached section of it which, under the name of Burlington bay, is connected with the main body of the lake by the Burlington canal. Hamilton is 45 m. from the falls of Niagara, 38 from Toronto, and 378 from Montreal. It is situated in the very center of the finest grain-producing country in America, and it is also an important center of the chief Canada railways, the Great Western, the Hamilton and Toronto, and the Hamilton and Port Dover lines. The rapid increase of its population is remarkable. In 1841 it was about 3,500; in 1850, 10,312; in 1861, 19,096; and at the time of the last census, 1871, it amounted to 26,716. The Great Western railway and its branches have done much to advance its prosperity. The

manufacturing establishments of Hamilton are extensive; the principal are locomotive-works, foundries, and car-works. The city returns one member to the legislative assembly.

HAMILTON, a parliamentary and municipal borough, and market-town of Scotland, in the co. of Lanark, is beautifully situated on the left bank of the Clyde, in the center of a finely wooded district, about 11 m. s.e. of Glasgow, with which it is connected by railway. It has a straggling, but at the same time a pleasant rural appearance, many of the houses having a piece of garden-ground attached. The town contains some fine churches; numerous good schools—of which the academy and St. John's grammar school are the most important; the county-hall, a noticeable Grecian structure; a new town-hall; and extensive cavalry barracks. Many of the females are employed in *tambouring* for the sewed muslin manufacturers of Glasgow. Pop. '71, 11,299. Close to the town is Hamilton palace, the seat of the duke of Hamilton and Brandon, with the family mausoleum, in the midst of extensive pleasure-grounds bordered by the Clyde. The palace is a large and noble structure, and contains an excellent collection of paintings. On certain days the grounds are open to the public. Cadyow castle, and the remains of Cadyow forest, in which a herd of the famous aboriginal breed of wild cattle are kept, are in the vicinity.

HAMILTON, The Family of. This great historical family is known to be of English origin, but when or how it took root in Scotland has not been clearly ascertained. Some genealogists have sought to trace its lineage to Robert, surnamed Blanchmains, third earl of Leicester, who died in 1190. There is nothing improbable in the claim—the earl's second son was bishop of St. Andrews, he had other relations beyond the Tweed, and the cinquefoil on a bloody shield, which was the heraldic bearing of his house, seems from an early period to have been the heraldic bearing of the Scottish Hamiltons. But however probable such a descent may be, it wants proof. The name of the family, obviously territorial, was doubtless taken from some one of the many English manors called Hamilton, scattered through Buckinghamshire, Hampshire, Surrey, Lancashire, Rutlandshire, Yorkshire, and Leicestershire. In the 17th c. the Leicestershire Hamilton—a petty manor in the parish of Barkby, containing only a shepherd's cottage—was shown as the cradle of the house. Several persons of the name of Hamilton appear both in English and in Scottish records about the middle of the 13th c., and one of them seems to have held the Yorkshire manor of Hamilton, together with lands in the parish of Oxnam in Scotland. But the pedigree of the family cannot be carried beyond (1), "Walter Fitz-Gilbert (or Gilbertson) of Hamilton," who, in 1296, held lands in Lanarkshire, and swore fealty to king Edward I. of England as overlord of Scotland, and in 1314 kept the castle of Bothwell, on the Clyde, for the English. His early surrender of this strong fortress, and of the English knights and nobles who had fled to it from the field of Bannockburn, was rewarded by king Robert Bruce by grants of the lands and baronies of Cadyow and Machanshire in Clydesdale, Kinneil and Larbert in West Lothian, Kirkinner and Kirkowen in Galloway, and other lands forfeited by the Cumyns and other adherents of England. He attained the rank of knighthood, and married Mary, daughter of sir Adam of Gordon of Huntly, by whom he left two sons. The elder (2), "sir David Fitz-Walter Fitz-Gilbert," or, as he was sometimes more shortly called, "sir David Fitz-Walter," or "sir David of Hamilton," was taken prisoner by the English at the battle of Neville's Cross in 1346, founded a chantry in the cathedral of Glasgow in 1361, and appears among the barons in the Scottish parliaments of 1368, 1371, and 1373. His eldest son (3), "sir David of Hamilton of Cadyow," died before 1392, leaving by his wife, Janet of Keith, only daughter and heiress of sir William of Keith of Galston, five sons and a daughter. The eldest son (4), "sir John of Hamilton of Cadyow," married Janet, daughter of sir James of Douglas of Dalkeith, by whom he was the father of (5), "sir James of Hamilton of Cadyow," who, about 1422, married Janet, daughter of Alexander of Livingston of Callander, by whom he had (6) "sir James of Hamilton of Cadyow," and four other sons.

Lords Hamilton, Earls of Arran, Dukes of Chatelherault, Marquises of Hamilton, Dukes of Hamilton, Dukes of Brandon, etc.—Hitherto the family had been only knightly. It was ennobled in its sixth generation, in sir James of Hamilton of Cadyow, who, in 1445, was created lord Hamilton by a charter which erected his manor place of "the Orchard," in the barony of Cadyow, into his chief messuage, and gave it the name of Hamilton, which it still bears. It is to the praise of the first lord Hamilton that, in 1460, he founded a college in the university of Glasgow—the first college in Scotland founded by a layman. Allied both by marriage and by descent to the Douglases, he followed their banner in the beginning of their great struggle with the crown. But he forsook them at a critical moment in 1454, and his seasonable loyalty was rewarded by large grants of their forfeited lands, and, at a later period, when he must have been well advanced in years, by the hand of the princess Mary, the eldest daughter of king James II., and the widow or divorced wife of Thomas Boyd, the attainted earl of Arran. Lord Hamilton survived his marriage only five years, dying in 1478. His only son, James, second lord Hamilton, was, in 1503, made earl of Arran, and had a grant of that island, the dowry of his mother on her first marriage. After playing an important part in public affairs during the minority of king James V., he

died in 1529, being succeeded by the eldest son of his third wife (a niece of cardinal Beaton), James, third lord Hamilton, second earl of Arran. The death of king James V. in 1542 left only an infant of five days old between him and the throne. He was at once chosen regent of the kingdom and tutor to the young queen, and declared to be "second person in the realm"—a position which carried with it something of royal style. He signed or superscribed his name as "James G." or simply "James," and wrote himself "James, by the grace of God, earl of Arran and lord Hamilton, governor and prince of Scotland." He held his high offices till 1554, when he resigned them in favor of the queen-mother, Mary of Guise, receiving in return, from king Henry II. of France, a grant of the duchy of Chatelherault. His nearness to the throne, his great following, and large possessions, left him still a person of such mark that his eldest son, the earl of Arran, as he was called, was proposed at one time as the husband of queen Mary of Scotland, and at another time as the husband of queen Elizabeth of England. The career which opened with such high aspirations came to a sad and untimely end; the earl was afflicted with madness in 1562, and never recovered his reason, although he lived till 1609. His father, the first duke of Chatelherault, dying in 1575, his second son, lord John Hamilton, the lay-abbot or commendator of Arbroath, became virtual head of the house, and as such was, in 1599, created marquis of Hamilton. He died in 1604, being succeeded by his son James, the second marquis, who, in 1619, was created earl of Cambridge in England, and died in 1625. He was succeeded by his eldest son James, the third marquis; who led an army of 6,000 men to the support of king Gustavus Adolphus of Sweden in 1631–32, and a few years later acted a conspicuous part in the great contest between king Charles I. and the Scottish Covenanters. That king, in 1643, created him duke of Hamilton, with remainder to the heirs-female of his body, in the event of the death of himself and his brother without male issue. In 1648 he led a Scottish army into England for the king's relief, but was encountered and defeated by Cromwell at Preston, in Lancashire. He escaped from the field of battle, but soon afterwards was forced to surrender himself prisoner to the parliamentary forces. He was beheaded at Westminster in March, 1649, when he was succeeded by his brother William, who, in 1639, had been created earl of Lanark. He died in 1651 of the wounds which he had received at the battle of Worcester. The duchy of Hamilton, in terms of the patent of creation, now devolved on the daughter of the first duke, lady Anne, whose husband, lord William Douglas, earl of Selkirk, was, in 1660, created duke of Hamilton for life. He died in 1694. The duchess Anne, who survived till 1716, had, in 1698, resigned her titles in the king's hands in favor of her eldest son, James, earl of Arran, who was anew created duke of Hamilton with the precedency of 1643. In 1711 he was created duke of Brandon in England, but the house of lords refused him a seat or vote in parliament, on the ground that the crown was disabled by the act of union from granting a peerage of Great Britain to any person who was a peer of Scotland before the union. The duke was killed in a duel in Hyde park with lord Mohun in 1712. He was succeeded by his eldest son, James, who, dying in 1743, was succeeded by his eldest son, James, who, in 1752, married the famous beauty, Elizabeth Gunning, and died in 1758, being succeeded by his eldest son, James George, an infant of three years old. On the death of the duke of Douglas in 1761, the male representation of the "red" or Angus branch of the Douglases, with the titles of marquis of Douglas, earl of Angus, etc., devolved on the dukes of Hamilton, as descendants of the duchess Anne's husband, William, earl of Selkirk, third son of the first marquis of Douglas. Dying in 1769, in his 15th year, James George, seventh duke of Hamilton, was succeeded by his only brother, Douglas, who, in 1782, took his seat in parliament as duke of Brandon, the house of lords being now satisfied, after consultation with the twelve judges, that the act of union did not prohibit the crown from making a peer of Scotland a peer of Great Britain. Duke Douglas died without issue in 1799, when the titles and estates passed to his uncle, Archibald, the second son of James, the fifth duke. Duke Archibald, dying in 1819, was succeeded by his eldest son, Alexander, who, in 1810, married a daughter of Mr. Beckford, of Fonthill, and died in 1852, when he was succeeded by his only son, William Alexander Anthony Archibald, eleventh duke of Hamilton in the peerage of Scotland. He died in 1863, and was succeeded by William Alexander Louis Stephen Douglas Hamilton, the present duke, who was born in 1845.

Lords Paisley, Lords Abercorn, Earls of Abercorn, Lords Strabane, Viscounts Strabane, Viscounts Hamilton, Marquises of Abercorn, Duke of Abercorn, etc.—Lord Claud Hamilton, fourth son of the first duke of Chatelherault, was appointed commendator of the abbey of Paisley in 1553, created lord Paisley in 1587, and died in 1622. During his life, his eldest son, James, was made lord Abercorn in 1603, and earl of Abercorn in 1606. He had large grants of lands in Ulster; and dying in 1618, was succeeded by his eldest son, James, who in 1616 had been created lord Strabane in the Irish peerage. The sixth earl of Abercorn was, in 1701, created viscount Strabane in the peerage of Ireland. The eighth earl of Abercorn, then one of the 16 Scottish representative peers, was, in 1786, created viscount Hamilton, in the peerage of Great Britain; when the house of lords found, by a vote of 52 to 38, that a peer of Scotland who had been created a peer of Great Britain, could not sit in parliament as a representative of the peerage of Scotland. His nephew, the ninth earl of Abercorn, was, in 1790, created

marquis of Abercorn. It was ruled in his case, by the house of lords, in 1793, that a peer of Scotland, who had been created a peer of Great Britain, was entitled to vote in the election of the Scottish representative peers. On the death of the second duke of Hamilton in 1651, the second earl of Abercorn had claimed the male representation of the house of Hamilton; and in 1861, the second marquis and tenth earl of Abercorn (created duke of Abercorn in 1868), was served heir-male of the first duke of Chatelherault, in the sheriff court of chancery at Edinburgh, under protest by the duke of Hamilton, Brandon, and Chatelherault. The duke of Abercorn is one of three peers who hold peerages in Scotland, in Ireland, and in Great Britain; the others being the marquis of Hastings (earl of Loudoun in Scotland, lord Grey de Ruthyn, etc. in England, earl of Moira in Ireland, lord Rawdon in Great Britain); and the earl of Verulam (lord Forrester of Corstorphine in Scotland, viscount Grimstone in Ireland, lord Verulam in Great Britain). The house of Abercorn gave birth, in 1646, to Anthony Hamilton (q.v.), the author of the charming *Mémoires du Comte de Gramont.* He was the grandson of the first earl of Abercorn.

Earls of Selkirk.—Lord Charles Hamilton, third son of Anne, duchess of Hamilton, was, in 1688, on his father's resignation of the title, created earl of Selkirk, with the precedency of 1646. Dying childless in 1739, he was succeeded by his brother, lord John Hamilton, earl of Ruglen, who died without male issue in 1744, when the title of earl of Selkirk passed to his grand-nephew, Dunbar Hamilton of Baldoon (the grandson of lord Basil Hamilton, sixth son of Anne, duchess of Hamilton). He died in 1799, and was succeeded by his son Thomas, who, dying in 1820, was succeeded by his son Dunbar James, the present and sixth earl.

Earls of Orkney.—Lord George Hamilton, fifth son of Anne, duchess of Hamilton, was, in 1696, created earl of Orkney, with remainder to the heirs whatsoever of his body. Dying in 1737, he was succeeded by his eldest daughter, whose great-great-grandson, Thomas John Hamilton Fitzmaurice, is now fifth earl of Orkney.

Earls of Ruglen.—Lord John Hamilton, fourth son of Anne, duchess of Hamilton, was, in 1697, created earl of Ruglen, with remainder to the heirs whatsoever of his body. He succeeded to the title of earl of Selkirk on the death of his brother in 1739, and died in 1744, when the title of earl of Selkirk went to his grand-nephew, and the title of earl of Ruglen went to his eldest daughter, Anne, the widow of William, second earl of March. On her death in 1748, the earldom of Ruglen devolved on her son, William, earl of March, afterwards fourth duke of Queensberry; and on his death in 1810, the title of earl of Ruglen became extinct.

Earls of Haddington.—Sir Walter Fitz-Gilbert, the first ascertained ancestor of the house of Hamilton, had a brother, sir John of Hamilton of Roosaven, the progenitor of the family of Fingalton and Preston, which, in 1788, gave birth to sir William Hamilton, the famous scholar and philosopher; and of the family of Innerwick, which, in 1563, gave birth to sir Thomas Hamilton, nicknamed "Tam of the Cowgate," one of the ablest and most learned of Scottish lawyers. He was created lord Binning and Byres in 1613, and earl of Melrose (a title afterwards changed into Haddington) in 1619. His descendant, George Arden Baillie Hamilton, is now eleventh earl of Haddington.

Lords Bargeny.—Sir John Hamilton of Bargeny and Carriden, the illegitimate grandson of the first marquis of Hamilton, was, in 1639, created lord Bargeny. The title became dormant or extinct on the death of the fourth lord in 1736.

Lords Belhaven and Stentoun.—Sir James Hamilton of Biel married a natural daughter of the second marquis of Hamilton, and was, in 1647, created lord Belhaven and Stentoun, with remainder to his heirs-male whatever. He resigned the title in 1675, when he had a new patent creating him lord Belhaven and Stentoun for life, with remainder after his death to the husband of one of his granddaughters John Hamilton (son of Robert Hamilton of Barncluith, a judge of the court of session). This gentleman, who succeeded to the title and estates in 1679, distinguished himself by his wild but eloquent speeches against the union. He died in 1708, and was succeeded by his son John, who, being drowned in 1721, was succeeded by his son John, who died in 1764, and was succeeded by his brother James, who died in 1777. On his death, the great estates of the family passed to Mrs. Mary Hamilton-Nisbet, wife of Mr. Nisbet of Dirleton, and are now possessed by her granddaughter, lady Mary Bruce-Nisbet Hamilton. The titles were, in 1799, adjudged by the house of lords to William Hamilton of Wishaw (as descended from the house of Barncluith). His son, Robert Montgomery Hamilton, 7th lord Belhaven and Stentoun, was, in 1831, created lord Hamilton of Wishaw in the peerage of the United Kingdom. The title became dormant in 1868, but was adjudged in 1875 to James Hamilton, who thus became the ninth lord.

Viscounts Boyne.—Gustavus Hamilton, the grandson of lord Claud Hamilton, first lord Paisley, was, in 1715, created lord Hamilton of Stackallan, and, in 1717, viscount Boyne, in the peerage of Ireland. His descendant, Gustavus Frederick Russell Hamilton Russell, created in 1866 baron Brancepeth in the peerage of the United Kingdom, is now the 8th viscount.

Viscounts of Clanboy, Earls of Clanbrassil, etc.—James Hamilton, son of Hans Hamilton (a natural son of Archibald Hamilton of Raploch), vicar of Dunlop, in Ayrshire, settled in Ireland about 1587, and, in 1622, was created viscount of Clanboy.

His son James was created earl of Clanbrassil, and dying in 1659, was succeeded by his son Henry, on whose death, in 1675, the title became extinct. It was revived, nearly a century afterwards, in favor of his kinsman, James Hamilton of Tullimore (the grandson of Hans Hamilton, vicar of Dunlop), who in 1719 had been created viscount Limerick and lord Clanboy, and in 1756 was made earl of Clanbrassil in the peerage of Ireland. On the death of his son James in 1799, the titles became extinct. His estates went to his sister Anne, countess of Roden, whose grandson, Robert, earl of Roden, was, in 1821, created lord Clanbrassil in the peerage of the United Kingdom.

A *Briefe Account of the Family of Hamilton*, written by Dr. James Baillie of Carnbroe, during the first half of the 17th c., is preserved among the MSS. in the advocates' library at Edinburgh. A *History of the House of Hamilton*, written about sixty years afterwards by Hamilton of Wishaw, is not now known to be extant. *Memoirs of the Lives and Actions of James and William, Dukes of Hamilton and Chatelherault*, by Gilbert Burnet, afterwards bishop of Salisbury, were published in 1677. Mr. John Anderson, surgeon at Hamilton, published *Historical and Genealogical Memoirs of the House of Hamilton* in 1825, in 1 vol. 4to.

HAMILTON, ALEXANDER, a celebrated American statesman, b. Jan., 1757, in the West Indian island of Nevis, was the son of a Scotch merchant who had married a young French widow. His father soon failed in business, and Alexander, at the age of twelve, had to enter the counting-house of a rich American merchant, named Cruger. His extraordinary abilities, however, induced some of his friends to procure for him a better education than could be got at home. He was accordingly sent to a grammar-school at Elizabethtown, N. J.; and shortly afterwards entered Columbia college, New York. On the first appearance of disagreement between Great Britain and her colonies, Hamilton, still a schoolboy, and barely 18, wrote a series of papers in defense of the rights of the latter, which were at first taken for the production of the eminent statesman Jay, and which secured for the writer the notice and consideration of the popular leaders. On the outbreak of the war, he obtained a commission as captain of artillery, gained the confidence of Washington, was made his aid-de-camp in 1777, and acquired the greatest influence with him as his friend and adviser.

In 1780 he married a daughter of gen. Schuyler, who was a member of a very old family. On the termination of the war, he left the service with the rank of col., and, betaking himself to legal studies, soon became one of the most eminent lawyers in New York. In 1782 he was elected by the state of New York a representative at the continental congress; in 1786 he became a member of the New York legislature; and in 1787 he was appointed one of the delegates to the convention which met at Philadelphia, for the purpose of revising the articles of confederation. In conjunction with Madison, he had the most important share in drawing up the constitution afterwards adopted. He was a strong supporter of the federal, as opposed to the democratic party; and, along with Jay and Madison, defended the constitution against all attacks, by a series of letters in the *Daily Advertiser* of New York, afterwards collected and published under the title of *The Federalist*. Fifty-one out of the 85 numbers of which the work is composed were written by Hamilton. On the establishment of the new government in 1789, with Washington as president, Hamilton was appointed secretary of the treasury. The disorder of the public credit, and the deficiency of official accounts of the state treasure, rendered this office one of peculiar difficulty. In order to re-establish public credit, he carried, in spite of much opposition, a measure for the funding of the domestic debt, founded a national bank, rearranged the system of duties, and altogether showed himself one of the very greatest of American financiers. In 1795 he resigned his office, and resumed the practice of law in New York. When the war with France broke out in 1798, he was, according to the wish of Washington, made maj.gen. of the U. S. army; and, on the death of Washington, he succeeded to the chief command. When peace was restored, he returned to his civil duties, but became involved in a political quarrel with Aaron Burr. This difference unhappily culminated in a duel, in which Hamilton received a wound, of which he died the following day (July 12, 1804).

His writings, exclusive of *The Federalist*, have been published in 7 vols. by his son, John C. Hamilton.

HAMILTON, ALEXANDER (*ante*), ranks next to Washington among the statesmen of the period immediately following the war of the revolution. Jefferson transcended him neither in patriotism nor ability, but only in a clearer recognition and bolder assertion of popular rights as against established precedents. He played a part in the formation and early administration of the national government, without which it is at least doubtful whether it would have proved a success. If in some respects he was too conservative to suit the prevailing tendencies of the period, it is probable that for that very reason he was all the better qualified to guide the country in its transition from the ancient subserviency to the new independence. No man saw more clearly than himself the necessity of throwing off the yoke which Great Britain sought to impose upon the colonies, and few if any rendered more valuable service than he in the cause of independence; and his distrust of democracy as expounded and applied by Jefferson was no doubt shared by many of the lights of that day, including Washington himself. He espoused

the national cause with all the ardor of youthful patriotism, but when the time came to organize the new government he was fearful of too wide a departure from the ancient British models. He first attracted public notice by a remarkable political speech which he delivered when only 17 years of age, while he was a student in Columbia college, and in the next two years his writings in defense of the American cause displayed such ability that, in part at least, they were for a time attributed to John Jay. He enlisted as a soldier early in 1776, and was commissioned as a capt. of artillery. He soon attracted the notice of Washington, who at once recognized his extraordinary ability. He took part in the battle of White Plains, shared the retreat of the American forces through New Jersey, and fought at Trenton and Princeton. In March, 1777, he accepted the appointment of aid-de-camp on Washington's staff, and was of great assistance to him in the conduct of his large and very perplexing correspondence. The commander-in-chief indeed found in him, in spite of his youthfulness, an adviser on whose judgment in the most delicate and confidential matters he could safely rely. He took part in the battles of Brandywine and Germantown, and spent the winter with his chief at Valley Forge. He was present at the battle of Monmouth in 1778, and in the duel which followed between Laurens and Lee, acted as second of the former. When the French admiral D'Estaing arrived at Sandy Hook, Hamilton was sent to confer with him as to the part he was to take in the war. He was at West Point when Arnold's treachery was discovered, and earnestly advised Washington to yield to Andre's request to be shot and not hung. In 1780 he married a daughter of Philip Schuyler, and shortly afterwards, taking offense at what he thought an undeserved rebuke from Washington, tendered his resignation upon the spot, and refused to withdraw it, notwithstanding Washington made an apology. This occurrence, however, did not permanently interrupt their friendly relations. Hamilton was appointed commander of a New York battalion, and at the siege of Yorktown led a successful assault upon one of the British outworks. In 1782, having studied for a time with his father-in-law in Albany, he was admitted to the bar. He was shortly afterwards elected by the legislature of New York a delegate to the continental congress, in which capacity he took an active part in the settlement of important questions growing out of the war. He was one of the first to see the utter inadequacy of the articles of confederation as the framework of a national government. After the evacuation of New York by the British, he resigned his seat in congress and entered upon the practice of the law in that city. A large number of tory lawyers having been excluded from practice by act of the legislature, the young attorney found a wide field open before him, and at once achieved a marked success. He distinguished himself especially in certain suits arising out of the war, in which he took a position opposed to the public sentiment of the time, defending it with masterly ability and convincing the judgment of the court. From the first he displayed remarkable ability in handling questions of finance, and naturally enough took an active part in establishing the bank of New York. He was also one of the founders of the New York manumission society, sharing the hostility to slavery common among the most eminent patriots of his time. He also took an honorable part in the settlement of the differences between New York and Vermont, by which the latter became an independent state. His services in the convention of 1787, which framed the constitution of the United States, were of the highest value. He saw that the articles of confederation were a rope of sand, and that it was impossible to organize under them a government that would foster the instinct of nationality and command the respect of the world. His colleagues from New York were strongly opposed to him, and there was in the convention a morbid hostility to any plan tending to dwarf the powers of the states. By his efforts and those of other men likeminded, the tide was turned at length in favor of a national government that should rest upon the authority not of the states but of the people, and that should have power to defend itself alike against foreign and domestic foes. He offered a written sketch of such a government, differing in many respects from the one afterwards adopted, but illustrating the conservatism of the period. He was absent from the convention for a time, and, before he returned, his New York colleagues, finding the sentiment of the body turning in favor of a strong national government, resigned their seats in disgust, leaving him to represent the state alone. The constitution finally adopted did not wholly satisfy him, but when he saw that it was the best that could be obtained he supported it warmly; and no other man probably did so much as he to secure its ratification by the people. The series of 85 papers known under the title of *The Federalist*, of which 63 were written by him, no doubt served to commend the constitution to popular favor. These papers are still an authority upon many of the subjects therein discussed, and well deserve the place they hold in the political literature of the nation. Madison and Jay took part with Hamilton in their composition, though they were for the most part his own work. When Washington was chosen president, he selected Hamilton for secretary of the treasury—a post for which he was especially fitted, and in which his services were of the highest value to the country. He successfully resisted every scheme for repudiating the national debt, thus establishing the credit of the nation upon a stable foundation. Some of the measures he proposed met with a stubborn resistance, but he carried most of them successfully through. His funding system won the support of the moneyed and mercantile classes, as did also the national bank which he proposed, though the latter was

denounced in influential quarters as dangerous to popular liberty. Upon this and some other questions he encountered the opposition of Jefferson, between whom and himself a bitter controversy arose, which led to the retirement of the former from the cabinet. It deserves to be mentioned that the policy of so imposing duties on foreign imports as to afford protection to American manufactures, was advanced by Hamilton in a report which he presented at the first session of the second congress. Having succeeded in putting into operation the plans he had proposed, and finding his salary inadequate to his support, he resigned at the end of six years of service, Jan. 31, 1795, and resumed the practice of the law. He was still, however, a zealous supporter of Washington's administration, using his pen efficiently to sustain the measures it proposed. Washington, when about to prepare his farewell address to the country, sought and received Hamilton's advice, and it is by no means improbable, in view of the well-known relations of the men, that the latter assisted in the preparation of that celebrated paper. Hamilton did not escape imputations upon his integrity as secretary of the treasury. An attempt was made to prove that he had taken advantage of his official position for speculative purposes. He defended himself against these charges with entire success, but in doing so made an admission that left a stain of another sort upon his private character. Letters of his to a well-known speculator, implying confidential relations between them, were produced to confirm the current suspicion. Hamilton saw that he could not successfully defend himself without explaining the occasion of the letters in question, which he did in the frank confession that they had grown out of an intrigue with the wife of his correspondent. To save his character for official and political integrity, which had been falsely assailed, he acknowledged himself guilty of what he doubtless thought a more excusable offense. In consequence of the apprehensions of war with France, growing out of the ratification of Jay's treaty, measures were taken in 1798 to augment the army of the United States, and Washington was appointed commander-in-chief with the title of lieut.gen. He accepted the position on condition that he should not be called into the field, except in case of actual hostilities, and that Hamilton as maj.gen. should attend to the work of organizing the army. After the death of Washington in 1799, Hamilton was appointed commander-in-chief; but the war-cloud passed away, and he resumed the practice of the law in New York. He was, however, a conspicuous leader of the federal party, and took an active part in the political controversies of the time. Aaron Burr was a leader of the democratic party, and there sprang up between the two men a hostility which neither cared to disguise. Burr, embittered by his failure to be elected president, partly through Hamilton's influence, sought an election as governor of New York, hoping for success by the help of the federalists. But here again the influence of Hamilton barred his way, and he was defeated. In his exasperation he called upon Hamilton to disavow certain expressions derogatory to himself which he was assumed to have uttered. Failing to procure the desired disavowal, he challenged Hamilton. The latter felt himself compelled, for reasons of a public nature, to accept the challenge, and the duel was fought at Weehawken, July 11, 1804, and Hamilton at the first fire was mortally wounded, dying the next day. His death had the effect of rousing a public sentiment against dueling such as had not before existed in the northern states. Burr lived for 32 years after this, but with the stigma upon his character from which he never recovered. By multitudes he was denounced and shunned as a murderer. Hamilton's widow died in 1854 at the age of 97. His son, John C. Hamilton, wrote his life and compiled his works; the former (in 2 vols., 8vo.) in 1851. On Nov. 23, 1880, a granite statue of Hamilton was unveiled in Central park, New York, in the presence of members of the society of the Cincinnati, of gen. U. S. Grant, ex-gov. Bullock of Massachusetts, the mayor of the city, and of other distinguished personages, besides a large concourse of spectators. The statue is the work of Charles Conrads, and was presented to the city of New York by John C. Hamilton, a son of Alexander Hamilton. Talleyrand, when in New York, on seeing Hamilton at work late at night in his office, said of him: "I have seen one of the wonders of the world. I have seen a man laboring all night to support his family, who has made the fortune of a nation." And again: "I consider Napoleon, Fox, and Hamilton the three greatest men of our epoch, and without hesitation I award the first place to Hamilton."

HAMILTON, ANDREW, d. 1703 in New Jersey. He was of Scottish birth, and was governor of the colony of New Jersey from 1692 to 1701; afterwards lieut.gov. of Pennsylvania. He was the author of the earliest scheme for establishing post-offices in the colonies.

HAMILTON, ANTHONY, Count de, descended from the Scottish ducal family of that name, was b. in Ireland in the year 1646. After the execution of Charles I. he, with his parents, followed the royal family to France. On the accession of Charles II. in 1660, he returned to England, but was excluded from office for being a Catholic. James II. gave him a regiment of infantry in Ireland, and made him governor of Limerick; but after the abdication of that monarch, Hamilton returned to France, where he passed the rest of his life, and died at St. Germain-en-Laye in 1720. His writings are full of wit and talent, particularly his *Contes de Féerie* (3 vols., Paris, 1805). His *Mémoires de Grammont* is a lively and spirited production, exhibiting a free and faithful delineation

of the court of Charles II. It has been often translated into English. The last edition is that in *Bohn's Series*, with Scott's notes and illustrations. One of the best editions of his collective works is that published by Renouard (3 vols., Paris, 1812).

HAMILTON, CHARLES S., b. New York, 1822; graduated at West Point; served with credit in the Mexican war, and on the union side in the war of the rebellion, rising to the grade of maj.gen. of volunteers. He resigned two years before the close of the war, and engaged in manufacturing at Fond du Lac, Wis.

HAMILTON, ELIZABETH, 1758–1816; b. Ireland. She was brought up and educated in Scotland by an aunt. In her 15th year she made a tour in the Highlands with some friends and wrote a journal of it for her aunt's perusal, which was inserted, unknown to the author, in a provincial magazine. In 1785 she made her first voluntary contribution to the press in a letter to the *Lounger*. She produced her *Letters of a Hindu Rajah* in 1796, and soon after with her sister, Mrs. Blake, published the *Memoirs of Modern Philosophers*, a satire on the admirers of the French revolution. In 1801–2 the *Letters on Education* appeared, her most valuable though not her most popular work. After traveling through Wales and Scotland for nearly two years, the sisters took up their abode in 1803 in Edinburgh. In 1804 Mrs. Hamilton, as she then preferred to be called, published her *Life of Agrippina, wife of Germanicus;* and in the same year she received a pension from government. About this time she took charge of a widowed Scotch nobleman's family; and to his eldest daughter were addressed *Letters on the Moral and Religious Principle*, published in 1806. Her next publication of importance, *Cottagers of the Glenburnie*, appeared in 1808. This work, to which the author owes most of her fame, is an admirable description of the failings of the Scotch peasantry in their home life. Her subsequent works were a supplement to her *Letters on Education*, under the name of *Popular Essays on the Elementary Principles of the Human Mind, and Hints addressed to the Patrons and Directors of the Public Schools.*

HAMILTON, Lady EMMA LYON, 1764–1815; wife of sir William Hamilton, the antiquary. She was the natural child of a servant girl; was employed as nurse, then as sales clerk, then as chambermaid to a titled lady, then as waitress in a tavern, and then for some years she was the mistress of a sea-captain. The captain resigned her to a friend, who deserted her, and she was engaged to represent the figure of the goddess of Hygeia in a quack doctor's show. Her next affinity was Charles Greville, of an old family in Warwickshire; to whom she bore three children. He wanted to marry her but his uncle (sir William Hamilton) opposed the union. But as soon as the uncle saw her he fell desperately in love himself. The nephew then sold her to his uncle, the latter agreeing to pay the former's debts. Not long after sir William married her, and as his wife presented her at the court of Naples. Here she formed a *liaison* with lord Nelson with her husband's connivance. She was concerned in the political conflicts of the time, and obtained possession of a letter written by Charles IV. of Spain to his brother the king of Naples, in which he accused the English of various misdeeds. This letter she sent to London, which act brought on a war in which the English severely punished the Spaniards. Returning to England, the adventuress found a very cold reception, chiefly on account of her relations with Nelson, who had resigned to be constantly at her feet. She had one daughter to whom she gave the name Horatia Nelson. When both husband and lover died she was left poor, and not long after went to France, where she died in want. Her daughter married a clergyman. Lady Hamilton was a remarkably beautiful woman, and so captivated the painter, Romney, that he is said to have represented her in twenty-three of his works.

HAMILTON, GAVIN, 1730–97. At an early age he was sent to Rome, where he studied painting under Massuchi. His best pieces are designed from the *Iliad*, such as "Achilles beside the dead body of Patroclus," "Andromache bewailing the Death of Hector," and "Helen and Paris." Hamilton, however, has rendered greater service to art by his discoveries of precious fragments of ancient monuments than by his direct contributions to it. The latter part of his life was devoted to researches of this kind, which he prosecuted in various parts of the Roman states, but especially at Civita Vecchia, Velletri, Ostia, and above all at Hadrian's villa, at Tivoli. The statues, busts, and bas-reliefs found by him form the most interesting portion of the museo Clementino, after the treasures of the Belvidere. Many collections in England, Germany, and Russia, owe their chief ornaments to his labors. To one of the best of these—the Townley gallery—Hamilton contributed a large number of valuable marbles, a list of which is given in the *Townley Gallery*, published by the society for the diffusion of useful knowledge.

HAMILTON, JAMES, 1786–1857; b. S. C.; educated to the law; served in the army during the war of 1812 as a maj. of militia, but afterwards began the practice of his profession. While mayor of Charleston in 1822 he discovered and frustrated a plan for an insurrection of slaves. He was in the South Carolina legislature, and in congress, where he was John Randolph's second in the duel with Henry Clay. In the nullification period, 1830–32, he was governor of South Carolina, and strongly urged the adoption of the nullification ordinance. At a later era he was minister from Texas (before annexation) to England and France, both of which nations acknowledged the independence of the "lone star" republic. He lost his life in a steamboat collision.

HAMILTON, PATRICK, one of the most prominent precursors of the Scottish reformation, was a younger son of sir Patrick Hamilton of Kincavel and Stanehouse, and of Catherine Stewart, daughter of Alexander, duke of Albany, second son of king James II., and, in all probability, was b. in the year 1504, and in the city of Glasgow. He was educated at the university of Paris, where he took his degree in 1520, after which he proceeded to Louvain, where he remained for some time, and thence removed to Basel in 1521.

When Hamilton settled in St. Andrews in 1523, he brought with him the new tastes and interests which he had learned to cherish. For some time, his opinions attracted no particular attention. He quietly pursued his theological studies, and did not as yet venture to put himself forward as a reformer. He had been appointed in his boyhood abbot of Ferne, and although he never went into residence or lived as a monk, he was content to enjoy the advantages and dignity of his ecclesiastical position. But gradually his convictions matured. From agreeing with Erasmus, he came to agree with Luther; and about 1526 he appears to have announced his new views in such a manner as to draw the notice of the archbishop Beaton. Early in 1527 Beaton made "inquisition" into the grounds of the rumor against him, and found that he was "infamed with being disputing, holding and maintaining diverse heresies of Martin Luther and his followers, repugnant to the faith," and thereupon proceeded to "desire" him to be formally summoned and put to trial. In the following year he carried out his summons by a professed trial and conviction, declaring him to be worthy of death. In the meantime Hamilton had fled to Germany, where he became familiar with Luther and Melancthon. The Protestant education of Hamilton was in this manner very complete. Such a man, while he became a reformer, became one in no sectarian sense. His doctrinal opinions were characterized by something of the cosmopolitan breadth which marked his training, and by a scriptural simplicity befitting his honest and persevering spirit of inquiry. The substance of his doctrines has been fortunately preserved by his own pen under the title of *Patrick's Places;* and simplicity, combined with comprehension and aphoristic brevity, may be said to be the chief characteristics of them.

After a residence of six months, Hamilton returned to his native country. He repaired to the family mansion at Kincavel, and there, in the neighborhood of Linlithgow, openly preached the gospel. What is more remarkable, he is supposed, during this brief period of quiet and retirement at Kincavel, to have married. It is somewhat strange that, following such an event, he should have been induced to quit his retirement, where he was in comparative safety, and proceed to St. Andrews. Beaton, however, contrived to allure him within his grasp. He "travailed with the said Mr. Patrick," Knox says, "that he got him to St. Andrews." Hopes seem to have been held out of some good being effected by a conference with him as to the state of the church and its need of reformation; for "reformation" of some kind was a common talk at this time in the church, and many plans were considered, and some attempted for carrying it out.

Hamilton arrived at St. Andrews in Jan., 1528, and took up his abode in a lodging provided for him by the archbishop. A conference was held, in which his opponents showed a conciliatory spirit, and even to some extent expressed concurrence in his views. No advantage appears to have been taken of his former summons and condemnation. He was allowed openly, for some time, to promulgate his sentiments in the city and university. With all visitors he freely conversed, and among these, with Alexander Alane or Alesius, at this time one of the canons in the priory, and with Alexander Campbell, one of the Dominican friars, "a young man of good wit and learning," suborned, it is alleged, by Beaton, to entrap him into avowals of heretical opinion. After a month or so (*plus minus mensem*, says Alesius), he was summoned to answer before Beaton to a charge of heresy. The trial took place on the last day of Feb. and the result, in spite of his luminous and unanswerable argument was, that Hamilton was condemned for divers heresies and "detestable opinions"—deprived of all dignities and benefices in the church, and delivered over to the secular power to be punished. The sentence was carried out without delay. The warrant of the secular power must have been already secured, for on the very same day on the morning of which he was tried, Hamilton was consigned to the stake in the front of the gate of St. Salvador's college. He died as he had lived, a humble, earnest, heroic man. His character, if it scarcely attained to greatness in his brief lifetime, yet shines with a chastened and magnanimous luster through the fires of his early martyrdom. His death probably did more to extend the reformation in Scotland than even his life could have done. The "reik of Mr. Patrick Hamilton," said one of Beaton's own retainers, "has infected as many as it did blow upon."

HAMILTON, ROBERT, 1743–1829; a Scottish writer on finance, educated at the university of Edinburgh. Although desirous of following a literary life, he entered a banking-house in order to acquire a practical knowledge of business. In 1769 he gave up business pursuits and accepted the rectorship of Perth academy. In 1779 he was presented to the chair of natural philosophy at Aberdeen university. For many years, however, by private arrangement with his colleague, prof. Copland, Hamilton taught the class of mathematics. In 1817 he was presented to the latter chair. For some years before his death he had retired from the active business of his chair, and quitted his

privacy only at rare intervals, to take part in important affairs concerning the college. Hamilton's most important work is the *Essay on the National Debt*, which appeared in 1813. A posthumous volume published in 1830, *The Progress of Society*, is also of great ability, treatment of economical principles by tracing their natural origin and position in the development of social life.

HAMILTON, SCHUYLER, b. New York, 1822; grandson of Alexander; graduated at West Point; served (and was twice wounded) in the war with Mexico; resigned from the regular army in 1856; went into the union army as a private in 1861, and in 1862 was maj.gen. of volunteers; was prominent in several engagements. He has published a *History of the National Flag*.

HAMILTON, WILLIAM, 1704–54; a Scottish poet, author of *The Braes of Yarrow;* probably studied at the university of Edinburgh; an associate in years after with Allan Ramsay and Henry Home. As early as 1724 he contributed to Ramsay's *Tea Table Miscellany*. In 1745 Hamilton joined the cause of prince Charles, and, though it is doubtful whether he actually bore arms, he certainly celebrated the battle of Prestonpans in an ode beginning—*As over Gladsmuir's bloodstained field*. After the disaster of Culloden he lurked for several months in the highlands, and at length escaped to France; but in 1749 the influence of his friends at home procured him permission to return to Scotland, and in the following year he obtained possession of the family estate at Bangour.

HAMILTON, Sir WILLIAM, grandson of William, third duke of Hamilton, b. in Scotland in 1730, was, in 1764, appointed English ambassador to the court of Naples. During his residence there, he took an active part in the excavation of the ruins of Herculaneum and Pompeii, and collected a rare assortment of art-relics, consisting chiefly of Greek and Etruscan antiquities, which was afterwards purchased for the British museum. He was recalled to England in 1800; but while on his way home the vessel in which he sailed was unfortunately wrecked, and a great part of his collection of antiques lost. Drawings of these had, however, been preserved, which were afterwards published in his *Antiquitiés Etrusques, Grecques, et Romaines, tirées du Cabinet de M. Hamilton* (4 vols. Naples, 1766). He also published *Observations on Mount Vesuvius, Mount Etna*, etc. (Lond. 1772); *Campi Phlegraei* (Naples, 1776–77), etc.; besides some papers in the *Philosophical Transactions* (Lond. 1767–1795). Hamilton's claim on the British government for special services was disallowed, and he died at London in comparative poverty, April 6, 1803. The wife of Hamilton was the notorious lady Hamilton, whose name figures unpleasantly in the biography of lord Nelson. She died at Calais in 1816, and her memoirs have been published.

HAMILTON, Sir WILLIAM, of Preston, bart., the most learned and scientific philosopher of the Scottish school, was b. Mar. 8, 1788, at Glasgow, where his father, Dr. William Hamilton, and his grandfather, Dr. Thomas Hamilton, held in succession the chairs of anatomy and botany. Though the Hamiltons of Preston (Haddingtonshire), who were raised to a baronetcy in 1673, had not assumed their title since the death of sir William Hamilton in Nov., 1688, when his brother and heir, sir Robert, the covenanter, refused to take the oath of allegiance, the philosopher made good his claim to represent them, and therefore to be descended from the leader of the covenanters at Drumclog and Bothwell Bridge. After gaining high distinction, especially in the philosophical classes, at Glasgow, he went in 1809 to Balliol college, Oxford, as a Snell exhibitioner, and there, notwithstanding the unusually high standard of scholarship at the time, the position which he took never had, nor has been surpassed. It was at this time, moreover, that he laid the basis of his vast erudition in mediæval and modern, as well as in ancient literature, and he himself felt that his residence in Balliol was the most important period of his life in determining the drift of his subsequent speculations and studies (see *Discussions*, 2d ed., p. 750, *note*). He left Oxford in 1812, and entered the Scotch bar in 1813, but he seems never to have had any practice in his profession except what became incumbent on him afterwards, on being appointed crown-solicitor of the court of teinds. In 1820, on the death of Dr. Brown, he was an unsuccessful competitor for the chair of moral philosophy in Edinburgh. In the following year, however, Hamilton was appointed to the professorship of history by its patrons, the faculty of advocates.

Hamilton had now reached his 30th year, without giving to the world any indication of those speculations which he had been silently and slowly maturing. But in 1829 there appeared in the *Edinburgh Review* a critique of Cousin's *Cours de Philosophie* of the previous year, in which was developed that philosopher's doctrine of the infinite. The critique immediately excited admiration not only among the few in our island who comprehended it, but much more extensively on the continent, Cousin himself being among the first to acknowledge that his reviewer at once understood thoroughly the theory which he opposed, and combated it with a speculative power, with a knowledge of philosophical systems, and a command of philosophical expression, which he had not expected to find existing in Britain. For some years after this, Hamilton was a regular contributor to the *Edinburgh Review*. Besides other philosophical articles, two of which, on the "Philosophy of Perception," and on "Recent Publications in Logical Science," are especially celebrated, he contributed several on education and university reform.

Many of these contributions, besides being republished in Mr. Crosse's *Selections from the Edinburgh Review*, were translated into German, French, and Italian, the French collection, *Fragments de Philosophie*, being especially valuable for the introduction, appendix, and notes of its editor, M. Peisse. In 1852 they were all edited by Hamilton himself, with large notes and appendices, under the title of *Discussions in Philosophy and Literature, Education, and University Reform*. In 1836, after a severe contest, Hamilton was elected to the chair of logic and metaphysics in Edinburgh. During his first session, he delivered a course of lectures on metaphysics, which was followed in the succeeding session by a course on logic; and these two courses he continued to read on each alternate year till the close of his life. His influence soon began to show itself in the university among the young men who were attracted thither from different parts of Scotland, and other countries, in many cases chiefly for the sake of hearing Hamilton; and many of his pupils now rising to distinction in various professions, trace to the impulses which issued from his class the most valuable element of their education. Extensive notes of his lectures were taken by his students, and numerous copies of them, transcribed from shorthand reports, were in circulation during the later years of his life. Since his death they have been published under the editorship of professors Mansel and Veitch (*Sir William Hamilton's Lectures*, 4 vols. 1859–61.) These lectures, which were mostly written during the currency of the sessions in which they were first delivered, want the exactness of thought and expression which render the works revised by himself for publication models of philosophical composition; but this may be said to convey higher value to them as introductory works. Still it is to be regretted that the materials embodied in these volumes were never, as was intended, wrought into another work which Hamilton had already planned at the time of his appointment. This was his edition of the works of Reid, with notes and supplementary dissertations. It is perhaps impossible to adduce any writings which have received the same amount of editorial care. The general aim of Hamilton's whole philosophy is, in fact, but the special aim of this edition of Reid. His conviction was, that the philosophy of common sense represents the highest reaches of human speculation, and he sought, accordingly, in his annotations of Reid's writings, as in his independent works, to point out the relation of the Scottish philosophy to the systems of other countries, as well as to translate it into a more scientific expression, that he might bring into clearer view at once its true character and the real basis on which it rests. In this, therefore, more than in any of his other works, he betrays his fondness for eliciting his own theories from the hints of previous thinkers; his peculiar doctrines of perception, of the conditioned, of mental reproduction, etc., are traced to the writings of Aristotle. Valuable, however, as this work is, its latest edition contains references to numerous dissertations beyond that, in the middle of which it abruptly stops. This is undoubtedly to be attributed to the decay of Hamilton's health. By the paralysis of his whole right side, though his mind continued unimpaired, his power of work was seriously curtailed during the later years of his life. He was, however, generally able, with an assistant, to perform the duties of his class till the close of session 1855–56, when his health suddenly became worse, and he died May 6. See his life by prof. Veitch (1869).

The time has scarcely come for estimating the position of Hamilton in the history of philosophy. Though his system professes to be merely an explication of the Scottish philosophy, he seems to be already creating an independent school, and, indeed, it may be questioned whether all his exegetical skill has vindicated the position claimed for Reid, whether, therefore, it would not have been better for Hamilton had he struck into a separate path. For while his philosophy is distinguished in general from previous Scottish speculations by its more rigorously systematic character, it ventures, as in his doctrine of the conditioned, into realms of thought, whose existence had been scarcely surmised by any of his countrymen. This doctrine, which limits positive thought to the conditioned sphere between the contradictory poles of the infinite and the absolute, has attracted more attention than any of his other doctrines, especially since the publication of Mr. Mansel's *Bampton Lectures* in 1858; and though Hamilton's discussion is confined to the metaphysical aspects of the question, and is perhaps incompatible with a consideration of the ethical ideas which must be embraced in our conception of the Infinite Being, it is likely for some time to gather round it the higher efforts of British speculation. Hamilton is also worthy of being distinguished by his important contributions to logic. These may be reduced to the two principles (1) of distinguishing reasoning in the quantity of extension from reasoning in that of comprehension, and (2) of stating explicitly what is thought implicitly; from the former of which issues his twofold determination of major, minor and middle terms, as of major and minor premises; from the latter the quantification of the predicate, the reduction of the modes of conversion to one, and his numerous simplifications in the laws of syllogism.

HAMILTON, Sir WILLIAM, PHILOSOPHY OF, may, within the narrow limits of this article, be most clearly exhibited by a brief outline of his *Lectures on Metaphysics*, given as far as possible in his own language. Philosophy is the study of the nature of things. Its paramount object of consideration is the mind, and, in its stricter meaning, it is

limited to the knowledge of mind and of objects relating to that. It has regard to three points: the facts to be observed; the laws which regulate them; and the true results which are to be drawn from them. There are three great classes of mental facts: those of the cognitive faculties, those of the feelings, and those of the will and desire. The laws which regulate the first constitute logic; those which guide the second are called æsthetics; and those which control the third are known as moral and political science. Among the results to be drawn from these facts are proofs of the being of God and of the immortality of man. Psychology is the science conversant with the facts of the mind. All human knowledge, and, therefore, all philosophy are of the relative or conditioned as opposed to the absolute. This is true of matter, certain qualities of which are known; itself, or, as we commonly say, its substance, is unknown. It is true of mind; certain mental states of knowing, feeling, willing, and desiring are known, but the mind itself is unknown. It is true of existence; certain manifestations of it we know, but of absolute existence we know nothing. Our knowledge of existence is limited by our faculties. Nothing exists *for us* except as it is known to us; and nothing is known to us except certain properties or modes of existence which are analogous to our faculties. Yet, as we are warranted to assert the existence only of what we know, so we are not warranted to deny the existence of what we do not know. The term *mind*, in the rigid employment of it, denotes the self-knowing principle alone. We cannot conceive of mind as existing without consciousness. The term conscious subject is sometimes used as a comprehensive definition of the mind itself or the thinking principle. The great problem of philosophy is to analyze the contents of our cognitions or acts of knowledge; to distinguish what elements are contributed by the mind and what by the object of our knowledge. The general conditions of consciousness are that it is an actual knowledge; is immediate and discriminating; includes judgment; and requires memory. It is co-extensive also with our knowledge. Consciousness is the source of philosophy of mind. The possibility of philosophy implies the veracity of consciousness which as a criterion is naturally clear and unerring. In order to secure the full value of it, three laws for its government must be observed. 1. The law of parsimony. The facts of consciousness adduced must be primary, universal, necessary, and given on the ground of belief only. 2. The law of integrity. The whole facts of consciousness must be taken without hesitation or reserve. 3. The law of harmony. Nothing but the facts of consciousness must be admitted. When all these laws are observed the absolute and universal veracity of consciousness must be maintained. Activity and passivity are always conjoined in manifestations of the mind. The mind is never directly conscious of passivity; is never wholly inactive; and we are never wholly unconscious of its activity. The mind may be unconsciously modified. Our whole knowledge is made up of the unknown and incognizable. There are three principal facts of consciousness: 1. Of self-existence; 2. Of individuality; 3. Of personal identity. There are various cognitive faculties. 1. The presentative, including perception and self-consciousness; 2. The conservative, or memory proper; 3. The reproductive, that is the faculty of recovering the absent thought from unconsciousness; 4. The representative, that is the imagination; 5. The elaborative, that is comparison; consisting of analysis and synthesis, and leading to generalization or conception, to judgment, which is the direct comparison of two things or notions, and to reasoning, which is the comparison of two through a third. This last is thought strictly so called, corresponding to *dianoia*, of the Greek philosophy; *discursus* of the Latin, and *verstand* of the German. Its laws are the object of logic; 6. The regulative faculty, which is reason or common sense. There are cognitions in the mind which are not contingent but necessary, and presupposed by thought as its fundamental condition. They are not derived from experience but are native to the mind, and are the laws by which it is governed. They are similar in character, and are to be collected into a class. To the power possessed by the mind of manifesting these the name regulative faculty is given. It corresponds in some measure with the *nous* of Aristotle's philosophy, with the *vernuft* (reason) in the philosophy of Kant, Jacobi, and other recent Germans; and probably with Reid's, certainly with Stewart's *Common Sense*. Among the uses of philosophy may be specified the fact that it satisfies the conditions of the proof that there is a God. These conditions are: 1. That intelligence is first in the order of existence. 2. That the universe is governed by moral laws. The phenomena of the material world are subjected to immutable laws. The phenomena of man are, in part, subjected to the laws of the external universe. But what he holds of matter do not make up his personality. They are *his* not *he*. He is not an organism, but an intelligence served by organisms. His intelligence reveals principles of action, absolute and universal, in the law of duty. It is only as he is a free intelligence, a moral power, that he is created in the image of God; and it is only as a spark of divinity glows in us, as the life of our life, that we can rationally believe in an intelligent creator and moral governor of the universe. This has been well expressed by Dr. Henry More:

Nullus in microcosmo spiritus
Nullus in macrocosmo Deus.

If there be no moral world there can be, of course, no moral governor; and we have no ground to believe in the reality of a moral world except as we ourselves are moral

agents. If therefore we could be convinced that we are not moral agents, we should also be convinced that there is no moral order and no supreme intelligence by which such order is established and maintained. Philosophers have been, in the main, agreed in holding this view. Plato says of some that "reversing in themselves the relative subordination of mind and body, they also in the universe make matter prior to mind; so that, starting with this error in relation to themselves, they end in the subversion of the Godhead." Kant declares, "Two things fill the mind with ever rising wonder and reverence, the starry heaven *above* and the moral law *within*." And Jacobi affirms that we believe in God not by reason of nature which conceals him, but by reason of the supernatural in man, which alone reveals and proves him to exist. And with this judgment of philosophers revelation accords; for it is a revelation to man and concerning man; and man is only the object of revelation inasmuch as he is a moral, free, and responsible being. In harmony with this view, the Scriptures are replete with testimonies to our natural liberty.

HAMILTON, Sir WILLIAM ROWAN, LL.D., one of the few really great mathematicians of the present c., was b. in Dublin in Aug., 1805. From his infancy he displayed extraordinary talents, having at the age of 13 a good knowledge of thirteen languages. Having at an unusually early age taken to the study of mathematics, in his 15th year he had mastered thoroughly all the ordinary university course, and commenced original investigations of so promising a kind that Dr. Brinkley, himself a very good mathematician, took him under his especial patronage. His earlier essays, connected with contact of curves, and caustics, grew by degrees into an elaborate treatise on the *Theory of Systems of Rays*, published by the royal Irish academy in 1828. To this he added various supplements, in the last of which, published in 1833, he predicted the existence of the two kinds of conical refraction (see REFRACTION), the experimental verification of which by Lloyd still forms one of the most convincing proofs of the truth of the undulatory theory of light. See LIGHT. The great feature of his *Systems of Rays* is the employment of a single function, upon whose differential coefficients (taken on various hypotheses) the whole of any optical problem is made to depend. He seems to have been led by this to his next great work, *A General Method in Dynamics*, published in the *Philosophical Transactions* for 1834. Here, again, the whole of any dynamical problem is made to depend upon a single function and its differential coefficients. This paper produced a profound sensation, especially among continental mathematicians. Jacobi of Königsberg took up the purely mathematical part of Hamilton's method, and considerably extended it; and of late years the dynamical part has been richly commented on and elaborated by several French mathematicians, all uniting in their admiration of the genius displayed in the original papers. For these researches, Hamilton was elected an honorary member of the academy of St. Petersburg, a rare and coveted distinction. The principle of *varying action*, which forms the main feature of the memoirs, is hardly capable, at all events in few words, of popular explanation. Among Hamilton's other works, which are very numerous, we may mention particularly a very general *Theorem in the Separation of Symbols in Finite Differences*, and his *Examination of Abel's Argument concerning the Impossibility of solving the General Equation of the Fifth Degree*.

We may also particularly allude to his memoir on *Algebra as the Science of Pure Time*, one of the first steps to his grand invention of quaternions. The steps by which he was led to this latter investigation, which will certainly, when better known, give him even a greater reputation than conical refraction or varying action has done, will be more properly treated under QUATERNIONS. On the latter subject he published, in 1853, a large volume of *Lectures*, which, as the unaided work of a single man in a few years, has perhaps hardly been surpassed. Another volume of a more elementary character, on the same subject, containing in addition his more recent improvements and extensions of his calculus, was published after his death, which took place Sept. 2, 1865.

While yet an undergraduate of Trinity college, Dublin, he was appointed, in 1827, successor to Dr. Brinkley in the Andrew's chair of astronomy in the university of Dublin, to which is attached the astronomer-royalship of Ireland. In 1835 he was knighted on his delivering the address as secretary to the British association for its Dublin meeting. He occupied for many years the post of president of the royal Irish academy, and was a member of most of the great scientific academies of Europe. He held during his life, not in Dublin alone, but in the world of science, a position as merited as it was distinguished

HAMILTON COLLEGE, in Clinton, Oneida co., N.Y., was first chartered in 1812 and graduated its first class in 1814. Its origin is due to the foresight and generosity of the rev. Samuel Kirkland, a missionary for more than 40 years among the Oneida Indians. He founded the "Hamilton Oneida academy" in 1793, and gave its trustees several hundred acres of land, and from this the college was developed. The college grounds comprise 45 acres, on which are grouped the college buildings, consisting of three four-story brick halls, with rooms mainly for students, a chapel, a library, and memorial hall, a hall of natural history, a chemical laboratory, and an observatory. The library contains 12,000 volumes. The observatory, endowed by Edwin C. Litchfield, and bearing his name, is furnished with an equatorial telescope with an object

glass 13.5 in. in diameter, and a focal length of almost 16 ft., and various other instruments needed for its equipment. The cabinets contain nearly 2000 specimens in geology, mineralogy, and natural history; and there is besides a herbarium with nearly 1000 samples of plants carefully classified. There is a law department, endowed by W. H. Maynard, with a library of 5,000 volumes, the gift of the late William Curtis Noyes, of New York. The triennial catalogue embraces nearly 2000 names. In the library building there is a memorial hall and an art gallery, designed for tablets, portraits, and other memorials of friends of the college. The productive funds of the institution amount to more than $250,000, and the real estate and collections are valued at $300,000. Number of professors, 12; of students, from 150 to 175; president, S. G. Brown, D.D., LL.D.

HAMILTONIAN SYSTEM, a method of teaching languages, so called from the inventor, an English merchant of the name of James Hamilton, b. about 1769. Having removed to Hamburg in 1798, he took lessons in German, on the understanding that he was not to be troubled with the grammar of the language. He and his teacher read together a German book of anecdotes, the pupil translating word for word after his teacher; and after twelve lessons, Hamilton found himself—so at least we are told—able to read an easy German book. His attention was thus drawn to the subject of learning foreign languages; and finding himself, after a life of vicissitudes, in the city of New York, about the year 1815, he wrote a treatise expounding his views, and commenced putting them in practice. He undertook to teach adults in fifteen lessons to translate the Gospel of St. John from French into English, but found, we are told, ten lessons sufficient. After teaching for a time with great success in America, he returned in 1823 to England, and visited the chief cities, everywhere attracting crowds of pupils, notwithstanding that his system was denounced by many as quackery. He died in Dublin in 1831.

The Hamiltonian method was only one stage in the reaction—begun as early as the time of Comenius (q.v.), and carried on, among others, by Milton and Locke—against the pedantic method of beginning to teach a foreign or dead language by making the learner commit to memory a complete set of grammar rules before he had acquired sufficient practical acquaintance with the language itself in its concrete form, to give the rules any meaning. Hamilton's method of procedure may be shortly summed up as follows: Supposing Latin to be the language to be learned, Hamilton put into the pupil's hands the Gospel of St. John in Latin, with an interlinear version, so literal as to show the gender as well as the number of nouns, etc., and the mood, person, and tense of the verbs. The idioms were not translated by corresponding idioms, but each word by its literal equivalent in English. A fundamental point with Hamilton was to give the primitive, and not the derivative signification of the word, and to give the same signification to the same word in whatever connection it might stand. When the pupil had by this practice got a considerable knowledge of the vocables and accidence of the language, he was practiced in turning the English version back into the Latin. Hamilton undertook in this way to give boys of eleven as much knowledge of Latin in six months as they usually learn at our public schools in six years. One obvious defect of this method is, that no language admits of a word-for-word and uniform translation into another; the method is in this respect misleading. Besides, one great use of learning languages is as a mental discipline, and in this point of view the Hamiltonian system is useless. It may be useful in the case of adults who wish to acquire, with as little labor as possible, a limited power of reading and speaking a language; and in any case, a language once begun to be learned on Hamilton's principles, may be afterwards prosecuted on a better method, thus avoiding the painful initiatory stages of the grammatical method. The necessity, however, of having recourse to the crude method of Hamilton, is superseded in the practice of most modern teachers, who contrive to make the practical and grammatical knowledge of a language go hand in hand.

HAMIRPUR, or HUMEERPOOR, a British district in India in the n.w. provinces, forming the s.w. district of the Allahabad division, bounded on the n. by the Jumna; on the n.w. by the native state of Baoni and Betwa river; on the w. by the Dhasan river; on the s. by Alipura, Chhatarpur, and Charkhari states; and on the e. by the Banda district. It incloses the native states of Sarila, Jagni, and Bihat, besides portions of Charkhari and Garrauli. Pop. '72, 529,137. Hamirpur forms part of the great plain of Bundelkhand, which stretches between the banks of the Jumna and the central Vindhyan plateau. The district is in the shape of an irregular parallelogram, with a general slope northward from the low hills on the southern boundary. The scenery is rendered picturesque by the artificial lakes of Mahoba. These magnificent reservoirs were constructed by the Chandel rajas about 800 years ago, for the purpose of irrigation and as sheets of ornamental water. Many of them inclose craggy islets or peninsulas, crowned by ruins of granite temples, exquisitely carved and decorated. From the base of this hill and lake country the general plain of the district spreads northward in an arid and treeless level towards the broken banks of the rivers. Of these the principal are the Betwa and its tributary the Dhasan, both of which are unnavigable. There is little waste land, except in the ravines by the river sides. The deep black soil of

Bundelkhand, known as mar, retains the moisture under a dried and rifted surface, and renders the district fertile.

HAMLET. See AMLETH, *ante*.

HAMLIN, a co. in e. Dakotah formed after 1870; traversed by Big Sioux river; 720 sq. miles. It is mostly level and bare of timber.

HAMLIN, CYRUS, D.D., LL.D., b. at Waterford, Me., 1811; graduated at Bowdoin college 1834, and at Bangor theological seminary 1837. In 1838 he went to Constantinople, Turkey, as a missionary under the direction of the American board; and, in this capacity, established the seminary at Bebek in 1840. Having in 1860 resigned his relation to the board, he spent 13 years in establishing and presiding over Robert college, an institution in Constantinople named after its founder, Christopher R. Robert of New York city. While on a visit to the United States engaged in promoting the interests of the college, he accepted the chair of theology in Bangor seminary, to which, in 1877, he was called. In 1880 he was elected president of Middlebury college, Vt., and now holds the office. Bowdoin college and Harvard university have conferred on him the degree of D.D.; and the same college and the university of New York that of LL.D.

HAMLIN, HANNIBAL, b. Me., 1809; commenced life as a printer, but studying law was admitted to the bar in 1833; was democratic representative in congress 1843–47, but in 1856 withdrew from his party and in the republican interest accepted the governorship of Maine. In 1860 he was vice-president of the United States; and for a time occupied the position of collector to the port of Boston. In 1869 he was once more elected U. S. senator.

HAMLINE, LEONIDAS LENT, 1797–1865; b. Conn.; studied for the Presbyterian ministry, but afterwards studied law and practiced in Ohio. In 1830, however, he became a preacher in the Methodist church, and in 1840 was chosen assistant editor of the *Western Christian Advocate* and chief editor of the *Ladies' Repository*. In 1844, when the Methodist church divided n. and s. on slavery, he was a member of the general conference, and drew up the plan of separation. He was elected bishop at that session, and served until 1852. His writings are devoted chiefly to the illustration and defense of the Wesleyan doctrine of sanctification.

HAMM, a t. of Prussia, in the province of Westphalia, is situated on the left bank of the Lippe, 22 m. n.n.w. of Arnsberg. It is surrounded by an old wall now converted into a promenade, and by a ditch; contains a castle, gymnasium, and college, and carries on the manufacture of linen extensively. Iron is also produced. Hamm was formerly one of the Hanse towns. Pop. '75, 18,904.

HAMME, a t. in East Flanders, Belgium, on the right bank of the Durme, near its junction with the Scheldt, 18 m. e.n.e. of Ghent. It contains grain and oil-mills, has manufactures of lace, ribbons, linen, starch, ropes, and cordage, and carries on trade in flax. Pop. '76, 10,778.

HAMMER-PURGSTALL, JOSEPH VON, Baron, 1774–1856; b. Austria; was named von Hammer, and adopted the name by which he is known, on receiving a legacy comprising the estates in Styria, of the countess of Purgstall. Having studied the oriental languages in Vienna, and displaying a surprising facility in their acquirement, he was appointed interpreter to the internuncio at the Porte in 1799, and continued in the Austrian diplomatic service until 1817, when he was made aulic counselor. In 1847–49 he was president of the academy of Vienna. Meanwhile he wrote constantly on all subjects bearing relation to the east and in most of the European languages. He translated from the Arabic, Persian, and Turkish, works hitherto unknown in Europe. He also wrote concerning the eastern races, their antiquities, philology, music, literature, etc. One of his most important works was the *Literaturgeschichte der Araber*. He also wrote the *Geschichte der Assassinen* and *Geschichte der Osmanischen Dichtkunst*. At the period of his death, at 82 years of age, this remarkable man retained his buoyancy of mind, and he pursued his industrious habits to the last.

HAMMER-BEAM, a portion of an open timber roof, forming a truss at the foot of the rafter, which gives strength and elegance to the construction. It looks as if there had been a tie right across, and the center part being cut out, the remnants at each end form the hammer-beam. The end next the apartment is usually ornamented with shields, heads, pendants, etc.

HAMMER-CLOTH, a cloth which covers the driver's seat in some kinds of gentlemen's carriages. The term is believed to be a corruption of hammock-cloth, the seat which the cloth covers being formed of straps or webbing stretched between two crutches, as a sailor's hammock is suspended. Ease of motion, as in the case of springs, is the cause of this arrangement. Hammer-cloths are usually ornamented with fringes, and bear the arms of the proprietor of the carriage. They are old-fashioned, and now more seldom seen than formerly.

HAM'MERFEST, the principal t. and trading port of Finmark (q.v.), in Norway, and the most northern town of Europe, is situated in 70° 40′ n. lat., and 23° 30′ e. long. Pop. about 2000. Hammerfest is situated in a barren treeless district, in the rocky island of Kvaloe ("Whale island"), and consists of one long street skirting a wall of

rock. The harbor is good, and presents a busy appearance during summer, when it is visited by some 200 vessels, which bring hemp, meal, potatoes, and other provisions, in exchange for oil and fish (the staple commodities of the island), reindeer hides, eider-down, and fox-skins. During the two summer months the sun is continually above the horizon, and the heat is very great, yet the winter, singular to say, is mild enough to allow of the fisheries being carried on. Copper from the works at Kaafiord, which have been in the hands of an English company since 1847, is also sent to England from Hammerfest. Hammerfest is the northern limit of the birch.

HAMMER-HEAD, or HAMMER-HEADED SHARK, *Zygæna* or *Sphyrna*, a genus of fishes of the great family of sharks; having the general form and characters of the family, but distinguished from all other fishes by the extraordinary form of the head, which, in the adults, resembles a double-headed hammer, being extended on both sides to a considerable length, and having the eyes at the ends of the lateral extensions. The mouth is below the center of the head. The hammer-headed form is not nearly so perfect in the young as in the adults. It is supposed to be intended for enlargement of the sphere of vision. In the fœtal state, the lateral extensions are doubled upon themselves. The hammer-heads are ovo-vivi-parous, and produce many (about forty) young at a birth. They are most abundant in tropical seas. In the bight of Benin, "they may often be seen ascending from the clear blue depths of the ocean like a great cloud." They are very voracious. Some of them attain a great size. One species (*Z. malleus*) has been taken on the British coasts. It attains a length of 12 ft. or upwards. It chiefly belongs to the warmer parts of the Atlantic ocean.

HAMMERSMITH, a village of England, in the co. of Middlesex, about 6 m. w.s.w. of the London post-office, is situated on the Thames, which is here crossed by an elegant suspension bridge, completed in 1827, at a cost of £80,000. The grounds in the vicinity are occupied as nurseries and market-gardens, from which a large supply of flowers and vegetables is sent to the city. The parish church, a plain brick building with a low tower, was erected in 1631, and consecrated by Laud, then bishop of London. Hammersmith contains also the convent of the Good Shepherd, and, in connection with it, an asylum for penitent women. Near the Broadway stands the west London hospital, supported by voluntary contributions. There is also a large endowed school, founded by a Mr. William Godolphin, and which takes his name. The premises and grounds of the school-room cover upwards of 4 acres. Formerly, a detached village, and connected with London only in a commercial sense, Hammersmith is now joined to that city by continuous lines of street, and forms essentially a portion of it. The parish of Hammersmith is traversed by 6 very important railways, two of which terminate here. Pop. of the parish in '71, 42,691.

HAMMER, STEAM-HAMMER, a tool used for applying the force of impact, either for the purpose of beating malleable materials into a required form, or for driving nails, wedges, etc. The common hand-hammer consists of an iron head, usually faced with steel, fixed crosswise upon a wooden handle. When one side of the head is thinned out of a wedge form or to a point, this is called the *pane* of the hammer. The *face* is the flat disk which strikes the work. Carpenters' and joiners' hammers have a bent pane with a V-shaped notch, which is used as a bent lever for drawing nails, etc. The pane is sometimes sharpened so as to form an adze or chisel. A multitude of other modifications in the form of hammers are made to suit different kinds of work. Some of the more important of these are treated under the heads of the various operations, such as FORGING, FILE-CUTTING, GOLD-BEATING, etc.

For many purposes, hammers are required of greater weight than a man can wield; and a great variety of power-hammers are used. These, for the most part, are masses of iron raised by steam or other power, and then allowed to fall by their own gravity upon the work. The *helve* or *shingling hammer*, used for compressing the mass of iron drawn from the puddling furnace, and the *tilt-hammer*, used in the manufacturing of shear-steel, are important examples of such hammers. The first is a heavy bar of cast iron about 10 ft. long, weighing 3 or 4 tons and upwards, to which is attached a head of wrought iron faced with steel, weighing nearly half a ton more. It works upon an axis at the end of the bar furthest from the head, and is raised by cams attached to a heavy wheel set in motion by steam or water-power; these cams strike or "lick" a projection extending beyond the head, and thus raise it about 18 or 20 in. at the rate of from 70 to 100 times per minute. The tilt-hammer is similar, but much lighter, and is adapted for striking above 300 blows per minute. In order to obtain this velocity, a short "tail" extends with a downward inclination beyond the axis, and the cams strike this downwards, and thus lift the longer arm of the lever to which the head is attached. These, when worked by steam, as they usually are in this country, are, of course, steam-hammers; but when the term steam-hammer is used without qualification, it applies to another and more elaborate machine of very different construction, invented by Mr. James Nasmyth in 1842, and subsequently modified and improved in some of its minor details. In this, the hammer is attached to the bottom of a heavy mass of iron, the "hammer-block," capable of rising and falling between upright bars or "guides;" this, again, is fixed to the rod of a piston, which works in a cylinder placed perpendicularly over the hammer-block, hammer, and anvil. As the piston rises in the

cylinder, it lifts the attached mass, which is then allowed to fall from varying heights, according to an adjustment which can be made by an attendant simply touching a handle. The adjustments are so perfect that it may be made to crush a mass of iron, and at the next blow to crack a nut held in the fingers without damaging either kernel or fingers, or to crack the top of an egg in an egg-cup, as might be done with the bowl of a spoon. The mechanism by which this is effected is too elaborate to be described here in detail. One novel contrivance, viz., the "latch," which reverses the action of the steam-valves at the precise moment required, is of remarkable ingenuity.

In the first "Nasmyths" that were used, the weight of the descending mass—viz., the hammer-block, hammer, etc.—was from 30 to 60 cwts., and they were justly regarded as mechanical marvels. Steam-hammers with a descending mass of 20 to 50 tons have since been constructed. In order to compare the power of these with the "helve" or other hammers, which descend by angular motion on a pivot, it must be remembered that these latter, when formed of a straight bar, are only effective to the extent of a body of one-third of their weight falling directly from a corresponding height, on account of the fact that the whole bar forming the hammer is moving with a velocity varying from nothing at the axis, to a maximum at the end of the bar, where the hammer-face is fixed.

HAMMOCK, the apparatus in which a sailor slings his bed, derives its name through the Spanish *hamac*, from a Peruvian word; the custom of thus suspending a bed having been derived from Peru, where the natives fasten the two ends of a piece of canvas, or of a netting of grass twist, to the branches of a tree, and lie suspended on it in luxurious ease. A sailor's hammock consists of a rectangular piece of hempen cloth, about 6 ft. long and 3 in width, gathered together at each end by means of cords and a clew, and hung to hooks under the deck. The hammock thus suspended forms a sort of bag capable of containing the sailor's mattress, his blankets, and himself, as soon as he has acquired the far from easy knack of climbing into it. The hammocks are taken below at sunset, and hung in rows about 2 ft. apart, in the men's portion of the ship. When done with in the morning, the bedding is carefully tied up within each, and the whole stowed in the hammock-netting, which is generally in the bulwarks of the waist. If the weather be not sufficiently dry, however, to allow of this, the hammocks are left below. Stowed thus in the netting, the hammocks form a strong barrier against small shot.

HAMMOND, EDWARD PAYSON, b. Conn., about 1835; an evangelist, graduated at Williams college in 1858, studied at the Union theological seminary in New York, and going to Ireland in 1859, became conspicuously active in the religious revival then in progress at Ballymena, near Belfast. He continued his studies at the university of Glasgow, where he graduated in theology in 1861, having meanwhile become widely distinguished for evangelistic work in Scotland, England, and Wales. Returning to America in 1861 he carried on a revival work with great success in Portland, Me.; and since then has been widely known in evangelistic work in all parts of the United States and Canada. He has a residence in his native town, Vernon, Conn., to which he retires in the seasons of rest from revival work. He has at different times traveled widely in Europe and Palestine, and is the author of some books for children, and the compiler of hymn books used in his meetings.

HAMMOND, HENRY, D.D., a learned English divine and able controversial writer, the youngest son of Dr. John Hammond, a physician, was b. at Chertsey, Surrey, Aug. 18, 1605. Educated at Eton, he was, in 1618, sent to Magdalen college, Oxford, where he sedulously applied himself to classical studies. In July, 1625, he became a fellow of his college, and in 1629 entered into holy orders. In 1633 he was presented to the rectory of Penshurst, in Kent, and in 1643 he became archdeacon of Chichester. Hammond followed the unfortunate Charles to the isle of Wight, and continued with the king as his chaplain till his attendants were dismissed, in 1647; he then returned to Oxford, and was chosen sub-dean of Christchurch. In 1648 he was deprived of his college offices by the parliamentary commissioners, and shortly after retired to Westwood, in Worcestershire, the seat of sir John Packwood, where the remainder of his life was spent in literary labor. He died April 25, 1660. His celebrated work, the *Paraphrase and Annotations on the New Testament*, was published in 1653. A new and enlarged edition came out in 1656, but the best edition is that of 1702. His collected works were published, in 4 vols. folio, in 1674–84. His sermons and minor works are reprinted in the Oxford *Library of Anglo-Catholic Theology*.

HAMMOND, JAMES HAMILTON, 1807–64; b. S. C.; graduated from South Carolina college, was admitted to the bar, and in 1830 was the editor of the *Southern Times*, published at Columbia. He was an advocate of nullification. In 1835 he was in congress, and in 1842 was governor of South Carolina. He wrote on the side of slavery in answer to Thomas Clarkson's attacks, *The Pro-Slavery Argument*, and also many essays on agriculture, finance, etc. He was U. S. senator in 1857, and the next year proclaimed in his speeches that northern laborers were "the mudsills of society," and that "cotton is king, and no power on earth dare make war upon it." Naturally he went with his state in the rebellion, and left his place in the senate.

HAMMOND, SAMUEL, 1757–1842; b. Va.; while a boy he served in wars against the Indians, and in 1779 raised a company in support of the revolution. He was in the fight at Stono Ferry and in other engagements in the south. In 1793 he led a regiment against the Creek Indians in Georgia. In 1805 he was military commander of upper Louisiana; in 1831 secretary of the state of South Carolina.

HAMMOND, WILLIAM ALEXANDER, b. Md., 1828; graduated in medicine at the New York university in 1848; the next two years was assistant surgeon in the regular army; and in 1860 professor of physiology and anatomy in Maryland university. In 1861 he re-entered the military service as assistant surgeon, and in 1862 was appointed surgeon-general. In 1864 he became professor of mental and nervous diseases and of clinical medicine in Bellevue hospital medical college, New York, and physician-in-chief for diseases of the nervous system in New York state hospital. Dr. Hammond has published a number of valuable works, among which are *A Treatise on Hygeine, with special reference to Military Science; Physiological Memoirs; Lectures on Venereal Diseases; On Wakefulness with introductory chapter on Sleep; Insanity in its Medico-legal Relations; Sleep and its Derangements; Physics and Physiology of Spiritualism; Treatise on Diseases of the Nervous System; Insanity in its Relations to Crime*, etc., besides editing *Medical and Surgical Essays*, and translating Meyer's *Electricity in its Relations to Practical Medicine*.

HAMON, JEAN LOUIS, 1821–74; a French painter. At an early age he was destined to the priesthood, but his strong desire to become a painter finally triumphed over family opposition, and in 1840 he repaired to Paris. Here he received valuable counsel and encouragement from Delaroche and Gleyre, and in 1848 he made his appearance at the *salon* with "Le tombeau du Christ," and a decorative work, "Dessus de Porte." His paintings, up to 1849, had attracted little public notice, and he was content to accept a place in the manufactory of Sevres, but an enameled casket by his hand having attracted attention at the London international exhibition of 1851, he received a medal, and, re-inspired by success, left his post to try his chances again at the *salon* of 1852. "Le Comédie Humaine," which he then exhibited, turned the tide of his fortune, and "Ma soeur n' y est pas" (purchased by the emperor) obtained for the artist a third-class medal. At the Paris international exhibition of 1855, when Hamon re-exhibited the casket of 1851, together with several vases and pictures, of which "L'Amour et son Troupeau," "Ce n' est pas moi," and "Une Gardeuse d' Enfants," were the chief, he received a gold medal of the second class, and the ribbon of the legion of honor. In the following year he was absent in the east, but in 1857 he reappeared with "Boutique à quatre Sous," "Papillon enchainé," "Cantharide esclave," "Dévideuses," etc., in all, ten pictures; "L'Amour en visite" was contributed to the *salon* of 1859, and "Vierge de Lesbos," "Tutelle," "La Volière," "L'Escamoteur," and "La Souer ainée," were all seen in 1861. Hamon now spent some time in Italy, chiefly at Capri, whence in 1864 he sent to Paris "L'Aurore Un Jour de Fiançailles." The influence of Italy was also evident in "Les Muses à Pompéi," his sole contribution to the *salon* of 1866, a work which enjoyed great popularity and was re-exhibited at the international exhibition of 1867; together with "La Promenade," and six other pictures of previous years. His last work, "Le triste Rivage," appeared at the *salon* of 1873. It was painted at St. Raphael, where Hamon had finally settled in a little house on the shores of the Mediterranean, close by Alphonse Karr's famous garden. Hamon was remarkable for delicacy of coloring, as well as for effective grouping and general composition.

HAMOON'. See SEISTAN, LAKE OF.

HAMPDEN, a co. in w. central Massachusetts, on the Connecticut, Westfield, Chicopee, and Swift rivers, crossed by the New Haven and Northampton, the New London, Northern, and the Connecticut River railroads; 620 sq.m.; pop.'80, 104,117. The surface is diversified with hills and valleys. There is plenty of timber, and water power is abundant. The chief productions are corn, tobacco, hay, and butter. Co. seat, Springfield.

HAMPDEN, JOHN, a celebrated English patriot, said to have been born in London in 1594, was the son of William Hampden of Hampden, Buckinghamshire, and Elizabeth, daughter of sir Henry Cromwell of Hinchingbrooke, Huntingdonshire, aunt of Oliver Cromwell. His father died in 1597, when he was only three years old. In 1609 he was entered a gentleman commoner at Magdalen college, Oxford, and in 1613 was admitted to the Inner Temple, where he made considerable progress in the study of law. On Jan. 30, 1621, he first entered the house of commons as member for the now disfranchised borough of Grampound. He attached himself to the party of St. John, Selden, Coke, Pym, and those who opposed the arbitrary encroachments of the crown, but at first took no very forward part in public business, and spoke but seldom. In the first three parliaments of Charles I., he sat for Wendover. In 1627, for refusing to pay his proportion of the general loan which the king attempted to raise on his own authority, Hampden was committed to close imprisonment in the Gatehouse. Subsequently, he was removed to Hampshire, but, with seventy-six others, unconditionally liberated by an order of council. His activity and industry in parliament now rendered him one of its leading and most useful members; he was on most of its committees; but after the

dissolution of the parliament of 1628–29, he retired to his estate, and devoted himself to study and to country sports and occupations. Claiming the power to tax the country in any way he thought proper, in 1634, Charles had recourse to the impost of ship-money. At first, limited to London and the maritime towns, and levied only in time of war, it was, in 1636, extended to inland places in time of peace, when Hampden resolutely refused to pay it, and his example was followed by nearly the whole county of Buckingham. In 1637 he was prosecuted before the court of exchequer for non-payment, when a majority of the judges gave a verdict against him. In the short parliament of 1640 Hampden took a prominent part in the great contest between the crown and the house of commons. To the long parliament he was returned both for Wendover and the county of Buckingham, and made his election for the latter. For his resistance to the king's proceedings, he was one of the five members whom Charles, on Jan. 4, 1642, rashly attempted in person to seize in the house of commons; and on the breaking out of the civil war, he raised and became col. of a regiment in the parliamentary army under the earl of Essex. He was also a member of the committee of public safety, and in the prosecution of the war, constantly advised prompt and energetic measures. He was present at the repulse of the royalists at Southam, at their defeat near Aylesbury, at the fight at Edgehill, and at the assault and capture of Reading. Prince Rupert having attacked a parliamentary force at Chinnor, near Thame, Hampden put himself at the head of a few cavalry that were rallied in haste to oppose him, and in the fight that ensued at Chalgrove Field, received in the first charge a wound of which he died six days after, on June 24, 1643. He was twice married, and by his first wife had three sons and six daughters.

HAMPDEN, RENN DICKSON, D.D., 1793–1868; bishop of Hereford; b. Barbadoes; educated at Oxford. Having left the university in 1816, he held successively the curacies of of Newton, Faringdon, and Hackney, and in 1827 he published *An Essay on the Philosopical Evidence of Christianity*, followed by a volume of *Parochial Sermons illustrative of the importance of the Revelation of God in Jesus Christ.* In 1828 he returned to Oxford as tutor of Oriel, and after having twice acted as public examiner in classics, he was selected to preach the Bampton lectures in 1832, when he chose for his subject *The Scholastic Philosophy considered in its Relation to Christianity.* Notwithstanding a charge of Arianism, he became principal of St. Mary's hall, and professor of political economy, and in 1836 regius professor of divinity. There resulted a widespread and violent though ephemeral controversy, after the subsidence of which he published a *Lecture on Tradition*, which has passed through several editions, and a volume on *The Thirty-nine Articles of the Church of England.* His nomination by lord John Russell to the vacant see of Hereford in Dec., 1847, was again the signal for a violent and organized opposition; and his consecration in March, 1848, took place in spite of a remonstrance by many of the bishops and the resistance of Dr. Merewether, the dean of Hereford, who went so far as to vote against the election when the *conge d' elire* reached the cathedral. Among the more important of his later writings were the articles on Aristotle, Plato, and Socrates, contributed to the eighth edition of the *Encyclopædia Britannica*, and afterwards reprinted with additions under the title of *The Fathers of the Greek Philosophy* (Edinburgh).

HAMPDEN-SIDNEY COLLEGE, in Prince Edward co., Va., founded in 1775. Among the early trustees were Patrick Henry and James Madison. Rev. Samuel Stanhope Smith was the first president, succeeded by rev. John Blair Smith, rev. Archibald Alexander, and rev. Moses Hoge. At present J. M. P. Anderson, D.D., is the presiding officer. There is no preparatory school, nor any professional school. Diplomas are awarded only to students who have passed through the full course prescribed.

HAMPSHIRE, a co. in w. central Massachusetts, intersected by the Connecticut, Chicopee, Westfield, and Swift rivers, and by the New Haven and Northampton, the New London Northern, and the Connecticut river railroads; 600 sq.m.; pop. '80, 47,235. The surface is hilly and the soil fertile; chief productions: corn, hay, tobacco, etc. There are many manufacturing establishments. Co. seat, Northampton.

HAMPSHIRE, a co. in e. West Virginia, s. of the Potomac, intersected by the Cacapon river and reached by the Baltimore and Ohio railroad; 640 sq.m.; pop. '70, 7,643—640 colored. The surface is rough and to a large extent covered with forests. Corn, wheat, and hay are the main products. Iron is found. Co. seat, Romney.

HAMP'SHIRE, SOUTHAMP'TON, or familiarly HANTS, a maritime co. in the s. of England, is bounded on the w. by Dorset and Wilts, on the n. by Berks, on the e. by Surrey and Sussex, and on the s. by the English channel. The county, including the isle of Wight, has an area of 1,070,216 acres, 900,000 of which are estimated to be under culture. Its pop. in '61 was 481,495; and in '71, 544,684. The surface is irregular, being traversed by the North and South Downs. The s.w. portion of the county, almost wholly detached from the main portion by the Southampton water, is occupied mainly by the New Forest. This tract is 64,000 acres in extent, is the property of the crown, and is valuable for the oak and beech timber obtained from it for the use of the British navy. Within the forest, an aboriginal breed of pony is still found. Besides that called the New Forest, there are also remains of those of Bére, Alice Holt, Wool-

mer, etc. The principal rivers are the Anton or the Test, and the Itchen, which flow southward through the county into the Southampton water, and the Avon, also flowing southward, and forming the western boundary of the New Forest. The climate of the county is in general mild, and favorable to vegetation; indeed, the climate in the s. of the isle of Wight is supposed to be milder than that of any other portion of Great Britain. The soil consists in part of poor sands and gravel, and of a mixture of stiff clay and chalk. All the usual crops are produced, hops are cultivated, and the bacon cured here is famous. The manufactures of the county are inconsiderable. Southampton and Portsmouth, both termini of important railways, are the chief centers of trade. The county, exclusive of the boroughs and the isle of Wight, sends four members to the house of commons. The New Forest seems to have been fatal to the family of William the conqueror; there two of his sons, and his grandson, met with sudden and violent deaths. Of the early ages of English history, Hampshire contains many interesting relics: of these the chief are Porchester castle, at the head of Portsmouth harbor; Calshot and Hurst castles, now occupied as coast-guard stations, erected in the time of Henry VIII., and Netley and Beaulieu abbeys, and the priory of St. Dionysius, all in the neighborhood of Southampton. The county is exceedingly rich in Roman remains, as coins, urns, pottery, etc. For further information on the antiquities and history of the towns of Hampshire, see articles WIGHT, ISLE OF; WINCHESTER, etc.

HAMPSTEAD, a village of England, in the co. of Middlesex, is finely situated on a range of hills 4 m. n.n.w. of London. It was formerly famous for its medicinal springs, and is still a favorite place of residence and of holiday resort among Londoners, who are attracted to it by the beauty of its situation and the purity of its air. On the summit of the hill, above the village, is the Heath, which affords extensive and pleasant prospects of the surrounding country. On the Hampstead road, and in the vicinity of the village, many handsome villas have been erected. Pop. '71, 32,281. A house on the Heath, formerly called the Upper Flask inn, and now a private residence, was at one time a place of resort of the famous Kit-Kat club, at which Steele, Addison, Richardson, and others used to assemble. The village of Hampstead was much frequented by Pope, Gay, Johnson, and Akenside, and later by Byron, Leigh Hunt, and Johanna Baillie.

HAMPTON, a t. in Rockingham co., N. H., on the Eastern railroad, 47 m. n.e. of Boston; pop. 1177. The place was settled in 1638 near a block-house which was put up two years before to mark the n.e. boundary of Massachusetts. The settlers, chiefly from Norfolk, England, were long subjected to Indian troubles. It is now a thriving and handsome village. Three m. to the s.e., on the ocean, is Hampton beach, a watering-place of wide repute. Here is Boar's Head, a cliff 70 ft. above tide, affording magnificent marine views. On the s. are all kinds of large and small beaches all the way to cape Ann. Mt. Agamenticus is seen to the n. beyond the village of Rye, and the isles of Shoals are off-shore to the n.e. The beach at Hampton affords excellent facilities for bathing, promenade, and driving.

HAMPTON, a small village on the Chesapeake bay, in Virginia, U. S., giving its name to Hampton roads, a southerly branch of Chesapeake bay, and mouth of James river, one of the best harbors on the American coast, defended by fortress Monroe and fort Calhoun. These roads were the scene of important events in the American revolution, the war of 1812, and the civil war of secession, especially of the first naval battle between iron-clad vessels, the *Virginia* or *Merrimac* and the *Monitor*. Pop. '70, 2,300.

HAMPTON, a village of England, in the co. of Middlesex, is pleasantly situated on the left bank of the Thames, about 12 m. s.w. of London. The streets are narrow, and the houses irregularly built; in the vicinity, however, there are many noble mansions and beautiful villas. Pop. 71, 2,207.

HAMPTON COURT PALACE, long a royal residence, and now usually occupied by persons of rank reduced in circumstances, stands about a mile from the village in the midst of grounds that extend to the Thames. The original palace was erected by cardinal Wolsey, and came afterwards into the possession of Henry VIII., who enlarged it, and formed around it a royal park or chase, which he stocked with deer. Here Edward VI. was born, and here his mother, queen Jane Seymour, died. Charles I. underwent a portion of his confinement at this palace, and it was the occasional residence of Cromwell, Charles II., and James II. A considerable portion of it was rebuilt by William III., and by him the park and gardens were laid out in the formal Dutch style. The palace, as it at present stands, consists of three quadrangles with some smaller courts; the great eastern and southern fronts having been erected by Sir Christopher Wren. The picture-gallery comprises Lelly's "Beauties of the Court of Charles II.," valuable specimens of Holbein, Kneller, West, etc., and above all, seven unequaled cartoons by Raphael. The gardens, which are about 44 acres in extent, and have not been materially altered since they were laid out by William III., present a series of curious raised terraces, formal flower-plots, and long shady and trim arcades. Among other attractions of the gardens is a "maze" or labyrinth, which furnishes much amusement to youthful visitors.

HAMPTON, WADE, 1754–1835; b. S. C. He was a bold and distinguished partisan under Marion and Sumter in the war of the revolution. In 1795 he was in congress, and was re-elected in 1802. In the war with Great Britain (1812–15) he was a maj.gen. He was very obnoxious to other officers, because of his overbearing disposition. At one time he was the owner of 3,000 slaves.

HAMPTON, WADE, b. S. C., 1818. He is the grandson of the great slaveholder, and inherits much of the father's rashness. Graduated at the state university he became a lawyer, and was at an early age in the legislature. In the war of the rebellion he was one of the confederate leaders in command of the Hampton legion (cavalry), and was wounded at Bull Run. Rising to the rank of brig.gen. he was in the battle of Seven Pines, and again wounded. Still another wound was received at the battle of Gettysburg. In 1864 he was made lieut.gen., and in 1865 he was in command of the rear-guard at Columbia, S. C., when a great part of that city was destroyed by fire. In 1877 he became governor of South Carolina, after a long dispute whether he or gov. D. H. Chamberlain was rightfully entitled to that office. He was chosen again governor in 1878, and the same year was elected to the U. S. senate to serve six years, from Mar. 4, 1879.

HAMPTON COURT CONFERENCE, a conference which took place at Hampton court, shortly after the accession of James I. to the throne of England, in order to the settlement of ecclesiastical disputes. The king presided and took a principal part in the conference. He was attended by some of the nobility and highest officers of state, but no one seems to have been permitted to take any part in the proceedings except the king himself and the divines whom he had summoned. Of these, the representatives of the Episcopalian party were more numerous than the Puritans; and the Puritans, although men of known worth and learning, were among the least extreme of their party. Archbishop Whitgift, with eight bishops, six deans, and an archdeacon, appeared on the Episcopalian side; two Oxford professors of divinity, two divines from Cambridge, and along with them Mr. Patrick Galloway, minister of Perth, in Scotland, maintained the Puritan cause. On the king's accession, the Puritans, entertaining great hopes of release from the rigid enforcement of ceremonies which galled their consciences, and of the reformation of abuses in the church, had addressed a petition to the king, known as the *Millenary Petition*, because it was signed by nearly 1000 ministers in all parts of the country. But the king's intention was not to comply with their wishes, and the Hampton court conference seems to have been merely a device for making it appear that their demands had been considered and found unreasonable. On the first day of the conference, Jan. 12, 1604, the Episcopalians alone were admitted to the presence of the king, who demanded their opinion, which they gave, on the third day after, in favor of the existing system in all the parts complained of. The king debated with them on some points; and in the end, decided against them in a few minor particulars, thus maintaining the assertion of his own ecclesiastical supremacy, as well as finding an opportunity for the display of his attainments in theology, although in all that was most important, his verdict was in their favor. On Jan. 16, the Puritans were called to the king's presence, but along with them some of the Episcopalians, when James debated keenly against the Puritans, using language very unworthy of a king or of a Christian, and according to his own account of the matter, "peppered them soundly." On Jan. 18, both parties were called in, and the royal judgment intimated, which was afterwards announced in a proclamation very adverse to the Puritans.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE, for the instruction of negro and Indian pupils, stands on the e. shore of Hampton creek, a little below the town of Hampton, Va., 2½ m. from fortress Monroe, on an estate of 190 acres, once known as "Little Scotland." It owes its existence to the American missionary association, which purchased this estate in 1867 and opened a school on the manual labor basis in 1868. The labor of its organization was largely devolved on its enthusiastic and indefatigable principal, Samuel C. Armstrong, who early succeeded in gathering an unusually zealous and efficient company of teachers and helpers. The place was selected for its natural beauty and healthiness, as well as for its accessibility, and partly also because it is surrounded by a numerous colored population. In 1870 the institution received a charter from the state of Virginia, and it is now controlled by a board of trustees, with power to choose their successors, the property having been transferred to them upon condition that the religious teaching of the school shall be evangelical. It is neither a college nor a university, but a school adapted to the immediate needs of the colored population of the southern states, the managers, of course, having power at any time to enlarge its scope as circumstances may require. It has invested funds amounting to $79,814. Its income from all sources, including the interest of the state agricultural land fund ($10,000), interest of invested funds ($2,500), and voluntary contributions, is from $30,000 to $35,000 annually. Several of its buildings were burned in Nov., 1879, and are not yet wholly replaced, but will be ere long. The principal structures are academic hall, of brick, 110 by 70 ft., in the form of a Greek cross, used for school and recitation rooms, and boys' sleeping-rooms; Virginia hall, of brick, 192 by 40 ft., with central wing extending 100 ft. in the rear, used for girls' and teachers' rooms, and containing also a large chapel, students' dining-hall, laundries, kitchens, printing-office,

knitting-room, etc. The smaller buildings are two cottages for boys' rooms, wigwam for the use of Indian students, dwelling-houses for managers and teachers, barns and out-houses, ice-house, saw-mill, engine-house, and the Butler school-house. The institute also owns a farm of 339 acres, called "Shellbanks," on Back river, 7 m. from the school. This farm—the gift of a friend—is used for keeping and raising stock, and, in summer, for an Indian camp, and the labor upon it is mainly performed by the students, the institution being founded on the manual labor plan. The laboratories and apparatus were destroyed by fire in 1879, and have been only partially replaced. The museum, with its collections, and the library also, have been greatly injured by fire. The latter contains 600 volumes, and embraces a reading-room, where from 50 to 80 periodicals and newspapers are kept on file for the use of the students. A monthly periodical, *The Southern Workman*, devoted to the industrial classes of the south, is printed on the grounds, affording occupation for some of the students and an admirable vehicle for advertising the advantages of the school. The departments of instruction are two, academic and industrial, the former embracing a three years' course of English branches, including mathematics through algebra, with intellectual philosophy, civil government, political economy, book-keeping, history, English literature and composition, natural philosophy, chemistry, and practice in teaching. In the industrial department instruction is given in farming and in the following mechanical branches: carpentry, shoemaking, blacksmithing, tailoring, iron and tin-work, housework, cooking, and sewing and knitting by machine. The school has a military organization, as required by the act of congress appropriating the land-fund; an officer of the army being detailed by the government to give instruction. Calisthenic exercises are taught in the senior class to boys and girls alike, both sexes being admitted to the school on equal terms. Pupils on entering are only required to have a knowledge of the primary rules of arithmetic and to be able to read and write, and there is a primary department in which so much is taught. The whole number of pupils up to 1880 is 1429; of these 353 have graduated, and not less than 90 per cent of the number have devoted themselves to the work of teaching those of their own color, thus fulfilling one of the great objects of the institution, which is to raise up teachers for the free schools of the south. From 10,000 to 20,000 colored children were taught by these graduates in 1879–80, and their work is highly prized by the educational directors of the south. Since 1878 the institute has had as pupils a considerable number of Indian children and youth, sent thither by direction of the Indian department in Washington, and the results of this effort to instruct them in the elements of civilized life are thus far of the most satisfactory character. The principal of the institute bears testimony to the safety and advantages of educating the sexes together.

HAMPTON ROADS (Hampton, *ante*), the lower part of an expansion of James river, Va., where it falls into Chesapeake bay. It is an important military point, and is defended by forts Wool and Monroe. The light at the entrance from the sea is in 37° 42′ n., and 76° 14′ w. During the war of the rebellion there were two naval engagements in and near Hampton Roads. Mar. 8, 1862, the frigate *Congress*, the sloop-of-war *Cumberland*, the steam frigates *Minnesota* and *Roanoke*, and the ship *St. Lawrence* were in the roadstead, when the *Virginia*, an iron-clad confederate craft, formerly the U. S. steam frigate *Merrimac*, which had been seized the year before, attended by two small steamers, came from Norfolk, passed rapidly by the *Congress*, exchanging broadsides, and ran directly into the *Cumberland*, which sunk in less than three-quarters of an hour. The *Congress* was disabled and set on fire, and eight hours later her magazine exploded. The other union vessels escaped. The union loss was 286; that of the confederates only about a dozen. The next day the union iron-clad *Monitor*, the first turret vessel ever used, appeared on the scene, and between her and the *Virginia* a long action ensued. The *Monitor* could not be run down nor boarded, and near night the *Virginia* gave up the fight and retired to Norfolk, leaving the strange little steamer unharmed.

HAMSTER, *Cricetus*, a genus of rodent quadrupeds of the family *muridæ*, resembling the true mice and rats in their dentition, but having cheek-pouches, and a short hairy tail. The COMMON H. (*cricetus vulgaris*) is a native of the n. of Europe and of Asia, abundant in many parts of Germany and Poland, but not found in Britain, and rare to the w. of the Rhine. It is of variable color; although generally reddish gray above, the belly black, the feet white, and large white spots on the sides, throat, and breast. It is larger and of stouter form than the common rat, the tail only about 3 in. long. It burrows in dry soils, each individual making a burrow for itself, to which there are more entrances than one, and which also contains several holes or compartments, one of them lined with straw or hay, in which it sleeps, and some of them capacious enough for the storing of large quantities of grain or other provisions—to the amount of 60 lbs. of corn or a hundredweight of beans—which the animal carries thither in its cheek-pouches, and on which it feeds during the milder parts of winter, spending the most severe part of that season in a state of torpid hibernation. It is a great pest to the farmers of the countries in which it abounds, and the object of their unceasing hostility; but it is very prolific, producing 2 or 3 broods in the year, and 16 or 18 at a birth. It feeds generally on vegetable food, as leaves, seeds, etc., although it is said also sometimes to devour small quadrupeds, birds, lizards, frogs, etc. The hamster carries away peas and other

legumes in pod, but shells them, and deposits only the edible portion in its store. Its labors and depredations are all carried on by night. It is an extremely fierce and pugnacious animal, and exhibits more than the pertinacity of the bull-dog. The skins of hamsters are of some value.—There are several other smaller species of the genus, mostly Asiatic.

HAN, the name of the most celebrated of the 26 dynasties of China (206 B.C. to 220 A.D.), founded by Kau-tsu, whose accession to the empire is regarded as the commencement of Chinese modern history. The number and character of its heroes and literati are superior to most other periods, and to this day the term *sons of Han* is the favorite appellation of the Chinese to themselves—the most common term for Chinamen.

HAN'APER OFFICE, a branch-office of the court of chancery, from which certain writs are issued. The name is derived from the fact that the papers and writs used to be kept in a hamper (*in hanaperio*).

HA'NAU, an industrious and flourishing t. in the Prussian province of Hessen-Nassau, is situated near the confluence of the Kinzig and the Main, 12 m. e.n.e. of Frankfort by rail. It is divided into the old and new town, the latter of which was founded, in 1597, by Protestant refugees from Belgium, who introduced the manufacture of woolen and silken goods, which still flourishes. The town of Hanau stands pre-eminent in Germany for its jewelry, and gold and silver wares, while it also carries on extensive manufactories of carpets, gloves, leather, cards, paper, hats, cutlery, tobacco, and cigars. Hanau has broad and straight streets; the buildings most worthy of note are the ancient castle; a gymnasium, in which the Wetterau library is located; and the electoral palace of Philippsruhe, famed for its orangeries, and once the property of Napoleon's sister, princess Pauline Borghese. Pop. '75, 22,730. In the neighborhood of the town, and on the left bank of the Main, are the baths of Wilhelmsbad and the village of Rumpenheim, with its palace and gardens. Hanau is celebrated as the scene of the last battles which Napoleon fought in Germany, Oct. 30 and 31, 1813, when, in his retreat from Leipsic, after a hard-fought battle, he totally defeated the allies.

HAN'CHINOL, *Heimia salicifolia,* a plant of the natural order *lythaceæ,* with lanceolate, frequently ternate leaves, and flowers on one-flowered stalks. It is a native of Mexico, and is much esteemed as a medicine for its very powerful sudorific and diuretic properties. It is highly extolled as an antisyphilitic.

HANCOCK, a co. in e. central Georgia, on the Ogeechee and Oconee rivers, intersected by the Macon and Augusta railroad; 500 sq.m.; pop. '80, 16,989—11,944 colored. The surface is uneven, and much of it is covered with forests. The soil is tolerably fertile, producing corn, cotton, etc. Various minerals are found. Co. seat, Sparta.

HANCOCK, a co. in w. Illinois, on the Mississippi, intersected by the Toledo, Peoria, and Warsaw, the Burlington and Quincy, and the Wabash railroads; 750 sq.m.; pop. '70, 35,935. It has an undulating surface of prairie and woodland, and the soil is very fertile. Corn, wheat, butter, and pork are the chief productions. Co. seat, Carthage.

HANCOCK, a co. in e. central Indiana, drained by Big Blue river, intersected by the Pittsburg, Cincinnati, and St. Louis, and the Cincinnati, Hamilton, and Dayton railroads; 300 sq.m.; pop. '70, 15,123. It is level, and about a third as yet timber-land. Chief productions: wheat, corn, and oats. Co. seat, Greenfield.

HANCOCK, a co. in n. Iowa, intersected by Boone and Iowa rivers, and the Milwaukee and St. Paul railroad; 576 sq.m.; pop. '75, 1482. The soil is fertile, producing corn, oats, etc. Co. seat, Concord.

HANCOCK, a co. in n.w. Kentucky, on the Ohio river; 200 sq.m.; pop. '70, 6,591—729 colored. It has an undulating and in some parts rough surface. Corn and tobacco are the main crops. Co. seat, Hawesville.

HANCOCK, a co. in s.e. Maine, on the ocean, drained by Penobscot and Union rivers, and including a large number of islands, of which Mt. Desert is the most important; 1700 sq.m.; pop. '70, 36,495. There are many ocean inlets affording good harbors, and in the interior there are numerous lakes and large forests. Butter and lumber are the chief products. Co. seat, Ellsworth.

HANCOCK, a co. in s.w. Mississippi, bordering on Louisianna and the gulf of Mexico; 500 sq.m.; pop. '70, 4,239—1186 colored. Surface level, soil poor. Co. seat, Bay St. Louis.

HANCOCK, a co. in n.w. Ohio, intersected by a branch of Auglaize river, the Lake Erie and Louisville, and the Cincinnati, Sandusky and Cleveland railroads; 525 sq.m.; pop. '70, 23,487. Surface level, with plenty of good timber; the soil a calcareous loam, producing wheat, corn, oats, etc. Co. seat, Findley.

HANCOCK, a co. in n.e. Tennessee, on Clinch river and the Virginia border; 300 sq.m.; pop. '70, 7,148—585 colored. It has a rough and mountainous surface, but the valleys are fertile, producing corn, wheat, pork, etc. Co. seat, Sneedsville.

HANCOCK, a co. in n. West Virginia, a narrow strip between the Pennsylvania line and the Ohio river; 90 sq.m.; pop. '70, 4,363—27 colored. The surface is uneven; soil is fertile, producing corn, wheat, oats, etc. Co. seat, Fairview.

HANCOCK, JOHN, 1737–93; b. Mass., graduated at Harvard, and went into commercial business with an uncle who (in 1764) left him a fortune. In 1766 he was a member of the colonial legislature. Two years afterwards a sloop owned by him, bearing the offensive name of *Liberty*, was seized by the crown officers, and the event created a riot in which the officers were roughly treated. After the Boston massacre Hancock was one of a committee to wait upon the governor and demand that the troops should be taken away from the city. Over the remains of the victims of the massacre he made an oration of great eloquence and greater boldness, which gave serious offense to the royal government, and led to an effort to seize the persons of Hancock and Samuel Adams, an effort which was the cause of the conflict at Concord. The provincial congress met at Concord in March, 1875, and both Adams and Hancock were members, the latter being president. The congress adjourned April 15, and on the night of the 18th men from Boston marched to Concord, arriving at 7½ A.M. on the 19th. A conflict followed, and ended in the battle of Lexington, and the beginning of the revolution. Hancock and Adams escaped, but both were by name exempted from the pardon promised by governor Gage. Hancock was president of the continental congress, and his name in a bold hand stands first among the signers of the declaration of independence, to which it was appended a month before the other signatures. He was in the Massachusetts constitutional convention, and the first governor of the new state, being (with a single interval) re-elected every year until his death. Much of his large fortune was spent for benevolent and useful purposes, Harvard college coming in for a share.

HANCOCK, WINFIELD SCOTT, b. Penn., 1824; graduated at West Point in 1844, and was for two years on the w. frontier in service. He was also in the Mexican war, and received the brevet of first lieut. for his behavior in the actions at Contreras and Churubusco. After that war he was about 10 years on frontier service in connection with the Indian troubles in Florida and the Mormon dissensions in Utah. In 1859 he was made quarter-master, doing duty in California, and by his energy and personal influence did much to keep that state within the union in 1860–61. Being ordered to Washington, at his own request, he was appointed brig.gen. of volunteers, and was prominent in the battle of Williamsburg and the engagement at Frazer's Farm. He was also in the contests of South Mountain and Antietam, in the latter fight being made a division commander on the field, soon after which he was promoted to maj.gen. At Fredericksburg and at Chancellorsville he was in command of the first division, 2d army corps, and was made corps commander (2d) in June, 1863. At Gettysburg he was in command at the point (on the left center) most furiously assailed by the confederates, and received a severe wound just at the close of the last day's fight. Congress voted special thanks for his gallantry on that occasion. The wound kept Hancock out of the field for nearly a year, but in 1864 he participated in the conflicts of the Wilderness, of Spottsylvania court-house, and Cold Harbor. In Nov. he organized at Washington the first corps of veterans. In recent years he has had department commands, the middle military division, the 5th military district, including Louisiana and Texas (1867–68), that of Dakotah, and, since the death of gen. Meade, the department of the east, with head-quarters at Governor's island, New York. In 1868 the democrats were inclined to make Hancock their candidate for president, but Horatio Seymour received the nomination. In the democratic national convention of 1880 Hancock was named, and had 171 votes on the first ballot (492 necessary for a choice), on the second ballot 319, when the nomination was made unanimous, and he was accepted as the leader of the party against the republican candidate, Hon. James A. Garfield; but in the election in Nov. he failed to receive a majority of the electoral votes.

HAND, THE. The genus *homo*, or MAN, takes rank in the classification of mammals as a distinct order, BIMANA, in consequence of man being the only animal possessing *two hands*. At first sight, it might be considered that four-handed animals—the monkeys, apes, and their allies, which are placed by zoologists in the order QUADRUMANA—were superior to those which possess only two hands, but this is far from being the case. None of these four hands are adapted to the variety of actions which the human hand is capable of performing, and they are all, in some degree, required for support and locomotion; so that while in the higher forms of the quadrumana the extremities present an approximation in structure to those of man, in the lower they gradually tend to resemble the ordinary quadrupedal type. "That," says Cuvier, "which constitutes the *hand*, properly so called, is the faculty of opposing the thumb to the other fingers, so as to seize upon the most minute objects—a faculty which is carried to its highest degree of perfection in man, in whom the whole anterior extremity is free, and can be employed in prehension." The peculiar prehensile power of the human hand is chiefly dependent upon the length, power, and mobility of the thumb, which can be brought into exact opposition to the extremities of all the fingers, whether separately or grouped together.

Before describing the hand itself, we must say a few words on the upper extremity generally, of which the hand may be regarded as the essential part.

The general arrangement of the bones of the arm will be readily understood by a reference to fig. 1. The general plan of the osseous framework of the upper and lower limb is very similar. The *humerus* or arm-bone corresponds to the *femur* or thigh-bone; the lower end of the humerus is connected with the two bones of the forearm, the *radius* and the *ulna*, which correspond with the two bones of the leg. Then come the *carpal* bones, the *metacarpal* bones, and the *phalanges*, just as we have *tarsal* bones, *metatarsal* bones, and *phalanges* in the foot.

In fig. 2 (which we copy from Humphry's *Human Foot and Human Hand*,) we have a diagram showing the way in which the bones of the hand are arranged. The carpal bones (3 to 10 in the figure) are eight in number, and are arranged in the wrist in two rows. The first or upper row consists practically of three bones (3, 4, 5), the fourth (6) being regarded as belonging to the class of *sesamoid bones* (q.v.), and the second row of four bones (7, 8, 9, 10); so that, excluding the pisiform bone (6), the carpal and the tarsal bones correspond in number. As we commonly term the palm the *front* of the hand, the thumb becomes conventionally the *outer*, and the little finger the *inner* digit; but according to the rules of comparative anatomy, and in order to compare the hand and foot, we ought to reverse these terms. The outer (3) of the carpal bones of the first row supports (through the intervention of 7 and 8) the bones of the thumb and forefinger (I and II), and constitutes with them the *outer* division of the hand. The inner (5) of the carpal bones bears the little, and the next (the ring) finger (V and IV), and constitutes with them the *inner* division of the hand; while the middle one (4) bears the middle finger (III), and belongs to the *middle* division of the hand. We likewise see from

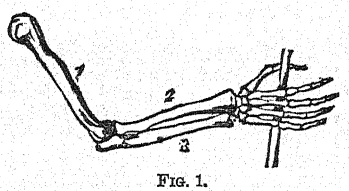


FIG. 1.

1 the humerus; 2, the radius; 3, the ulna. Beyond the distal ends of the radius and ulna come the carpal bones, the metacarpal bones, and the phalanges.

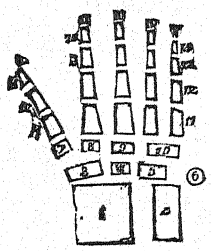

FIG. 2.

Diagram of the bones of the hand, with the ends of the radius and ulna.
1, end of radius; 2, end of ulna; 3, scaphoid; 4, semilunar; 5, cuneiform; 6, pisiform; 7, trapezium; 8, trapezoid; 9, magnum; 10, unciform; 11, 11, metacarpal bones; 12, 12, first row of phalanges; 13, 13, second row; 14, 14, third row; I, thumb; II, forefinger, etc.; V, little finger.

this figure, and likewise from fig. 1, that the two outer bones (3 and 4) are connected with the radius, while the inner bone (5) is connected (indirectly by a thick ligament) with the ulna.

It is unnecessary for us to enter into any anatomical details regarding the individual carpal bones. Collectively, they are so arranged that the carpus presents a dorsal convex surface, upon which the tendons of the extensor muscles of the fingers play, and a palmar concave surface on which the tendons of the flexor muscles lie. The several bones are joined to one another—each bone being united to three or more others—by a large extent of surface, and are girded together by strong ligamentous bands. The wrist is thus as strong as if it had been constructed of one solid piece of bone, while the slight gliding movements which occur between the several bones give it an elasticity which serves to break the shocks that result from falls upon the hand. The uppermost surface of the first row of carpal bones is convex, and this convex surface is received into a wide cup or socket, formed by the lower articular surface of the radius, and by a ligament passing from that bone to the ulna.

The metacarpal bones and the phalanges require no special description. Like the great-toe, the thumb has only two phalanges, while each of the other digits has three.

We shall now notice the various movements of which the hand is capable. They may be divided into (1) the different directions in which the hand collectively can be moved; and (2) the movements of which the hand itself, without reference to the arm, is capable.

The *scapula* or shoulder-blade, with which the principal arm-bone articulates, is itself movable to a very considerable extent on the surface of the ribs on which it rests. Again, the socket in which the nearly spherical head of the *humerus* or arm-bone lies is very shallow—not unlike the cup in the well-known toy *cup-and-ball*—and the arrangements of the shoulder-joint generally are such as to permit so great a variety, and so extensive a range of movements, that we are able to apply the hand to every part of the body. This freedom of motion is due in a great degree to the clavicles or collar-bones,

which, by steadying the shoulder-blades, and keeping the shoulders apart, afford a fixed point for the various muscles which we employ in raising the arms, in folding them over the chest, in the act of hugging, etc. The movement at the next junction of bones, the elbow-joint, is very different from that at the shoulder. The latter is termed, from its construction, a ball-and-socket joint, and admits of motion in all directions, within definite limits; while the elbow is a hinge-joint, and merely admits of bending and straightening, or, in other words, of motion in one plane. We have next to consider a class of movements of the forearm and hand, to which there is nothing analogous (at least to any material extent) in the leg. The movements in question are called "pronation and supination." In *pronation* (derived from *pronus*, with the face downwards), we turn the palm of the hand downwards, as in picking up any substance from the table; in *supination* (derived from *supinus*, with the face upwards), we turn the palm upwards, as for the purpose of receiving anything that may be placed in it.

These movements of pronation and supination are so important to the usefulness of the hand, that we must notice the three muscles by which they are chiefly effected. One of the three muscles passes from a projecting process on the inner side of the arm-bone, at its lower end, to the outer edge of the middle of the radius. Its contraction causes the radius to roll over, or in front of, the ulna. It thus pronates the hand, and is called a *pronator* muscle. Another muscle passes from a projecting process on the other side of the arm-bone to the inner edge of the radius near its upper part. It runs therefore in an opposite direction to the former muscle, and produces an opposite effect, rolling the radius and the hand back into the position of supination. Hence it is called a *supinator* muscle. The third is a very powerful muscle, termed the *biceps* (q. v.), which not only bends the elbow, but from the mode in which its tendon is inserted into the inner side of the radius, "also rotates the radius so as to supinate the hand; and it gives great power to that movement. When we turn a screw, or drive a gimlet, or draw a cork, we always employ the *supinating* movement of the hand for the purpose; and all screws, gimlets, and implements of the like kind are made to turn in a manner suited to that movement of the right hand; because mechanicians have observed that we have more power to supinate the hand than to pronate it." Supination can only be performed to its full extent by man, and even in man it is not the natural or habitual position; monkeys can partially effect the movement, and in most of the lower animals the part corresponding anatomically to the hand is constantly in a state of pronation.

The movements of which the hand itself, without reference to the arm, are capable, are very numerous, and in this respect differ considerably from the corresponding movements of the foot. Thus we can bend the fingers down upon the palm, or we can extend them beyond the straight line; we can separate them from one another to a considerable extent, and we can close them with considerable force. The wrist and hand are bent forwards or flexed upon the forearm by three muscles which pass downwards from the inner condyle or expanded end of the humerus, and are termed the *radial flexor*, the *ulnar flexor*, and the *long palmar* muscles. The first two of these muscles are inserted into wrist-bones on the radial and ulnar sides respectively, while the third expands into a fan-like *fascia* or membrane in the palm of the hand, and thus serves both to support the skin of the palm and to protect the nerves and vessels which lie below it. Beneath the palmar fascia lie two sets of *flexor* muscles of the fingers, and they present so beautiful a mechanical arrangement as to merit special notice.

The *superficial* or *perforated flexor* muscle passes down the front of the forearm and divides into four tendons, which become apparent after the removal of the palmar fascia, and are inserted into the second phalanges of the fingers, each tendon splitting at its termination, to give passage to the similar tendons of the *deep* or *perforating flexor* muscle, which passes from the upper part of the ulna to be inserted into the last phalanx of each finger. These *flexor* muscles are antagonized by the *common extensor* muscle of the fingers, which, like the flexors, divides into four tendons, one for each finger. Besides these, there is a special *extensor* of the index-finger, a series of muscles forming the ball of the thumb, which move that organ in almost every direction, and various small slips giving lateral and other movements to the fingers.

It is sufficient to observe that the hand is very richly supplied with blood-vessels and nerves, without entering into any anatomical details on these points. There is no part of the body where the sense of touch is so acute as at the tips of the fingers; but we shall defer to the article TOUCH, ORGANS AND SENSE OF, the consideration of the special arrangements which make this part of the hand peculiarly important in relation to our knowledge of external objects.

Our notice of the comparative anatomy of the foot (q. v.) renders it unnecessary to trace the modifications presented in the lower animals by the bones corresponding to those of the human hand; as the carpal and metacarpal bones with their phalanges undergo adaptations of form to meet the individual wants of the animal, very much in the same manner as the tarsal and metatarsal bones and their phalanges. Thus, the reader will readily see that the so-called knee of the horse, for example, is the carpus, and he will have no difficulty in tracing the metacarpal bones and phalanges. See the articles BROKEN KNEES and HORSE; and Humphry, *On the Human Foot and Human Hand.*

HAND, a co. in s.e. Dakotah, oraganized after 1870; 1,000 sq.m.; very little settled. The streams are affluents of the Missouri and the Dakotah.

HANDÉL, GEORGE FREDERICK, one of the greatest of musical composers and musicians, though a native of Germany, spent so large a portion of his life in England, where he composed his greatest works, that Britain may almost claim him as her own. He was born at Halle, Upper Saxony, Feb. 23, 1685. He manifested in infancy an extraordinary passion for music, and at the age of seven, having accompanied his father on a visit to the duke of Saxe-Weissenfels, he found his way to an organ, where he was heard by the duke, who remonstrated with his father against further opposition to a genius of so decided a character. He was now placed under a music-teacher, Zachau, where he remained until he was 13, composing every week cantatas for the church-service, and learning all instruments, especially the organ. In 1698 he was sent to Berlin, where the elector of Brandenburg was so impressed with his talents, that he wished to send him to Italy. As his father would not accept this offer, he returned to Halle, whence, on the death of his father, he went to Hamburg in 1703. Here he played a violin in the orchestra of the opera. He was soon its director, and composed his first opera, *Almira*, which was rapidly followed by *Nero* and *Florinda*. His violent temper involved him in a quarrel with a brother-composer, which resulted in a duel; the sword of his adversary was stopped by a button or a music score. He next visited Italy. In Florence, he composed *Rodrigo*, 1707. His *Agrippina*, composed in Venice, had a run of thirty nights. At Rome, he was received at cardinal Ottoboni's, where he heard Corelli, and beat him with his own violin, for not playing to suit him in his *Il Trionfo del Tempo*. In 1710 he returned to Germany, where he was appointed chapel-master to the elector of Hanover, afterwards George I. At the close of the same year he went to England, where he was patronized by queen Anne and the nobility. He composed *Rinaldo, Pastor Fido, Theseus*, and in 1715, *Amadis da Gaula*, in which Nicolini and Valentini first sung in England. In 1718 he undertook the direction of the duke of Chandos's chapel at Cannons, where he wrote *Acis and Galatea, Esther*, the first English oratorio, and numerous concertos, anthems, fugues, etc. A royal academy of music for the cultivation of the opera, was formed in 1720, and, after some competition, was placed under Handel's management. This undertaking, and other opera speculations, in which Handel was engaged, proved very unsuccessful. Handel lost £10,000, and was compelled to retire to Aix-la-Chapelle on account of his health. The oratorio *Deborah* was composed in 1733, and was followed by *Alexander's Feast, Saul, Israel in Egypt*, and (1740) *L'Allégro e Penseroso*. In the end of 1741 he went to Dublin, where his *Messiah*; composed in that year, was produced for charitable purposes. He remained in Dublin about nine months, and received a generous support. From this time success attended all his undertakings. On his return to London, he composed his *Samson;* and the *Messiah* was performed for the benefit of the foundling hospital. It was repeated annually for the same purpose, and from 1749 to 1777 brought to that charity £10,300. Handel became blind, but he still composed, and played on the organ, being led to his seat, and forward to receive the plaudits of the audience. He assisted at the performance of one of his oratorios on April 6, and he died as he wished, on Good Friday, April 13, 1759, "in hopes," he said, "of meeting his good God, his sweet Lord and Savior, on the day of his resurrection." Among his works, which are in the queen's library, are 50 operas—8 German, 26 Italian, 16 English; 20 oratorios, a great quantity of church-music, cantatas, songs, and instrumental pieces. He was a wonderful musician, and his compositions are often full of grandeur and sublimity. His operas are seldom performed, but his oratorios hold the same place in music that in the English drama is accorded to the plays of Shakespeare; and the Handel festivals, lasting several days, are the grandest musical exhibitions of our times. See Chrysander's *Georg Friedrich Handel* (1858–67).

HAND-FASTING, the ancient term for betrothment, now disused.

HAND-GLASSES are very useful implements of gardening, for the protection of tender plants. They are of various kinds, some of them simple bells of glass, with a knob at top, for convenience of lifting them, chiefly used for covering cuttings in the greenhouse or stove, until they *strike* or send forth roots; whilst others consist of metal frames—zinc, lead, iron, or copper—filled up with panes of glass, and sometimes of a size large enough to be used for covering tree-pæonies, acacias, and other tender shrubs.

HANDICAPPING is the term used in various games and sports to denote the placing of competitors, good, bad, and indifferent, on such a footing that all shall have, as nearly as possible, an equal chance of winning. Thus, in horse-racing, when the speed of one horse has been ascertained to be greatly superior to that of another, the swifter of the two, in a handicap race, is made to carry extra weight to an amount that shall be deemed sufficient to reduce its speed to a level with that of its antagonist. Where the public performances of a horse have been exceptionally good, and when both speed and endurance are found to be of an unusually high character, the penalty inflicted in all future handicaps is very great, amounting sometimes to a weight several stones above that of very inferior competitors. The *beau idéal* of a handicap would thus be one in

which the merits of the animals should be so nicely discriminated, and the weights so accurately adjusted, that all the competitors should pass the winning-post at the same time, and thus run a "dead-heat." This is, of course, impossible in practice, but it is nevertheless the ideal at which the handicapper must aim; and the nearer he approaches to it, the more perfect is his work. In racing, no jockey with his saddle, etc., must weigh less than five stone seven pounds, but the maximum is left in the hands of the handicapper, who apportions to each horse a weight corresponding to its public performance, age, and sex. No appeal is allowed from his decision, nor can he be called upon to give the reasons that may have actuated him in allocating weights. Vested with such arbitrary power, he should be a person of sound judgment, unquestionable integrity, and thorough experience. His usual mode of constructing a handicap is to select the best and the worst horse entered for a race, placing such a weight upon the former as he supposes shall bring it down to a level with the latter's minimum of five stone seven pounds. He then proceeds to adjust the weights of the intermediate horses according to their varied merits.

When the handicaps have been published, no alteration can take place in the relative weights of the horses entered, unless one of these should prove a winner during the time intervening between the issue of the handicap and the period of its decision; in which case, extra weight, varying from three pounds and upwards, may have to be carried by the winning horse, as a penalty for his intermediate victory. Each jockey, with his saddle, etc., is weighed prior to starting, the exact extra weight to be carried being made up by lead strips let into the saddle-flaps. He is also weighed *after* the race, to prevent the possibility of his having carried either more or less than his proper weight; a precaution, moreover, that is rigorously observed after every kind of race, whether handicap or otherwise.

Though principally pertaining to horse-racing, handicapping is resorted to in many other sports. In pigeon-shooting from traps, the shooter stands, as a rule, 21 yards from the traps, that being the distance usually allowed to average performers. The more skilful the shooter, the further back has he to stand from the traps; the distance allowed by an acknowledged "crack" shot to his inferiors ranging from 1 to 10 or even 15 yards. In games such as chess and draughts, certain "men" are allowed to the inferior player; in billiards, the better of two allows his antagonist a certain number of "points," so as to equalize or handicap their respective games; at cricket, an eleven, such as the eleven of all England, will sometimes play against twenty-two others; the competition being at times very close. In swimming and in pedestrianism, the inferior competitors are allowed a certain "law," or start; in yachting, the vessel of greater tonnage is handicapped with lesser ones, by allowing them extra time for the performance of the race. For instance, a 50 and a 30 ton yacht start for a race, the former allowing the latter, say, five minutes. They *start together*, and the heavier yacht reaches home, say, three minutes ahead of the lighter; in that case, the lighter yacht's handicap of five minutes gives her the race by two minutes, though she was last to reach home. The principle of handicapping is the same, whether applied to field-sports or home amusements; it is the art of endeavoring to equalize, by certain penalties, the good, bad, and indifferent.

HANDLEY, GEORGE, 1752–1793; a native of England who came to Georgia and served in the patriot army in the revolutionary war. He was governor of Georgia and held a number of less important offices.

HANDS, IMPOSITION OF, a ceremony which has been employed both in ancient and modern religious use as symbolizing the conferring of certain interior, and, generally speaking, spiritual gifts. In the consecration of Aaron and his sons, they are directed to lay their hands upon the heads of the victims which were to be offered in sacrifice (Ex. xxix. 10, 15, 19). Moses set Joshua apart as the leader of the people by "laying his hands upon his head" (Num. xxvii. 23). Our Lord is entreated to heal the ruler's daughter (Matt. ix. 18) by the same ceremony. This is the rite which he himself adopts in blessing the little children (Matt. xix. 15). The gift of the Holy Ghost was imparted by the same ceremony (Acts viii. 17), and the ministers placed by the apostles in the newly founded churches were similarly installed (1 Tim. iv. 14). In the early church, the rite of imposition of hands was employed in the receiving of catechumens and the reconciliation of penitents. From its use in confirmation, that rite is commonly designated by the fathers under the name of imposition of hands. In the ancient church, this rite existed in two forms: the actual laying on of hands, which was called *chirothesia;* and the extending the hand over or towards the person, which was styled *chirotonia.* In the Roman Catholic church, the former is retained as an essential part of the sacraments of confirmation and holy orders; the latter is employed in the administration of the priestly absolution. Both forms are familiarly used in blessing. In the mass, also, previous to the consecration of the elements of bread and wine, the priest extends his hands over them, repeating at the same time the preparatory prayer of blessing. See Wetser's *Kirchen-Lexicon,* vol. iv. 853. The rite of imposition of hands is used both by the Episcopalian and Presbyterian churches in the ordination of ministers. It also forms part of the ceremony of confirmation in the Anglican and in the Lutheran church. See Palmer's *Antiquities of the English Ritual;* Keeling's *Liturgiæ Britannicæ.*

HANDSEL, sometimes used to denote earnest-money, or part-payment, by way of binding a bargain. In Scotland it popularly signifies a first transaction in trade, as, for example, the first sale effected in the day or week; and is likewise employed to signify a present in the nature of a new year's gift on the first Monday in the year—hence called handsel Monday.

HAND-TREE, *Cheirostemon platanoides*, a large tree of the natural order *stereuliaceæ*, which receives its name from the peculiar appearance of its flowers. These have no corolla, but a large 5-lobed and angular colored calyx—bright red within—from which project the five stamens, united by their filaments into a column, and separating and curving at the summit, where they bear the anthers, so as to have some resemblance to a hand or claw. It is not merely this, however, which makes the tree an object of interest, but the circumstance that it is an object of superstitious veneration to the Mexicans; a single tree near Toluca, which is mentioned in the earliest histories, being asserted by them to be the only one in the world, and their eager gathering of its flowers always preventing its multiplication by seed. It was not till 1801 that cuttings were obtained from it for the botanic garden of Mexico, where the young plants have since produced seed abundantly. The tree has also been found in great abundance in Guatemala. It is a lofty tree with a thick trunk, a habit similar to that of a plane, and broad maple-like leaves.

HAND-WRITING, in law, is proved by calling a witness who either saw the individual write the identical words, or who by correspondence, or by having previously at other times seen the same person write other papers, can swear that he believes the paper is the hand-writing of the individual to whom it is attributed. Sometimes, where no direct evidence can be had, engravers and others accustomed to compare the niceties of hand-writing are allowed to give their evidence, or rather state their belief as to the writing; but this kind of evidence is looked upon with great suspicion, and is much discountenanced. In cases where a jury are called upon to determine a disputed question of hand-writing, they are now allowed in England to form their own opinion by comparing the disputed writing with other writings admitted to be by the same party. This could not be done before 1854, but it is done now in both civil and criminal cases. In Scotland, a jury may also be allowed to judge of the hand-writing in this way in any case. In some countries—as, for example, in Scotland—a will, if written in the testator's hand-writing, is admitted to be genuine without the attestation of witnesses, being then called a holograph (q.v.) instrument; but there is no such privilege in England or Ireland, as all wills, by whomsoever written, must be attested by witnesses.

HANG-CHOW-FOO, the capital of the province of Che-keang, in China, on the left bank of the Tsien-tang, where that river disembogues into the bay of Hang-chow-foo, is situated at the commencement of the grand canal, in lat. 30° 18′ n., long. 120° 15′ east. It is about 150 m. s.e. of Nankin. Hang-chow-foo is the most magnificent city of China—a Chinese proverb makes it a heaven upon earth. It was the capital of the empire during the rule of the Mongols, when it was visited by the celebrated Marco Polo early in the 14th century. There are ten gates through its lofty walls, which are 20 m. in circumference, but there are more inhabitants without the *enciente* than within. The population is estimated by Dr. Macgowan at 800,000. The streets, which are of greater width than is usual in Chinese cities, are well paved, and in some directions lined for miles with elegant shops and extensive warehouses. The terminal ramifications of the grand canal are spanned by countless elegant bridges. Hang-chow-foo is celebrated for its silk manufactures, and its embroidery excels that of any part of China. Mulberry-trees occupy every vacant spot within and without the walls. No city in China, unless it be that of Suchau, possesses wealth to compare with that of this remarkable place, which, moreover, is the most literary and most religious part of the empire. Colleges and temples, *literati* and priests, abound and flourish in Hang-chow-foo. The imperial library in the palace of Kienlung, and the literary institutions, appear, however, to be going to decay, and could not at any period have had much educational influence. One cause of the celebrity of the city is found in the beauty of its environs. The tower of the thundering winds, although in ruins, is still an imposing edifice; while monumental gateways, light airy bridges, and temples of the size of villages, render the natural beauties of the city highly picturesque. One of the temples possesses 500 images of the Io-han (Buddhist saints), of the size of life, richly covered with gold. Nothing can exceed the beauty of the valleys opening into the lake, richly adorned as they are with trees, chiefly the camphor and tallow trees, and the arbor vitæ. From a remote period, these scenes have been the resort of pilgrims, and every spot is hallowed by some legendary incident. At one place there is an image of Buddha, cut out of the solid rock, measuring 48 ft. from shoulder to shoulder. The nose is 7 ft. long, and the other parts are of a proportional size; it is gilt over like wooden and clay images of the same personage. The protruding rocks are profusely carved with religious inscriptions and images of mythological characters. The n.e. section of Hang-chow-foo is called the Tartar city, being exclusively devoted to the Mantchu garrison or military colony. It is separated from the Chinese city by a low wall. About 25 m. below the city is Kanpoo, once a mart of considerable importance, the port of Hang-chow-foo, when that city was the metropolis of China, described by Marco Polo as an extremely

flourishing place; fluvial changes have rendered it inaccessible to any but small, flat-bottomed vessels. Chapoo, about 50 m. distant, situated on the n. of the bay, is now the port of Hang-chow-foo. Chapoo has also a Tartar city; it communicates by branches of the grand canal with Hang-chow-foo and Shanghai. It is the port to which Chinese trade with Japan is restricted. Hang-chow-foo suffered considerably at the hands of the rebel Tae-pings (q.v.), by whom it was captured.

The configuration of the bay of Hang-chow-foo and the embouchure of the Tsien-tang river, which empties into it near the provincial capital, favors the formation of the tidal phenomenon designated an eagre or bore. See BORE. Dr. Macgowan, the first European who has witnessed this magnificent spectacle, has published an account of it in the *Proceedings of the Asiatic Society of Hong-kong*. As the tide rushes into the mouth of the river, it becomes elevated to a lofty wave, which attains its greatest magnitude opposite the city of Hang-chow-foo. Generally, there is nothing remarkable in its aspect, except at the period of the vernal and autumnal equinoxes, the maximum being at the latter season. As the hour of flood-tide approaches, crowds gather in the streets running at right angles with the river, but at safe distances; boatmen stop lading and unlading their vessels, and put out into the middle of the stream. The center of the river teems with craft. Loud shouting from the fleet announces the appearance of the flood, which seems like a glistening white cable stretched athwart the bay as far down as the eye can reach. Its noise, compared by native poets to that of thunder, speedily drowns that of the boatmen; and as it advances with prodigious velocity, it assumes the appearance of an alabaster wall, or rather of an advancing cataract 4 or 5 m. across, and about 30 ft. high. As the foaming wall of water dashes impetuously onward, one trembles for the safety of the floating multitude. They cease shouting, and devote their energies to the steadying of the prows of their vessels toward the advancing wave, which threatens to submerge everything afloat; but they all vault as it were to the summit with perfect safety. This grand and exciting scene is but of a moment's duration; the wave passes up the river in an instant, but from this point with gradually decreasing force, volume, and velocity, disappearing entirely a few miles above the city. From ebb to flood tide, the change is almost instantaneous; a slight flood continues after the passage of the wave, but it soon begins to ebb. Within the historic period, numerous changes have been effected by the action of this wave, the most noted being the removal of a rocky islet from the center of the river opposite Hang-chow-foo. Chinese ingenuity has been long exerted, with imperfect success, in preserving the alluvial plain from the wasting action of the eagre. The history of the dikes that have been successively erected, of failures and disasters, found in the local annals, show that, like the Yellow river, this part of the Tsien-tang has been a constant source of anxiety and expense to the government, costing about $130,000 per annum.

HANGED, DRAWN, AND **QUARTERED,** the description of the capital sentence on a traitor, which consisted of drawing him on a hurdle to the place of execution, and after hanging him, dividing the body into quarters. This punishment was substituted by the stat. 54 Geo. III. c. 146, for the ancient more barbarous sentence of disemboweling alive, but the crown has power to reduce the sentence to simple beheading. See also HANGING.

HANGING is the mode by which capital punishment is carried out in the United Kingdom. In England, formerly, in atrocious cases, it was usual for the court to direct a murderer to be hung upon a gibbet in chains near the place where the crime was committed—also at a later period to order the body to be dissected—and the execution to take place on the next day but one after the sentence was passed. But these useless severities were abolished by the stat. 6 and 7 Will. IV. c. 30.

The mode of punishing by hanging was first adopted in England in 1241, when Maurice, a nobleman's son, was hanged for piracy. Other more barbarous modes of inflicting death were long in use, being prescribed by statute, but have been abolished, and hanging has long been the ordinary, because the most humane, mode of executing capital punishment. In treason, hanging is part of the statutory punishment, coupled with mangling the body, though the crown may change the sentence into simple beheading, except in the case of women, who are only hanged, in deference to their sex. Formerly, in Scotland, on the other hand, a capital sentence pronounced south of the Firth of Forth could not be executed within less than 30 days; and if pronounced north of the Firth, within less than 40 days after it was pronounced. But now, in both cases, the day of execution must not be less than 15, nor more than 21 days, south of the Firth; nor less than 20, nor more than 27 days, if north of the Firth, after sentence passed. Until recently, the hanging or execution took place in public. See EXECUTION.

The cause of death in hanging is complex. The compression of the windpipe by the cord, the obstruction of the return of venous blood from the head, and of the flow of arterial blood to the brain, the stretching or tearing of the nervous structures of the neck, and in some instances dislocation or fracture of the vertebræ, may concur in the production of the fatal effect, which, though attended with violent struggles in some cases, is probably as nearly instantaneous as possible. The subject, in its relations to medical jurisprudence, will be more fully considered under the title STRANGULATION.

HANGING GARDENS. The hanging gardens of Babylon were anciently reckoned among the wonders of the world. Their construction is variously ascribed to queen Semiramis, and to Nebuchadnezzar—seven centuries later, but still more than five centuries B.C.—who is said to have made them for the gratification of his Median queen, Amytis, because the Babylonian plain seemed dreary to her in comparison with the varied and romantic scenery of her native land. Diodorus and Strabo have given particular descriptions of them; and although it is remarkable that they are not mentioned by Herodotus, whilst Quintius Curtius speaks of them as "fabulous wonders of the Greeks"—an opinion which some of the learned in modern times have adopted, denying their very existence—yet the probability seems to be in favor of the general accuracy of the descriptions, and even that the ruins of this celebrated structure are to be recognized among the mounds which mark the site of Babylon. See BABYLON. The hanging gardens are said to have formed a square, with an area of nearly four acres; but rising in terraces curiously constructed with stone pillars, across which were placed stones, covered with reeds and bitumen, and again with bricks united by cement; above these, sheets of lead, to prevent moisture from flowing down, and finally a sufficient layer of earth; the summit being elevated three hundred feet above the base, so that at a distance the whole presented the appearance of a pyramidal wooded hill. There was a large reservoir at the summit, which was filled with water by pumping from the Euphrates, for the irrigation of the gardens, and the supply of their numerous fountains. Fountains and banqueting rooms were distributed throughout the numerous terraces; groves and avenues of trees, as well as parterres of flowers, diversified the scene; whilst the view of the city and neighborhood was extensive and magnificent.

HANIFAH, called also ABU-HANIFAH, 699–767; an Arabian, and founder of the Hanifites, the oldest of the sects of Mohammedans considered orthodox. Because he opposed the caliph's persecution of the people of Mogul he was forced to poison himself. He was the author of a commentary on the Koran.

HANKOW', in lat. about 30° 30′ n., and long. 114° e., a port of China, at the junction of the Han river with the Yang-tze-kiang, 600 miles from its mouth. It consists of three cities, the principal being Wu-chang-foo, on one side of the Han river, and Han-yang-foo on the opposite side. Strictly speaking, Hankow is a suburb of the former. It was destroyed during the Tae-ping rebellion, but has since been rebuilt, and has a population of from 500,000 to 1,000,000. English and American steamers ply regularly and frequently between Hankow and Shanghai. Vessels of large size can reach the city; the river is navigable 360 miles higher up, to the city of Ichang. Powerful flat-bottomed steamers are requisite for navigating this part of the Yang-tze-kiang, the current running at from seven to eight knots per hour. The principal export is tea. Other native products exported are silk, oil, tallow, tobacco, and wax. The chief imports are cotton piece-goods, woolens, metals, Straits and Japanese produce. The value of the exports, in 1870, was £4,434,129; and in 1871, £5,578,258; of the imports, in 1870, £5,938,314; and in 1871, £6,756,631. In 1875 the exports and imports were respectively valued at £5,652,094 and £4,853,810.

HANLEY, a t. of Staffordshire, England, in the district known as *the potteries*, and included in the parliamentary borough of Stoke-upon-Trent (q.v.). It is two miles and a half from Newcastle-under-Lyme, about one m. from Stoke, and one m. from the North Staffordshire railway station and canal offices. The principal portion of the town has an elevated site. The streets are not very regular, but they are wide and well paved; and many of the houses are well built. There are several commodious market-places. There are numerous places of worship of the church of England and other denominations. Among the public institutions is an infirmary.—Contiguous to Hanley is SHELTON, which may be regarded as forming with it one town. The manufacture of earthenware and china is the principal employment of the inhabitants of both. At Shelton is a villa called Etruria, erected by Josiah Wedgwood, remarkable for the Etruscan vases with which it is ornamented, imitations of ancient vases found in Italy, and the study of which was of great use to him in his endeavors to improve the manufacture of earthenware. The pop. of Hanley in '71 was 39,976.

HANNIBAL, a city in Missouri, U. S., on the w. bank of the Mississipi, 132 miles above St. Louis. It is the terminus of the Hannibal and St. Joseph and other railways, and has steamboat communication with various towns on the Mississippi. It has a large trade in pork, tobacco, hemp, and grain, with mills, foundries and machine-shops. It has a college. Pop. '70, 10,125.

HANNIBAL (*ante*), a city in Marion co., Mo., on the Mississippi, about 150 m. above St. Louis, the terminus of the Hannibal and St. Joseph, and the Missouri, Kansas and Texas railroads; has communication with St. Louis, by the river, and by the St. Louis, Keokuk and Northwestern, and with the e. by the Wabash railroad; pop. about 15,000. The inhabitants are extensively engaged in manufacturing, and there is a large trade in lumber and produce. Here is the seat of Hannibal college (Meth. Epis. South), founded in 1868.

HANNIBAL (*the gift of Baal*) was a common name among the Carthaginians, the list of those famed in history extending to fourteen or fifteen. But the greatest of all the

Hannibals was the famous son of Hamilcar Barca. He was b. in 247 B.C. When he was nine years old, he accompanied his father on his Spanish expedition; and before starting, swore that oath of eternal hatred to the Roman name, which he kept so faithfully throughout his whole life. After the death of Hamilcar, he was employed by Hasdrubal, his brother-in-law, in most of the military operations which he undertook. Such was the esteem in which he was held by the soldiers, and such a reputation for bravery and strategic skill had he gained, that when Hasdrubal was assassinated, the army with one voice elected him commander-in-chief, an appointment which the authorities at Carthage at once ratified. Hannibal, at this time in his 29th year, undertook the command with ready zeal, for he longed to realize the legacy left him by his father, and to strike a death-blow at his country's rival by attacking her on her own soil. But before he entered on a task of such magnitude, he deemed it prudent to complete the subjugation of Spain, and accordingly spent two years in contests with some tribes hitherto independent of Carthage. Saguntum, a city in alliance with Rome, was attacked by him on the ground that its inhabitants were making aggressions on the Torboletes, subjects of Carthage. After a siege of eight months, the city was taken; and the Romans, after an embassy had unsuccessfully demanded the surrender of the general who had thus wantonly violated the treaty, declared war in 218 B.C. Having taken measures for the defense of Africa and Spain during his absence, he started from New Carthage in 218 B.C., with 90,000 foot, and 12,000 horse. This force was very much thinned by his contests with the tribes between the Iberus and the Pyrenees, by the necessity of leaving Hanno with 11,000 men to keep them in subjection, by desertion in the passage of the Pyrenees, and by his sending home a portion of his Spanish troops. His object in this last act was to inspire the soldiers with thorough confidence in themselves and their general. From the Pyrenees he marched to the Rhone without opposition, since Scipio was at Massilia (Marseille), four days' march from the point where Hannibal crossed the river in the face of the Celtic hordes who sided with the Romans. His next great difficulty was the passage of the Alps, which he effected in fifteen days, in spite of the attacks of the mountain tribes, the snows, storms, and other difficulties. Much discussion has taken place among learned men whether Hannibal crossed the Cottian Alps by the pass of Mont Genevre (or Cenis), or the Graian Alps by the pass of Little St. Bernard. For the former route, Michelet, Thierry, and most French writers argue; and for the latter, with better reasons, Niebuhr, Arnold, Mommsen, etc. After allowing his army (now about 26,000 strong) some time to recruit in the rich villages of the friendly Insubrians, he first subdued the Taurini, a tribe hostile to the Insubrians, and took their chief city after a siege of three days; and thus forced into alliance with him all the Ligurian and Celtic tribes on the upper course of the Po. Scipio, having returned from Massilia, took the command of the army in the north of Italy, and first met Hannibal on the plain near the river Ticinus. The Romans were entirely routed; and Scipio, who was severely wounded, retreated across the Po. The armies again met at the Trebia, with a like result, though the Romans, who had received reinforcements, were much more numerous. These battles were fought in 218 B.C. Having wintered in the neighborhood of the Po, and levied additional troops among the Gauls, most of whom were now his friends, Hannibal started southward so soon as spring permitted, marching through Liguria and the swamps of the Arno. In this difficult route, immense numbers of his beasts of burden and horses perished, and he himself lost the sight of one eye. He next inflicted a severe defeat, near lake Thrasymene, on the consul Flaminius: thousands perished by the sword, including the consul, and thousands in the lake, while 15,000 were taken captive, Hannibal losing only 1500. After this victory, he crossed the Apennines to Picenum and Apulia, and thence re-crossed to the fertile Campania, which he ravaged. Thither Fabius was sent with an army to oppose him, but no general engagement took place, the consul endeavoring to lead Hannibal into snares, which he succeeded in doing; but the wily African extricated his army by a stratagem, and returned to Apulia. He wintered at Cannæ, and in June, or according to others, in Aug. (2d) of 216 B.C., almost annihilated a Roman army of 90,000 men under Terentius Varro and Æmilius Paulus, in the battle, which was fought a little below the town. About 50,000 are said to have fallen, including Æmilius Paulus, and a host of Roman knights, senators, and other distinguished persons. Here Hannibal committed, perhaps, the greatest military error of his life, in not marching direct to Rome; but it is supposed that he refrained, in order to allow the tribes of Italy to declare in his favor. Many in the south of Italy did attach themselves to his interests, but not in such numbers as he had anticipated. After some delay he marched on Neapolis (Naples), which he did not succeed in taking, but the gates of Capua were opened to him, and here he wintered. The enervating effect which the luxury of Capua is said to have had on his army has been greatly overdrawn, but his residence there forms, in one point of view, the turning-point in the war, which from this time became more of a desultory kind. Hannibal's great purpose was to arm the Italian nations against Rome, and so to crush her power by means of her own subjects; the Romans, on the contrary, henceforth avoided coming to a pitched battle with the Carthaginians, but sought rather to keep the tribes in awe, and harass Hannibal and his lieutenants by small armies in different parts of the country. Hannibal traversed Italy in all directions, surprised the Roman generals, defeated

their armies, captured their towns, such as Casilinum, Arpi, Tarentum, Metapontum, Thurii, Locri, and many others; he defeated Centenius near Capua; Cn. Fulvius at Herdonea; Fulvius Flaccus on the Anio; Crispinus and Marcellus in Lucania; and the besieging army before Locri: in all these cases the armies were almost annihilated. The defeat of Hasdrubal, his brother, at the river Metaurus, and the loss of his army, compelled Hannibal to confine himself to the mountainous peninsula of Brutium, where for four years he resisted all the efforts of the Romans to dislodge him. At length, after having maintained himself in Italy for upwards of fifteen years, he was recalled to Africa, to defend his country against Scipio; but notwithstanding his utmost exertions, and the bravery of his veteran troops, he was defeated by Scipio, near Zama, with a loss of 20,000 men. Peace was concluded in the following year (201 B.C.).

Hannibal's darling scheme had in the meantime been baffled, but his hatred to Rome was not diminished, and accordingly he set himself with all his zeal to make preparations for a still more deadly struggle at some future day. He turned his attention, in the first place, to political reforms, and some constitutional changes which were loudly called for, by which he placed the finances on a better footing. But his enemies accused him to the Romans of stirring up Antiochus III. of Syria to make war on them; and when ambasssadors came to Carthage, Hannibal fled to the court of Antiochus at Ephesus. In the war which followed, he took no conspicuous part, but the king bitterly regretted afterwards that he did not take the advice of Hannibal to carry war into Italy. When peace was concluded, the surrender of Hannibal was one of the conditions; but foreseeing such a result, he fled to Prusias, king of Bithynia, for whom he gained a naval victory over Eumenes, king of Pergamus. He was at length demanded by the Romans; and seeing no hope of escape, he took poison, which he always carried with him for such an emergency.

Among ancient authorities, the reader may consult, with great profit, Polybius, Dion Cassius, Plutarch, and Appian; and of the moderns, Arnold, Niebuhr, Mommsen, Ihne, and the other historians of Rome. For military operations specially, see Vandoucourt, *Histoire des Campagnes d'Annibal en Italie.* Hannibal's life has been recently made the subject of a tragedy by prof. Nichol of Glasgow.

HANNO (perhaps the father or the son of that Hamilcar who fell at Himera in 480 B.C.) is famed for a voyage of discovery which he made along the w. coast of Africa, to found Libyo-Phenician towns. His expedition is said to have consisted of 60 ships and 30,000 men and women. One city was built not far from the strait of Gibraltar, and others along the coast reaching to cape Bojador. He went south as far probably as Sierra Leone. On his return to Carthage, he inscribed an account of his voyage on a tablet, and placed it in the temple of Kronos (Saturn), or, according to others, of Juno. It seems to have been written in the Punic language; the version of it which remains is only a Greek translation. The *Periplus* has been published on the continent by Gelenius, Boecler and Müller, and Berkel, and with an English translation by Falconer (Lond. 1797). Great discussions have taken place among the learned as to the *time* when Hanno's voyage was made (the best authorities favoring the period of about 570 B.C.); as to *the* Hanno out of all the many Hannos of history; and as to the facts stated in the *Periplus;* but on these we cannot enter. Some recent writers find evidence in it of the existence of the *gorilla* in those ancient days. For a full discussion of the subject, consult Dodwell's Dissertation (in Hudson's *Geographi Minores*); Bougainville's Essay (*Mém de l'Acad. des Inscript.* xxvi. p. 10, and xxviii. p. 260); also Falconer, in his edition already referred to.

HANNO, called the great, d. 202 B.C.; a Carthaginian general. In the first Punic war he captured Hecatompylus. With Hamilcar he was victorious over the mercenaries, and when war was over he was the leader of the aristocratic party, and opposed Hamilcar and his sons.

HANOVER, a co. in e. central Virginia, between Chickahominy, Pamunkey and North Anna rivers, intersected by the Chesapeake and Ohio, and the Richmond, Fredericksburg and Potomac railroads; 400 sq.m.; pop. '70, 16,455—8,562 colored. It has a hilly surface, with much forest land; productions: corn, oats, and tobacco. Co. seat, Hanover Court House.

HANOVER, formerly a kingdom of northern Germany, but since 1866 incorporated with Prussia. (The following description refers chiefly to the state of things before the union; for more recent information, see PRUSSIA). Hanover extends from 51° 18′ to 53° 52′ n. lat., and from 6° 43′ to 11° 35′ e. long. It may be divided into three distinct districts, viz: 1. The eastern, which consists of the duchy of Bremen cum Hadeln, a section of the duchy of Lauenberg, the duchy of Werden, the principalities of Lüneburg, Kalenberg, and Hildesheim, and the countships of Hoya and Diepholz; 2. The western (separated from the former by the duchy of Aldenburg) comprises the duchy of Aremberg-Meppen, the principalities of Osnabrück and East Friesland with the Harlingerlands, the lower countships of Lingen and Bentheim, and the circle of Emsbühren, which formerly belonged to the see of Munster; 3. The southern, which is separated from the other Hanoverian territories by Brunswick, and comprises the principalities of Grubenhagen and Göttingen, together with the districts of Elbingerode and Ilfeld. Hanover is bounded n. by the German ocean and the river Elbe, e. by Mecklenburg and

Prussian Saxony, s. chiefly by Westphalia and Hesse Cassel, and w. by Holland. The following table shows the divisions, or landrosteien, of Hanover, with their respective areas and populations:

Landrosteien, or Provinces.	S. Area in Sq. Miles.	Population in Dec., 1858.	Chief Towns.	Population.
Hanover	2300.13	354,763	Hanover, with subs.	61,852
Hildesheim	1708.56	360,801	Hildesheim	16,300
Lüneburg	4293.45	358,701	Lüneburg	12,600
Stade	2595.60	288,975	Stade	6,000
Osnabrück	2388.33	258,797	Osnabrück	12,800
East Friesland, or Aurich	1144.08	189,068	Aurich	4,792
Clausthal, and Mines of Goslar	241.92	32,946	Clausthal	14,000

In 1858 the area was accordingly a little over 14,670 sq.m.; pop. 1,844,976. Area of the Prussian province of Hanover, 14,800 sq.m.; pop. '75, 2,018,868.

Physical Character, etc.—The general physical character of Hanover is that of an extended plain with slight undulations, but in the s. the country is mountainous, embracing a considerable part of the Harz, together with the lesser heights of the Eichsfeld, Sollinger, Süntel, Deister-Oster, and Hildesheimer-Wald. From the base of these hills to the sea-coast, the land is one vast plain, only interrupted at certain points by low ranges of hilly ground. The mountains, which abound in minerals, are covered with dense woods, and the valleys lying between them are fertile and well adapted to agriculture, but beyond these valleys the country is traversed from e. to w. by a sandy tract from 50 to 80 m. in width, known as the Lüneburg heath, in which the inhabitants with difficulty gain a scanty subsistence by rearing sheep and keeping bees. Great marshes or peat-moors cover the n. and n.w. districts, but these have in some parts been so successfully drained that they yield good pasture, although the soil generally is unproductive, comprising some of the poorest districts of Germany. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dikes, the land being in many parts below the ordinary level of the sea. Along the banks of the rivers there are fertile districts, even in the n. of the country.

The principal rivers are, the Elbe, which forms 120 m. of the n.e. boundary-line; the Weser, on whose affluent the Leine, the capital of Hanover, is situated; the Aller, the Ems, and the Vechte, which all fall into the German ocean. There are numerous small lakes in Hanover. The principal canals are those between Lingen and Meppen, Aurich and Emden, and the Bremen canal, between the Hamme and the Swinge, which serves to drain the moors, and to transport the turf and peat which they yield.

Climate.—The climate is moist near the ocean, and fogs and heavy winds are frequent; in the s. it is dry and colder; and in some parts of the country marsh fevers prevail, although the general character of the climate in Hanover may be characterized as healthy. The mean annual temperature is 46°5; winter 28°7; and summer 64°5. Extremes are rare. The average annual fall of rain is 23 in.

Soil, Products.—The soil is generally of inferior quality, although it varies considerably in different districts. Agriculture is in a very backward condition, and notwithstanding some improvements which have been made of late years, large tracts of land, which are well adapted for cultivation, lie waste in every part of the country. The great subdivision of the land, and the consequent absence of capital, are the main causes of this imperfect mode of agriculture. The following proportions are given by Marcard for the distribution of the land in Hanover: Arable, meadow, and garden land, 5,833,000 morgen (the morgen is 0.6310 acre); forests, 2,242,000; waste lands, 6,514,000.

The richest corn-growing districts are Hildesheim, Göttingen, and Kalenberg, and the marsh-lands near the Elbe and Weser; rye is grown for the purpose of making bread, and largely used by the rural population. The turf obtained from the peat-moors in the n. and n.w. districts constitutes the only kind of fuel used in some parts of the country, and is obtained and consumed in very large quantities. Cattle, horses, and geese are extensively reared in East Friesland and the marshlands; and barley and oats are raised in sufficient quantity for exportation.

The Lüneburg and other extensive heaths afford good sheep-walks; and when the heather is in blossom, are resorted to by the keepers of bees, who tend their hives with much care and considerable success. In 1869 there were 213,870 hives, chiefly in the Lüneburg district, yielding honey to the value of £40,000. During the same year, it was estimated that there were in Hanover 212,905 horses (upwards of 4,000 stallions); 863,362 horned cattle; 2,156,920 sheep (of which 244,000 were merinos); 572,366 swine, and 158,203 goats. In East Friesland, large flocks of geese are reared; the flesh of which is salted and exported; while large quantities of butter and cheese are annually exported from the same localities.

The rivers and lakes of Hanover yield an abundance of fish, and there are upwards of 2,500 well-stocked fish-ponds in the kingdom. Salmon is obtained in large quantities in the Weser. The herring-fishery is principally carried on from Emden, whence it is

prosecuted with considerable enterprise, the boats going not unfrequently as far as the coasts of Scotland. The forests on the Harz mountains and their offshoots yield large quantities of wood, chiefly pine and oak, while the valleys grow tobacco and some good fruits. The mineral resources of Hanover are rich and varied, including iron, copper, silver, lead, sulphur, zinc, coal, cobalt, vitriol, alum, arsenic, lime, gypsum, marble, pipe-clay, kaolin, freestone, slate for tiles, salt, obtained from 18 works, etc. In 1875 the annual production of some of the chief minerals were estimated as follows: Iron, 2,682,100 cnt. (1 centner = 100 lbs.); lead, 169,000 cnt.; salt, 1,092,000 cnt.; coal, 2,300,000 cnt. About one-third of the iron and one-fourth of the salt are obtained from the mines of the state, and it is estimated that 35,000 persons are employed in the different mining operations of Hanover.

Commerce, etc.—The trade, which has undergone some augmentation since Hanover joined the German Zollverein (q.v.) in 1854, is still very unimportant and undeveloped notwithstanding the numerous favorable conditions presented by the navigable rivers of the Hanoverian states, their good ports, well-kept high-roads, and extended railways. Besides mining, agriculture, and the rearing of cattle and other animals, the chief branches of industry are sugar-refineries, and the manufacture of tobacco, paper, hemp, thread and linen, leather, bricks, pipes, etc.

The exports consist mainly of mineral products coarse linens and canvas, honey and wax, feathers, wood, wool, horses, cattle, wheat and rye, butter, hops, rape and linseed, oil-cakes, hams, and sausages. The imports comprise English manufactured goods, colonial products, wine and spirits, and silk. Emden is the principal trading port, but the chief sea-trade of the country is effected through Hamburg and Bremen, while Hanover has an extensive commission and transit business with Leipsic and Frankfort-on-the-Main. Besides Emden, Pappenberg, Harburg, Lehe, and Leer, are rising into some note as trading ports. Hanover has good high-roads, and its postal system is well organized. The length of its post and high-roads is estimated at upwards of 3,800 m., and that of the lines of railway in operation (in the year 1875) at 660 miles. The telegraph lines are about 700 m. in extent.

Revenue.—The revenue amounted, according to the budget for 1861–62, to 19,588,322 thalers (the thaler = 2*s.* 10¾*d.*), while the expenditure for the same year was 19,763,941 thalers. The national debt had risen, in 1861, to 46,344,836 thalers, including a debt for railways of 30,623,075 thalers.

Army.—The army numbered nearly 27,000 men. The service was for a period of 7 years, the last year's service, however, being limited to the reserved corps. The principal fortresses are those of Stade, Harburg, and Fort-William, in the harbor of Bremen. Hanover furnished 15,230 men to the German confederation, and had 4 votes in the plenum, or full council of the diet.

Religion, Education, etc.—The population of Hanover, in 1871, was 1,964,527. Of these there were—Protestants, 1,713,711; Roman Catholics, 233,809; different Christian sects, 3,284; Jews, 12,799. Religious matters are under the direction of Lutheran (evangelical) and reformed consistories at Hanover, Stade, Otterndorf, Aurich, Hadeln; the see of Osnabrück, which is held alternately by a Roman Catholic and a secular Protestant bishop; and the Roman Catholic see of Hildesheim. Hanover, like other countries of northern Germany, is amply provided with educational institutions. It has one university at Göttingen, 17 high and 13 lower gymnasia, 5 normal and 21 polytechnic schools, a military academy at Hanover, a "Foundation Padægogium" at Hefeld, schools of surgery and midwifery, of which that at Celle is the most esteemed, schools for the blind, deaf and dumb, and about 3,600 free parish schools, which are in most cases dependent upon the local church party, whether Protestant or Catholic. There are also several good mining and forest schools in different parts of the kingdom.

The poor are provided for partly by voluntary subscription and partly by the proceeds of their own labor in the poor-houses erected for the reception of persons in want. There are partially self-supporting reformatories at Emden and Celle, while Hanover, Hameln, Göttingen, Lüneburg, Emden, and Hildesheim have all their separate houses of detention and poor-houses.

Law.—The administration of the law was presided over by a special ministry. Criminal cases have, since 1848, been tried before sworn juries.

Constitution, Government.—Hanover was a sovereign kingdom from 1814 to 1866. The monarchy was hereditary in the male line, and the administration was conducted by a responsible ministry with two representative chambers, whose concurrence was essential to the exercise of certain prerogatives of the crown. The upper of the two chambers consisted of the princes of the blood-royal; several mediatized princes; and other members of the higher nobility; four members nominated by the king; and fifty other members. Half the number of the elected representatives retired every third year. The lower chamber consisted of 2 of the members of the ministry nominated by the king, 2 deputies appointed by the chamber itself, 38 representatives of towns and boroughs, and 44 members for the country districts. There were, moreover, 7 provincial assemblies, whose concurrence and assent were necessary for the promulgation of laws and the levying of taxes within their several districts.

The highest department of the government was the council of state. The cabinet, which, after 1848, was composed of responsible members, comprised 7 ministers, each

of whom presided over a special department of the administration. The chambers were summoned every 2 years, but the diet or landtag was septennial. The monetary system, and the weights and measures of Hanover, were the same as those adopted by the German Zollverein (q.v.).

People.—The Hanoverians are a mixed race; those inhabiting the north-eastern and central provinces are mostly Saxons, but those on the coast are of Frisic origin; those on the west of the Ems, Dutch; and those in the southern provinces, Thuringians and Franconians. Platt-Deutsch, or low German, is commonly spoken in all the rural districts excepting those bordering upon the Netherlands, in which Dutch is the ordinary form of speech; while high German, as in every other part of Germany, is the language of the educated and higher classes.

History.—The country at present included in the kingdom of Hanover was occupied in remote ages by Saxon tribes, which, after a long-continued struggle under their leader Witikind, submitted to the dominion of Charlemagne, and embraced Christianity. Hanover continued to form part of the Frankish empire until the time of the emperor Ludvig the German, when Ludolf of Meissen incorporated it in the duchy of Saxony. In 951 the emperor Otho I., who had inherited Saxony from his father, Henry I., the hereditary duke, bestowed it on Hermann Billing, on the extinction of whose family in 1106, it passed to Lothaire of Supplinburg. By the marriage of Lothaire with Richenza of Nordheim, new territories were added to the duchy, which passed to the family of the Guelphs through their descendant Gertrude, who married Henry the proud, of Bavaria. Henry the lion, the son of the latter, did much to advance the civilization and commerce of his subjects by conferring rights and privileges upon various towns which had advocated his cause; but when he fell under the ban of the empire, a period of anarchy and confusion succeeded, which at first threatened the ruin of the country. When Henry lost the duchy of Saxony, he retained his hereditary lands of Brunswick and Lüneburg through the special favor of the emperor.

The reformation early found adherents among the burgher and rural populations of Hanover; but as the new doctrines were strongly opposed by many of the chief magistrates and the majority of the nobles, their formal introduction was made the subject of violent altercations between the opposite parties, until the conversion of Ernest I. of Lüneburg in 1535 gave support and stability to the cause of Protestantism.

The line of Brunswick-Lüneburg began with William the younger, who, in the partition which he and his elder brother Henry (the founder of the reigning Brunswick house) made of the dominions of their father, Ernest I., obtained in 1569 the duchies of Lüneburg and Celle (Zell). William died in 1592, leaving seven sons, who, with a view of avoiding the further dismembering of their patrimony, agreed that the eldest should succeed, but that one only of their number should marry. The lot of marriage fell upon the sixth brother, George, who died in 1641, in the reign of his fourth brother, duke Frederick, the last survivor of the family. On the death of Frederick in 1648, Christian Lewis, the eldest son of duke George, succeeded his uncle, and in accordance with the family compact, took, as his portion of the inheritance, Lüneburg, Grubenhagen, Diepholz, and Hoya, with Celle for his residence; while his next brother, George William, obtained Kalenburg and Göttingen, with Hanover for his residence, and thus gave origin to the lines of Celle and Hanover, which were again merged in one after the death of duke George William, third son of duke George, who, dying without male heirs, was succeeded by his kinsman and son-in-law, the elector, George Lewis of Hanover, who ascended the throne of England as George I. (q.v.) on the death of queen Anne in 1714, as the nearest Protestant heir of the deceased sovereign, being son of the electress, Sophia, daughter of Elizabeth, queen of Bohemia, and grand-daughter of James I. of England. Duke George William of Celle deserves notice for his warlike and active administration, and for the part which he took in all the momentous affairs of his age; thus he sent auxiliaries to Venice, to aid the republic against the Turks, cooperated with the duke of Brunswick to reduce his insurgent capital; entered into an alliance with the emperor against France and Sweden; sent an army into Hungary to resist the Turks; and in 1688 lent troops and money to William of Orange against James II. of England.

With George Lewis, king of England, and the second elector of Hanover or Brunswick-Lüneburg, a brighter epoch opened to the Hanoverians, who, on his accession to the throne of England, were relieved from the burden of maintaining the court and ducal household, while the revenues of the crown were thenceforth appropriated solely to the general purposes of the state. Bremen and Werden were obtained in this reign by purchase from Denmark. George II., who succeeded in 1727, showed the same care as his father to spare the revenues of Hanover at the expense of those of England. In his character of elector, he participated in the Austrian war of succession, 1740–48; but in the seven years' war, when Hanover suffered materially from the incursions of the French, he sided with Prussia. This king founded the university of Göttingen in 1745. The first 30 years of the reign of George III. (q.v.), who succeeded on the death of his grandfather in 1760, contributed largely towards the prosperity of Hanover, which, like the other states of northern Germany, profited by the increased English and American trade, for which the Hanoverian ports and rivers formed the regular channels of communication with the rest of Germany. In 1793 Hanoverian troops took part in the

prosecuted with considerable enterprise, the boats going not unfrequently as far as the coasts of Scotland. The forests on the Harz mountains and their offshoots yield large quantities of wood, chiefly pine and oak, while the valleys grow tobacco and some good fruits. The mineral resources of Hanover are rich and varied, including iron, copper, silver, lead, sulphur, zinc, coal, cobalt, vitriol, alum, arsenic, lime, gypsum, marble, pipe-clay, kaolin, freestone, slate for tiles, salt, obtained from 18 works, etc. In 1875 the annual production of some of the chief minerals were estimated as follows: Iron, 2,682,100 cnt. (1 centner = 100 lbs.); lead, 169,000 cnt.; salt, 1,092,000 cnt.; coal, 2,300,000 cnt. About one-third of the iron and one-fourth of the salt are obtained from the mines of the state, and it is estimated that 35,000 persons are employed in the different mining operations of Hanover.

By the marriage of Lothaire with Richenza of Nordheim, new territories were added to the duchy, which passed to the family of the Guelphs through their descendant Gertrude, who married Henry the proud, of Bavaria. Henry the lion, the son of the latter, did much to advance the civilization and commerce of his subjects by conferring rights and privileges upon various towns which had advocated his cause; but when he fell under the ban of the empire, a period of anarchy and confusion succeeded, which at first threatened the ruin of the country. When Henry lost the duchy of Saxony, he retained his hereditary lands of Brunswick and Lüneburg through the special favor of the emperor.

The reformation early found adherents among the burgher and rural populations of Hanover; but as the new doctrines were strongly opposed by many of the chief magistrates and the majority of the nobles, their formal introduction was made the subject of violent altercations between the opposite parties, until the conversion of Ernest I. of Lüneburg in 1535 gave support and stability to the cause of Protestantism.

The line of Brunswick-Lüneburg began with William the younger, who, in the partition which he and his elder brother Henry (the founder of the reigning Brunswick house) made of the dominions of their father, Ernest I., obtained in 1569 the duchies of Lüneburg and Celle (Zell). William died in 1592, leaving seven sons, who, with a view of avoiding the further dismembering of their patrimony, agreed that the eldest should succeed, but that one only of their number should marry. The lot of marriage fell upon the sixth brother, George, who died in 1641, in the reign of his fourth brother, duke Frederick, the last survivor of the family. On the death of Frederick in 1648, Christian Lewis, the eldest son of duke George, succeeded his uncle, and in accordance with the family compact, took, as his portion of the inheritance, Lüneburg, Grubenhagen, Diepholz, and Hoya, with Celle for his residence; while his next brother, George William, obtained Kalenburg and Göttingen, with Hanover for his residence, and thus gave origin to the lines of Celle and Hanover, which were again merged in one after the death of duke George William, third son of duke George, who, dying without male heirs, was succeeded by his kinsman and son-in-law, the elector, George Lewis of Hanover, who ascended the throne of England as George I. (q.v.) on the death of queen Anne in 1714, as the nearest Protestant heir of the deceased sovereign, being son of the electress, Sophia, daughter of Elizabeth, queen of Bohemia, and grand-daughter of James I. of England. Duke George William of Celle deserves notice for his warlike and active administration, and for the part which he took in all the momentous affairs of his age; thus he sent auxiliaries to Venice, to aid the republic against the Turks, cooperated with the duke of Brunswick to reduce his insurgent capital; entered into an alliance with the emperor against France and Sweden; sent an army into Hungary to resist the Turks; and in 1688 lent troops and money to William of Orange against James II. of England.

With George Lewis, king of England, and the second elector of Hanover or Brunswick-Lüneburg, a brighter epoch opened to the Hanoverians, who, on his accession to the throne of England, were relieved from the burden of maintaining the court and ducal household, while the revenues of the crown were thenceforth appropriated solely to the general purposes of the state. Bremen and Werden were obtained in this reign by purchase from Denmark. George II., who succeeded in 1727, showed the same care as his father to spare the revenues of Hanover at the expense of those of England. In his character of elector, he participated in the Austrian war of succession, 1740–48; but in the seven years' war, when Hanover suffered materially from the incursions of the French, he sided with Prussia. This king founded the university of Göttingen in 1745. The first 30 years of the reign of George III. (q.v.), who succeeded on the death of his grandfather in 1760, contributed largely towards the prosperity of Hanover, which, like the other states of northern Germany, profited by the increased English and American trade, for which the Hanoverian ports and rivers formed the regular channels of communication with the rest of Germany. In 1793 Hanoverian troops took part in the

wars against the French republic, but the expenses of their maintenance were defrayed by England; and it was not till 1801, when Prussia, refusing to acknowledge the neutrality of Hanover, threw troops into the electorate, that Hanover suffered from the consequences of the anomalous position in which its relations to England placed it in regard to the other states of Germany. The Prussian troops evacuated Hanover at the close of the same year, in accordance with the treaty entered into between France and England; but the claims and counter-claims which arose from this occupation, gave rise to protracted discussions, which were not finally settled till 1830, when it was stipulated by treaty that Hanover was to pay to Prussia an indemnity of 375,000 thalers. In 1803, when war was renewed between England and France, Napoleon threw an army, under the command of Mortier, into Hanover, and the result of this measure was to compel the Hanoverian government to enter into a convention with the French gen., by which it bound itself to abstain from serving against France during the pending war; to give up fortresses, arms, and horses to the army; to subsidize French troops; and to participate unconditionally in the general costs of the war. A large number of the army, however, having contrived to evade signing these articles of surrender, went over to England, where the men were incorporated into the German legion, which did good service both in the Peninsular war, and in the Belgian campaign of 1815, which terminated in the battle of Waterloo. In 1806 Napoleon, after having ceded Hanover to Prussia, and again withdrawn it, appropriated a portion of the electorate to complete the newly-formed kingdom of Westphalia, which in 1810 received the whole of the Hanoverian territory. Finally, Hanover was united with France, and the n.w. portion divided into the departments of Bouches de l'Elbe, Bouches du Weser, and Leine, while the s.e. portions formed the Westphalian departments of Atter and Harz. After the expulsion of the French, Hanover was elevated to the rank of a kingdom in 1814. In the same year, the prince Regent of England convoked the Hanoverian states to deliberate upon the best manner of consolidating the various independent governments of the different provinces into one systematic whole. In 1816 the duke of Cambridge, the brother of the prince regent, was appointed governor-general of Hanover; and in 1819 a new constitution was granted, in accordance with which the provincial states were retained and enlarged, and two representative chambers associated with them. Very little was done in the time of George IV. towards the amelioration of the administration, and the general disaffection and distrust had risen to the highest pitch, when William IV. ascended the throne. The influence of the French revolution of July (1830) extended to Hanover, and in 1831 disturbances broke out at Osterode and Göttingen. These were speedily put down, but as the national discontent did not abate, the prime minister, count Munster, who had long been obnoxious to the mass of the people, was dismissed, and the duke of Cambridge, who had hitherto acted as governor-general, invested with the title of viceroy, and intrusted with very extensive powers. The duke recommended gradual reforms, but as the popular feeling was decidedly in favor of a thoroughly re-modeled constitution, the states were again convoked; and finally, in 1833, a draft of the proposed constitution, which had been prepared by a commission appointed by the ministry and the states, was laid before William IV., and after it had been considerably modified in England, it received his signature, Sept. 26, 1833, without having been again submitted to the assembly of the states. The death of William IV., in 1837, placed Hanover under the rule of the next male heir, Ernest August, duke of Cumberland. One of the first measures of the new king was to abrogate the constitution of 1833, to which he had from the time of its adoption refused to give his assent and to restore that of 1819.

When the government demanded the oath of allegiance from all persons holding office under the state, seven of the Göttingen professors—viz., Dahlmann, Gervinus, J. Grimm, F. Grimm, Ewald, Albrecht, and W. Weber—refused to take the required oath, in consequence of which all were deprived, without any preliminary investigation, of their chairs, and the three first-named banished from the country.

From this period till 1848, when the success of the French revolution compelled the German rulers to adopt a more liberal policy towards their subjects, the king showed himself resolutely averse to sanction reform. Liberal measures, however, were at length introduced, and the new constitution of 1848 was more liberal than that of 1833. The king, moreover, organized some useful reforms in the internal administration, and effected great improvements in several of the towns.

The chambers of Hanover showed great zeal in the reorganization of Germany, and king Ernest entered into a triple alliance with Prussia and Saxony, to promote the unity of the German nation. Unlike many of his German contemporaries, king Ernest kept the promises which he had made to his people during the revolutionary crisis of 1848-49; and although the nobility made the most pressing appeals to him for the recovery of their ancient privileges, and the overthrow of the constitution, he refused to withdraw his pledge that the country should be governed in accordance with constitutional principles; and such confidence was placed in his word, that, notwithstanding his avowed opinions, his death, in 1851, was regarded as a serious blow to the cause of reform, for his son and successor, George V., was known to hold very extreme views in regard to the kingly power and the claims of the aristocracy. The early measures of the new king were not calculated to allay the fears entertained of his policy; but the decisive declaration of the

assembly of the states that they were desirous of seeing the reforms completed which had been begun by the late king, and their vote of want of confidence in the new cabinet, prevented any marked retrogressive movement on the part of the ministry, and in 1854 Hanover joined the Zollverein. In 1855 the constitution underwent various modifications in accordance with the demands of the federal diet, by which it was made to approximate more closely to that of 1840. Although the changes were unpopular, they met with no energetic opposition. After the war of 1866 Hanover became a province of Prussia. See GERMANY.

HANOVER, a t. in Jefferson co., Ind., near the Ohio river, 6 m. w.s.w. of Madison; pop. of township, 1399. It is the seat of Hanover (Presbyterian) college, founded in 1833.

HANOVER, a t. in New Hampshire, United States, pleasantly situated on the e. bank of the Connecticut river, 52 m. n.w. from Concord. It is the seat of Dartmouth college, founded by lord Dartmouth for the education of the Indian youth, and a medical college. Pop. of township ('70), 2,085.

HANOVER (Ger. *Hanno'ver*), formerly capital of the kingdom, now chief t. of the province of Hanover, is situated on a plain lying on both banks of the Leine—which is crossed by ten bridges, and is navigable hence to the ocean—about 100 m. s.s.w. of Hamburg. It consists of the old town, and the suburbs Glocksee and Linden, and with these inclusive, it had, in 1871, a pop. of 104,248. The older parts of the city are mean and unattractive, but since 1837, when by the accession of Ernest-Augustus, duke of Cumberland, to the throne, it became the residence of the sovereign, Hanover has undergone very extensive alterations and improvements. In the Waterloo Platz, with its column surmounted by a figure of Victory, are the fine new barracks and arsenal. Besides these the most interesting buildings are the stately town-hall in the market-place, founded in 1439, with an adjacent public library of 40,000 volumes; the royal library, with its 150,000 volumes and 2,000 MSS., its incunabula, archives, and valuable state papers; the theater, one of the largest in Germany; the king's palace; the museum, with good natural-history collections; a gallery of pictures, etc.; and the royal state palace, built on the site of a monastery of Minorites in 1632, which deserves notice for the magnificence of its internal decorations, and for the number and value of the objects of ancient and modern art which it contains; its fine gallery of paintings; its chapel, in which are preserved numerous relics and antiques, many of which were brought from Palestine by Henry the Lion in 1172; and an altar-piece by L. Cranach. Among the charitable institutions of H. are the orphan asylum, school for the blind, infirmaries, hospitals, and poor-houses, the latter of which are principally supported by private subscription. Hanover is well provided with educational institutions, the most noteworthy of which are the Georgianum, a collegiate school for the sons of noblemen; a lyceum, and a gymnasium. The city has also polytechnic, normal, and medical schools, and 25 free public schools. Hanover was the first place in Germany that was lighted with gas (in 1826). The discovery of a rich bed of asphalt in the neighborhood of the town has been the means of giving the streets better side-pavements than most other German towns possess, while the recent improvements that have been effected in the old system of sewers, which dates from the 16th c., render the drainage particularly good. Hanover has gained pleasant walks and pleasure-rounds by the leveling and planting of the ramparts, while in the immediate vicinity of the town lie the royal palaces of Herrenhausen and Montbrillant, whose beautiful grounds and gardens are freely opened to the public.

Since Hanover became a center of the North German railway system, its manufactures have greatly increased in importance. Amongst the foremost are the manufactures of cotton, wax-cloth, machinery, locomotives; also gold, silver, and bronze wares, chemicals, leather, and tobacco. The trade of the place has also rapidly developed of late years.

HANOVER COURT-HOUSE, Battle of. See Chickahominy.

HANSARD, a well-known name in connection with the printing of the British parliamentary records. The first of the family was Luke Hansard, who was born in 1752 at Norwich, and coming to London, worked for some years as compositor in the office of Hughes, the printer to the house of commons; and in 1800 succeeded Hughes as sole proprietor of the business, which is still carried on by his family. Competition and other causes have led to a division of the parliamentary printing, but the Messrs. Hansard still print the bills before parliament, the reports of committees, and some of the accounts.

The name of Hansard is connected with an important question of parliamentary privilege. The case was briefly as follows: A bookseller named Stockdale brought an action for libel against the Messrs. Hansard, the libel consisting of statements in the parliamentary reports which the latter had printed, and lord chief-justice Denman decided in favor of Stockdale. The house of commons complained of a breach of privilege, and another action was raised in the court of queen's bench, but, as before, the plea of *the orders and privileges of the house* was overruled. After a third action had been brought, with

a similar result, an act of parliament was passed, directing that any proceedings against persons for publication of papers printed by order of either house of parliament are to be stayed by the courts of law, upon delivery of a certificate and affidavit that such publication is by order of either house.

The Hansards are, however, most widely known by the reports of the debates in parliament, which are published by them and bear their name. When charges of inconsistency are made in parliament, they are usually verified by a quotation from *Hansard*, the accuracy of which is seldom or never disputed. An opinion, in consequence, widely prevails that the Messrs. Hansard retain a corps of parliamentary shorthand writers in their service, from whose reports the debates printed in their work are prepared. This popular impression is entirely erroneous. The speeches printed in *Hansard* are taken in the gross from the London morning newspapers. They are usually sent to the peers or members by whom they are spoken for revision and correction, and many important alterations, expurgations, and additions are made in the speeches thus revised, when a speaker has been led away by the heat of debate, or has, on the other hand, failed to say all that was in his mind when he rose. The convenience, however, of possessing some record more or less authentic of parliamentary proceedings has led the executive government to take a certain number of copies of *Hansard* for distribution among the public offices and departments. Many peers and members of parliament, foreign governments, and public libraries, also subscribe to this work, which is issued at a certain fixed price, which the Messrs. Hansard guarantee, at the commencement of each session, shall not be exceeded.

HANSEATIC LEAGUE, THE, or THE HANSA, was a trade-union established in the 13th c. by certain cities of Northern Germany for their mutual safety, and for the protection of their trade, which at that period was exposed to the rapacity of rulers, and the lawless attacks of marauders on land and pirates at sea; yet, notwithstanding obstacles such as these, and the heavy imposts levied on the German traders by their princes, several towns of Northern Germany, as, for instance, Hamburg, Lübeck, and Bremen, had acquired some commercial importance as early as the 11th century. The fame of the rich cargoes that found their way into their factories had given rise to swarms of pirates, who infested the mouths of the Elbe and the outlets to the Baltic; and the necessity which the neighboring ports felt of protecting themselves effectually from such troublesome enemies led, in 1219, to the settlement of a compact between Hamburg, Ditmarsh, and Hadeln, to protect the course of the river and the adjacent sea. This agreement was followed two years later by a treaty of mutual aid and defense between Hamburg and Lübeck, which was joined, in 1247, by the town of Brunswick; and thus was formed the German league, or Hansa, the name of which indicated, in the Platt-deutsch of the traders, a bond or compact for mutual aid. The progress of the league was so rapid that, before the year 1260, when the first diet met at Lübeck, which was the central point of the whole association, it had its regularly organized government, with a fixed system of finance and administration.

The entire league, which at one period numbered 85 towns, and included every city of importance between Holland and Livonia, was divided into four classes or circles: 1. The Vandal or Wendic cities of the Baltic; 2. The towns of Westphalia, the Rhineland, and the Netherlands; 3. Those of Saxony and Brandenburg; 4. Those of Prussia and Livonia. The capitals of the respective circles were Lübeck, Cologne, Brunswick, and Danzig.

The cities composing the league were represented by deputies at the general diet, which met every three years, generally at Lübeck, which was considered as the capital of the league, to discuss and settle the current business of the league, and held an extraordinary meeting every ten years, to renew the various unions which constituted the great Hansa. The edicts of the diet were communicated to the masters of the great circles, who remitted them to the several guilds within their respective jurisdictions.

Four large foreign factories were established at London (1250), Bruges (1252), Novogorod (1272), and Bergen (1278); and besides these and the ordinary members, various cities were connected by treaties of limited alliance with the league; as, for instance, Amsterdam, Antwerp, Bordeaux, Barcelona, Cadiz, Dordrecht, Leghorn, Lisbon, Marseilles, Messina, Naples, Ostend, Rotterdam, Rouen, Seville, St. Malo.

The Hanseatic league was the first systematic trade-union known in the history of European nations, and the high political influence which it rapidly attained was due to its development of sounder principles of trade than any that had hitherto been put into practice; while in the earlier periods of its existence it exerted a beneficial action on the advance of civilization, which can scarcely be overrated. Its professed object was to protect the commerce of its members by land and by sea, to defend and extend its commercial relations with and among foreigners, and as far as possible to exclude all other competitors in trade, and firmly to maintain, and, if possible, extend, all the rights and immunities that had been granted by various rulers to the corporation. For the promotion of these ends, the league kept ships and armed men in its pay, the charge of whose maintenance was defrayed by a regular system of taxation, and by the funds obtained by the money-fines which the diet levied for infringements of its laws. In its factories, only unmarried clerks and serving-men were employed, and an almost monas-

tic discipline was enforced; but the by-laws of the league prescribed a system of daily sports and light occupations for the recreation of the men, while sensible regulations for their comfort and cleanliness, and for the celebration of festivals at certain fixed times of the year, bear evidence of the sound sense that influenced the mode of government of the Hansa, and which was further shown by the injunction to the masters of factories to avoid everything that could hurt the prejudices of the foreigners among whom they were placed, and to conform in all things lawful to the habits of the country.

For many years the Hanseatic league was the undisputed mistress of the Baltic and German ocean. It created new centers of trade and civilization in numerous parts of northern Europe, and contributed to the expansion of agriculture and other industrial arts, by opening new channels of communication by means of the canals and roads with which it connected together the members of its association. The greatest powers dreaded its hostility and sought its alliance, and many of the powerful sovereigns of the middle ages were indebted to it for the most substantial benefits.

In England, since the time of king Ethelred, German traders had enjoyed the same privileges as native-born Englishmen. Henry II. took the Cologne merchants, together with the house which they occupied on the Thames, specially under his protection, allowing to them and their successors the privilege of exporting goods free of duty, and selling their Rhenish wines for the same price at which French wines were then sold in London; and in 1261 these privileges were extended by Henry III. to all the Germans in London who had a share in the Hanseatic factory, or *Aula Teutonicorum*, which was long known to Londoners as the "steelyard." In 1338 the Hansards gained the goodwill of Edward III. by supplying him with the money necessary to redeem the regalia and coronation jewels of his queen, which he had pledged to Cologne money-lenders, and by allowing him to draw upon their houses for large sums with which to defray the cost of his French wars. Their relations to other sovereigns at that period were equally significant of their power, for they defeated kings Eric and Hakon of Norway, and king Waldemar III. of Denmark, in 1348, deposed Magnus of Sweden, and bestowed his crown upon duke Albert of Mecklenburg; and in 1428 equipped a fleet of 248 ships, carrying 12,000 soldiers, against Eric of Denmark.

With the 15th c. the league reached at once its culminating point and its decline, for in proportion as the seas and roads were better protected by the states to which they belonged, and rulers learned to comprehend the commercial advantages of their dominions, its supremacy declined; while the discovery of America, and of a new sea-route to India, gave an entirely different direction to the trade of Europe. The Hansa had, moreover, arrogated to itself, in the course of time, presumed rights of imposing the greater and lesser ban, and exercising acts of sovereignty and judicial power, which were incompatible with the supremacy of the rulers in whose states they were enforced, and hence the league was necessarily brought into frequent hostile collision with the local authorities. Thus, in accordance with their system of exclusive policy, the Hansards refused to grant to merchants trading in foreign parts the same privileges in the Hanseatic cities which they themselves had enjoyed for centuries in England, Russia, and Scandinavia, and hence arose dissensions, which not unfrequently ended in a fierce maritime warfare. By way of retaliation for the pertinacity with which the league refused to grant to the English the same immunities which had been accorded to traders of other nations, parliament required that Germans should pay the tax on wool and wine, which was exacted from all other foreigners in the English markets; and although the Hansards strongly resisted, they were at length condemned by the courts, in 1469, to pay a fine of £13,500; and they would probably have lost all they possessed in England, if their cause had not been advocated by Edward IV., who had more than once been indebted to them for money and aid, and who in 1474 secured for them, by a clause in the treaty of Utrecht, a restitution of nearly all their former rights in England. In 1598 their obstinate pertinacity in insisting upon the maintenance of their old prerogatives, notwithstanding the altered condition of the times, drew upon them the anger of queen Elizabeth, who dispatched a fleet under Drake and Norris to seize upon the ships of the Hansa, of which 61 were captured, while she banished the Hansards from their factory in London. These measures had the desired effect of compelling the league to receive English traders on equal conditions, and thenceforward the Hansards were permitted to occupy the steelyard, as in olden times. The Hansa had, however, outlived its date, and at the diet held at Lübeck, in 1630, the majority of the cities formally renounced their alliance. Hamburg, Lübeck, Bremen, and, for a short time, Danzig, remained faithful to their ancient compact, and continued to form an association of free republics, that existed unchanged till 1810, when the first three were incorporated in the French empire. These, in 1813, combined with Frankfort-on-the-Main to form a union. Frankfort became Prussian in 1866; whereas at a convention in July, 1870, the powers and privileges of the three free towns were re-established and reorganized, and under the empire they still retain their local self-government. See Sartorius, *Gesch. des hanseatischen Bundes* (1802–08); Barthold, *Gesch. der deutschen Hansa* (1854); *Hansische Geschichtsblätter* (1871–77).

HANSEN, Peter Andreas, 1795–1874; a Danish astronomer; when young apprenticed to a watchmaker; afterwards employed by Schumacher, professor of

astronomy at Copenhagen, to assist in the measurement of an arc of meridian in Holstein. This led to his appointment as assistant to Schumacher, at the observatory of Altona. Hansen's reputation as a mathematician had by this time become generally known, and in 1825 he was selected to succeed professor Encke as director of the observatory of Seeberg, near Gotha. There he remained for the rest of his life, devoting his talents to the development of the highest branches of mathematical astronomy, with an originality of conception which was acknowledged by the English royal astronomical society on two occasions, by the award of their gold medal for his researches in physical astronomy and his lunar tables. His *Tables de la Lune* appeared in 1857, published at the expense of the British government, which awarded him a prize of £1000; they have been adopted for use in the calculations of the *Nautical Almanac*. In addition to this important volume containing the full details of the formulæ explanatory of his lunar theory, Hansen was the author of a large number of miscellaneous papers, principally relating to the orbits of comets and planets or to perturbational astronomy. In one of these he was the first to point out that Encke's value of the horizontal equatorial solar parallax required to be increased to reconcile the lunar theory with modern observations—an opinion which was subsequently confirmed by Le Verrier from his planetary researches and by the observations of Mars and the transit of Venus of 1874. Hansen was a foreign member of the royal society, and an associate of the royal astronomical society.

HAN'SI, a t. of the district of Hissar, in the province of the Punjab, lies 89 m. to the n.w. of Delhi, in lat. 29° 6′ n., and long. 76° 3′ e. It is watered by a branch of the Delhi canal, made in 1356 by Feroz Toghluk, and cleared in 1825 by the British government. This work, besides its domestic and agricultural uses, is available for navigation. The pop. of the town according to the latest census (1868) was 13,563.

HANSON, a co. in s.e. Dakotah traversed by the Dakotah river; 432 sq.m.; formed since 1870. The soil is fertile. Co. seat, Rockport.

HANSTEEN, CHRISTOPH, a Norwegian astronomer, was b. at Christiania, Sept. 26, 1784. At first intended for the legal profession, he subsequently devoted himself entirely to the study of mathematical science. In 1814 he was appointed to the chair of mathematics in the university of Christiania, and there, in 1819, published his celebrated work on magnetism, which was afterwards translated into German under the title of *Untersuchungen über den Magnetismus der Erde*, and produced a great sensation, especially in England, so much so, that in almost all the voyages of discovery since undertaken, magnetic observations have been made in conformity to his directions. In 1821 he discovered the "law of magnetic force." See MAGNETISM. After having visited London, Paris, Hamburg, Berlin, and different parts of his native country, he resolved to undertake a journey to Siberia, for the purpose of continuing his magnetic observations, which he accomplished from 1828 to 1830, and returned to Europe with a large collection of facts, which were of much service in aiding to dispel the obscurity which enveloped and still partly envelops this subject. On his return to Christiania, he prevailed upon the government to erect an observatory, fitted also for magnetic observations. Besides occupying his chair in the university, Hansteen was professor of mathematics in the school of artillery, superintended the triangulation of Norway, and helped in the reorganization of the national system of weights and measures. He died April 15, 1873. He published lectures on astronomy, a work on mechanics, another on geometry, and several memoirs, of which the greater part are inserted in the *Magazin for Naturvidenskaberne*.

HANTS, a co. in central Nova Scotia on Mines basin; 1175 sq.m.; pop. '72, 21,301. It has a varied surface of mountains, hills, and valleys. Gypsum abounds in great quantities. Chief town, Windsor.

HANUMÂN, or HANÛMÂN (the nominative of the Sanskrit base *hanumat* or *hanûmat*, literally meaning "having a jaw," but understood to imply "having a broken jaw"), is the name of a fabulous monkey, who plays a great rôle in the legendary history of the second or classical period of Hindu mythology. He is represented there as the strenuous friend and ally of Vishnu, when the latter, in his incarnation as Râma, made his expedition to Ceylon, in order to recover his wife Sitâ, carried off by the giant Râvana. See VISHNU. In the war between Râma and Râvana, Hanumân, on one occasion, is related to have bridged over the ocean between the continent of India and Ceylon with rocks of a prodigious size, which he and his friend threw into the sea; on another, to have set Lankâ on fire, by means of igniting his tail, previously dipped into combustible matter; and when, to restore to life his friends slain in battle by the armies of Râvana, he flew to the Himalaya, where he intended to gather the magical herbs required for his purpose, he grew impatient at not finding them quickly, and tore off the whole peak of the mountain, which he then carried to Lankâ, the capital of Ceylon. Such and many other extraordinary feats are related of this "chieftain of the monkey tribe," especially in the great poem *Râmâyana*, which is devoted to the history of Vishnu in his descent on earth as Râma, and in many of its chapters dwells with particular predilection on Hanumat the monkey. Of his origin and his first darings, the older version of this epos gives us the following account: His mother was an apsaras or nymph,

Punjikasthalá, who, through some curse, however, was born as the daughter of a monkey, and under the name of *Anjaná*, became the wife of the monkey *Kesarin*. Possessing the power of assuming whatever shape she pleased, she once transformed herself into a human being, and walked in splendid attire on the top of a mountain. There *Váyu*, the god of wind, caught sight of her, and became bewildered with love. The result of his stormy courtship, though purely ideal, as he at least explained it to her, was the child Hanumat. The later version of the *Rámáyana* adds to this story a prefatory incident to justify, as it were, the liberty which the god took with the wife of Kesarin, by making him act under the promise of a rishi or saint. When a child, Hanumân, while once lying on the lap of his mother, saw the sun rise, and thinking it was a fruit, conceived the desire of taking it. Up he started, therefore, into the air; but Indra, angry at his presumption, hurled him down with his fiery thunderbolt to the top of the mountain, where in his fall he broke his left jaw.

The numerous pictures and sculptures by which this singular Hindu deity is represented, refer to these and similar episodes of his history. He appears either in a fighting posture, armed with disk, sword, or trident, and trampling on some vanquished foe; or he is carrying the rocks with which he bridged over the sea; or he is in the attitude of a worshiper—which means of Vishnu. Frequently his figure is single; sometimes it is connected with that of garuda, the sacred bird-vehicle of Vishnu; and it is never missing in those groups which emblematically represent the principal facts of Râma's life. Those not very familiar with the meaning of Hindu idols, will never fail to recognize him by his prodigious tail.

That Hanumân is the type of the monkeys worshiped by a certain class of Hindus, requires no further remark, nor will it be necessary to say that this monkey-worship, to which so early a writer as Megasthenes bears testimony when he speaks of the numerous monkeys coming to the town Latage—probably in the north of India—and being fed there daily, has its origin in the devotion to the memory of Hanumân, that great friend of Vishnu. The foundation of the myth is probably an historical one. There is no reason to doubt tradition when it tells us that a hero—it calls him Ramâ—carried Brahmanic institutions from the north of India to Ceylon, and we may believe it also when it couples with this event a cause which transformed this expedition into a war between the Brahmanic population of India and that of Ceylon. Nor is it improbable that Ramâ, on his march to the south, formed alliances, and that his allies, on account of their barbarous condition, were compared by his followers to monkeys. There, however, all that may be real in the myth of Hanumân seems to end, for its other ingredients are either purely legendary, or represent phenomena of a physical kind. When Ramâ ceased to be the human hero, and became an incarnation of Vishnu, it followed, as a necessary consequence, that the history of all the circumstances connected with this change also became in part imaginary, and in part influenced by the character which belonged to the god. It is the latter influence which is especially perceivable in the origin ascribed to Hanumân. Vishnu is in the Vedas a deity representing attributes of the sun, and the legends of the birth of his ally are such as would originate in phenomena connected with sunrise. To this the names ascribed to his mother seem to point; for the apsarasas "were originally personifications of the vapours which are attracted by the sun, and form into mists or clouds" (see Goldstücker's *Sanskrit Dictionary* under the word "apsaras"); and *anjaná*, among other meanings, signifies night.

HANWAY, JONAS, 1712–86; an English traveler. In 1743 he became a partner with Mr. Dingley, a merchant in St. Petersburg, and in this way had his attention turned to the trade between Russia and Persia, in which latter country he traveled considerably, meeting with many misfortunes. The latter part of his life was for the most part spent in London, and his leisure was devoted to the advocacy and support of useful enterprises. He is popularly remembered as the first Englishman to carry an umbrella in his native country; this he persisted in using in spite of all the efforts of the hackney coachman to hoot or hustle him into conformity. He wrote with some effect against the custom of giving vails, or gratuities to servants; and in his *Journey from Portsmouth to Kingston* he attacked the habit of tea-drinking, which, however, found an able and ardent defender in Dr. Johnson. In 1757 he took an active part in founding the Marine society, the object of which was to fit out poor boys and men for the navy; he was one of the originators of the Magdalen hospital; it was due to his continued efforts that the act of George III. was passed for the better treatment of the parish infants; and in 1785 he took up the lamentable case of those little chimney-sweeps whose dangerous occupation is now a thing of the past. The method of solitary confinement for prisoners found in him one of its earliest advocates, and in various other ways he sought to improve the chances of the criminal population.

HAPLOMI. See ESOCIDÆ, MALACOPTERYGII, and PIKE, (*ante*).

HAP'SBURG, or **HABSBURG**, HOUSE OF, of which the imperial family of Austria are the representatives, derived its name from the castle of Habsburg, or Habichtsburg (Hawk's castle), on the right bank of the Aar, in the Swiss canton of Aargau. The castle was built in the 11th c. by Werner, bishop of Strasburg, grandson of Gunthrun the rich, count of Alsace and Breisgau, who, according to the Austrian chroniclers, was descended from Ethico I., duke of Alemannia and Alsace in the 7th century. Werner

delivered the castle to his brother Kanzeline, whose nephew, Werner II., was the first who assumed the title of count of Hapsburg. Albrecht or Albert III., the great-grandson of Werner II., assumed the title of Landgraf of upper Alsace, or Sundgau. This prince possessed a great part of Swabia, Alsace, and the Aargau, to which his son, Rudolf I., added Lauffenburg. On his death in 1232, his sons, Albert IV. and Rudolf II., divided their father's possessions—Rudolf becoming the founder of the Hapsburg-Lauffenburg line. This branch became extinct in 1408 in Germany, but is still represented in England by the Fielding family. The whole possessions of Rudolf's lineage reverted to the Austrian line in 1415. Albert IV. laid the foundation of the future greatness of the house of Hapsburg. He left three sons, the eldest of whom, Rudolf III. (Rudolf I. of Austria), succeeded him, and by appropriating the provinces which, as emperor, he had wrested from Ottocar of Bohemia—viz., upper and lower Austria, Styria, Carinthia, and Carniola—greatly increased the power of his family. His son, Albrecht or Albert I. (q.v.), succeeded in 1291 to the family possessions. The further history of the house of Hapsburg may be traced in that of Austria (q.v.). It may be noted here that Ernest, surnamed the iron, one of the sons of Leopold II., and founder of the Styrian line, married Cymburga, daughter of Ziemovitz, duke of Masovia (now province of Warsaw), and niece of Uladislas Jagellon, king of Poland, celebrated in Austrian history not only for her beauty and accomplishments, but also for her great strength of body, of which latter quality some historians give remarkable instances. From her are said to be derived the thick lips which are a characteristic feature of the Austrian family.

Compare prince Lieknowski, *Geschichte des Hauses Habsburg* (2 vols. Wien, 1836–37), also Coxe's *House of Austria.*

HARAFORA, or ALFOOROO, a tribe of savages in the island of Celebes and also in Papua or New Guinea, somewhat resembling the Malays, but having crisp instead of straight hair. They clothe themselves with the inner bark of trees made flexible by pounding. The fighting men are armed with shields and cleavers. One of their barbarous customs prescribes that a young man shall not marry until he has cut off a human head; the order of importance being—first, a man's head, then that of a woman, and lastly, a child's; but the greatest trophy is the head of a white man. The result of this butchery is that in some places the skulls accumulated through this custom far outnumber the people living. They have some traditions of a god, and of a religion derived probably from the Mohammedans. They live in the most primitive huts, and have no considerable village.

HÁRA-KIRI (see HARRI-KARI, *ante*). From *hara,* belly, and *kiri,* to cut. The Japanese method of suicide for men only, women never using this method. With the abolition of the custom of wearing two swords, hara-kiri is rapidly falling into desuetude, and is practiced only in rare cases. The object of hara kiri was to sever the large artery in front of the spine, and thus secure speedy death.

HARALD I. (surnamed HAARFAGER, or beautiful-haired), king of Norway (863–930), was a descendant of the ancient race of the Ynglings in Sweden, and the son of Halfdan Svarte, a powerful jarl in Norway, who is noted as the earliest lawgiver of his country. According to the popular saga, Harald was induced to attempt the subjugation of the whole of Norway, through his love to a high-born maiden, named Gyda, who declared that she would not be his wife until he was sole king of Norway; and he swore that he would neither cut nor comb his hair till he had subdued all the land to his sway—an oath which he kept. After many years' contest with his brother jarls, he finally reduced the whole of the country from Finmarken to the Naze of Norway; and after defeating the last general confederacy of the independent Norwegian chieftains in a naval battle at Hafursfjord, the present Stavengerfjord, he remained sole ruler of the land (872). Previously to his reign, Norway, like the other Scandinavian countries, had been divided into numerous independent districts or tribes, governed by their several kings. Harald, however, replaced all these rulers by jarls of his own, under whom were placed herser or bailiffs, to whom was committed the charge of seeing that the tax which was imposed over all the land was faithfully paid. Harald's severity compelled the deposed rulers to seek other homes; and his reign is memorable for the many new settlements which were made by these exiles. Thus, the Orkneys were settled by the fugitive Ejnar, the son of the king's friend, Rognvald, jarl of More; while another son, Ganger Rolf, who had incurred Harald's anger by repeated acts of piracy, sailed with his followers in 876 to France, where he founded the Norman power. Other exiled Norwegian jarls or kings colonized the Hebrides, Shetland, and Faröe islands, and Iceland, whence they continued their customary sea-roving and plunders until these islands, with the exception of Iceland, were subdued by Harald. Although a barbarian, he ruled with a sound policy in advance of his age, and by his firmness succeeded in suppressing for the time the private warfare and sea-piracy which had prevailed in Norway before his reign; but the dissensions of his numerous sons checked all the good that might have resulted from his measures. To restore concord in his family, he divided his dominions among his children, reserving only the supreme power to himself. He died in 933 at Trondheim, which he had made his capital, and was succeeded by his son, Eric Blodöxa, or the Bloodaxe, to whom he had three years before resigned the government.

HARALD III. (surnamed HAARDRAADE, or double beard), king of Norway (1047–67), was the son of Sigurd, chief of Stingarige, and a descendant of Harald I. In his boyhood, he was present at the battle of Sticklestad, in which his brother Olaf, surnamed the saint, king of Norway, was slain; and he afterwards sought an asylum at the court of his relative, Jaroslav, duke of Russia, whose daughter he sought in marriage. The rejection of his suit, however, again drove him forth, and he entered upon romantic adventures; and having gone to Constantinople, and become capt. of the Væringjar, or Scandinavian body-guard of the Greek emperors, he experienced many marvelous adventures, which have supplied abundant materials for the narratives of the older sagas and modern romances of the north. Harald took part in the expedition against the pirates of the Mediterranean; visited Jerusalem, where he fought successfully against the Saracens, whom he also defeated in Sicily and Africa in 18 pitched battles. On his return to Constantinople, he drew upon himself the vengeance of the empress Zoe, whose proffered love he had rejected, and with difficulty escaped from the prison into which he had been thrown, on pretense of treason. Having made good his escape, he returned to Russia, married the daughter of duke Jaroslav, and took her with him to Norway, where his nephew, Magnus (the son of St. Olaf), agreed to divide the supreme power with him, in return for a share of his treasures. The death of Magnus in 1047 left him sole king of Norway. His unruly spirit would not, however, suffer him to rest; and in opposition to the pledge he had given his dying nephew, he entered into a war to dethrone the king of Denmark, on whose crown he had no just claim. Although he was successful in battle against the Danes, he gained no real advantages by the contest; and in 1064 he recognized the right of Svend, the nephew of Canute, to the throne of Denmark, and having concluded a peace, occupied himself for a time with the internal affairs of Norway. In 1066 he landed in England to aid Tostig against his brother Harold, king of England, but was slain in battle; his followers, after having fought with desperation, were obliged to retreat to their ships, in which they sailed for Norway, under the command of Olaf, the son of the slain monarch (Sept. 25, 1066).

HARALSON, a co. in n.w. Georgia, on the Alabama border, drained by the Tallapoosa river; 400 sq.m.; pop. '70, 4,004—319 colored. The surface is hilly and largely covered with forests. Corn and cotton are the chief productions. Co. seat, Buchanan.

HARAN, or CHARRAN, a district in the n. of Mesopotamia, and a t. 10 m. s.e. of Edessa on the river Belek, 50 m. n. of the junction with the Euphrates. The town is immediately on the highway between Arrapachitis and Canaan, and at the point where the highway is crossed by the great western road connecting Media, Assyria, and Babylonia with the Cilician coast. For the Assyrians it became a strategic position of first-rate importance, and in this respect it is mentioned in inscriptions as early as the time of Tiglath Pileser I., about 1100 B.C. It also, for the same reason, ultimately became the center of considerable commerce, one of whose specialties particularly named was the odoriferous gum derived from the strobus. It was here that Crassus in his eastern expedition was attacked and slain by the Parthians; and here also the emperor Caracalla was murdered at the instigation of Macrinus, 217 A.D. Herodian mentions the town as possessing in his day a temple of the moon; in the middle ages it is referred to as having been the seat of a particular heathen sect, that of the Haranite Sabeans. It retained its importance down to the period of the Arab ascendency; but by Abulfeda it is mentioned as having before his time fallen into decay. It is now wholly in ruins. According to patriarchal history, Haran was the first resting-place of Terah and his family, after their migration from Ur of the Chaldees, and here Terah and Nahor remained when Abraham and Lot passed on to Canaan.

HA'RAR, a city of east Africa, in the country of the Gallas, the ancient metropolis of the Hadyah empire, about 219 m. s.w. of Berbera, which lies opposite to Aden, at the mouth of the Red sea; lat. 9° 20', long. 42° 17'. The city, which is about 5,500 ft. above sea-level, lies upon the slope of a hill from w. to e.; in the latter direction are plantations of bananas, citrons, limes, the coffee-tree, the khat—a theine plant well known in Arabia—wars or "bastard saffron" (safflower), and sugar-cane; westward are gardens and orchards on a terraced slope; northward is a hill covered with tombs; and to the s., the city falls into a valley or ravine. It is about one mile long by half a mile broad. The streets and alleys are like mountain roads, strewed with rubbish and with heaps of rocks; and the abodes, built of sandstone and granite, cemented with a reddish clay, present a dingy appearance. Harar is surrounded by an irregular wall, pierced with five large gates, and defended by rudely-built oval turrets. The men are very unprepossessing in appearance; but the women are much better looking and appear to be of a different type. The men are engaged in trade, while the women spin, weave, and cultivate the gardens. Morals are very lax, and the people are much addicted to intoxication with mead and Abyssinian beer. The language of the inhabitants is Arabian, mixed with some apparently indigenous African dialect, and is spoken nowhere else. Harar is celebrated for sanctity, erudition, and fanaticism, none but the purely religious sciences being studied. The people are extremely bigoted, and hold all foreigners, but particularly Christians, in hatred and contempt. The city is governed by an emir, whose will is law, who demands the utmost obsequiousness from all under

him, but who administers his will with a certain amount of rude but prompt justice. Murderers are given up to the nearest kin, and their throats publicly cut with a butcher's knife. Harar is essentially a commercial town. It is the grand depôt for the coffee, the warsdye, the cotton, the gums, the tobacco, and the grain of the Galla country, the produce of which is conveyed to Berbera three times a year in immense caravans. There is also an enormous slave-trade carried on, Harar being a rendezvous for slave-caravans from all the surrounding countries. The imports are American cottons, shawls, silks, brass, copper, cutlery, dates, rice, sugar, gunpowder, and paper. Provisions are exceedingly cheap, 120 fowls, according to Burton, being purchased for a dollar, and the same sum sufficing to provide a man with bread for a year. The only coin is a bit of brass, coarsely stamped, equal to the 66th part of a dollar; and the emir imprisons all subjects who possess any other money.

Harar was founded by Arab invaders, who, in the 7th c., conquered and colonized the tract between the Red sea and the Abyssinian mountains. Pop. 10,000, inclusive of a considerable number of Gallas and other Bedouins. It was visited in 1855, at a great risk, by the fearless and indefatigable Burton (q.v.), to whose interesting account we are indebted for most of our information.—See Burton's *First Footsteps in Eastern Africa* (Longman, 1856).

HARBAUGH, HENRY, D.D.; 1817–67; b. Penn.; when young was a farmer, a carpenter, a miller, and a teacher. He studied at Marshall college and in 1843 became pastor of a German reformed church, and in 1864 professor of theology in Mercersburg seminary, where he was the chief exponent of the Mercersburg theology. From 1850 to 1866 he was the editor of the *Guardian*, a monthly magazine, and afterwards of the *Mercersburg Review*. He published some poems in the Pennsylvania Dutch dialect. Among his other works are *Heaven; The Heavenly Recognition; Heavenly Home; Life of Michael Schlatter; The Fathers of the German Reformed Church; Christological Theology*, and an illustrated work on the *Birds of the Bible*.

HARBOR, an inlet of the sea, so protected from the winds and waves, whether by natural conformation of the land, or by artificial means, as to form a secure roadstead for ships. It is with those harbors wholly or in part artificial that this article will deal.

Harbors may be divided into harbors of refuge, and those for commercial purposes. The latter are mostly tidal—i.e., capable of being entered by vessels only at certain states of the tide. The former are roadsteads of good depth, protected by breakwaters, and accessible at all tides, where ships may take refuge during storms. The two kinds are sometimes combined, there being the harbor proper, and a capacious protected roadstead outside of it, as at Cherbourg and elsewhere. See BREAKWATER, CHERBOURG, DOVER, PLYMOUTH, PORTLAND, HOLYHEAD.

With the birth of commerce and naval warfare, in the earliest ages of civilization, arose the necessity for artificial harbors. The Phenicians, the fathers of navigation, soon set to work to protect their scanty strip of Levantine coast. At Tyre, two harbors were formed, to the n. and to the s. of the peninsula on which the city was placed. At Sidon, similar but less extensive works long testify to the wealth and engineering genius of the Phenicians. The breakwaters were principally constructed of loose rubble.

Carthage, in another part of the Mediterranean, also possessed a harbor, though its site is not very satisfactorily determined. It was in two divisions, formed by moles; time, however, has dealt so hardly with it, that few traces remain. Still keeping to the great inland sea, we come to Greece; but here nature had provided so many navigable inlets, that little remained to be done by man. Nevertheless, some minor works were executed at the Piræus and elsewhere, chiefly, of course, for warlike purposes. The Romans, finding ships necessary to the dominion of the world, set about constructing harbors for them, in their usual solid and workmanlike manner. The coasts of Italy still show how well they understood both the principles and the practice of this branch of marine engineering. A distinguishing feature of their harbor-making is the open or arched mole. Built with open arches, resting upon stone piers, it gives full play to the tidal and littoral currents, thus preventing the deposit of sand or mud; but in proportion as this advantage is increased (by increasing the span of the arches), so also is the agitation, and consequent insecurity of the water within.

The decay of commerce and civilization, consequent upon the fall of the Roman empire, put a stop to harbor-making; nor could any want of the art be felt, until the revival of commerce by the Italian republics of the middle ages. But the rich traffic of Venice and Genoa soon led to the construction of suitable ports at those places; and the moles of the latter city, and the works in the lagunes of Venice, remain to this day. France was next in the field, embanking, protecting, and deepening the mouths of the rivers along her north-western shores, as at Havre, Dieppe, Dunkirk, etc. In 1627, during the siege of Rochelle, Metezeau constructed jetties of loose rubble-stone, to prevent access to the city.

Meanwhile, England, whose ocean-commerce is of comparatively recent date, and whose fisheries even scarcely employed a vessel three hundred years ago, lagged far behind her continental rivals. With few exceptions, her ports were absolutely unprotected, or rather uncreated; and this state of things continued until late in the last century. One of the few exceptions was Hartlepool, where a harbor was formed about

1250; and Arbroath, in 1394. In the 17th c., at Whitby and Scarborough, also in Yorkshire, rough piers were thrown out, protecting the mouth of the port; while at Yarmouth, in Elizabeth's reign, a north jetty, and subsequently a south one, were formed. An ancient mole existed at Lyme Regis. But the chief efforts of the early English engineers were directed against the shoals and waves of Dover, when, however, Smeaton rose to vindicate the engineering talent of England, things took a different turn; and now few countries surpass Great Britain in the number of artificially improved commercial harbors, or in the just appreciation of their importance.

In the construction of harbors, the great desiderata are sufficient depth of water and perfect security for the vessels likely to frequent them, together with the greatest possible facilities for ingress during any weather; while the chief obstacles to be surmounted are the action of the waves upon the protecting piers and breakwaters, and the formation of sand-banks and bars.

The design of harbors may be classified under the following heads: 1. Harbors of refuge and anchorage breakwaters; 2. Deep water and tidal harbors for commercial purposes; 3. Kanted or curved piers; 4. Straight piers; 5. Quays or wharves.

These different works are obviously suited for different localities, and for contending with different exposures. The last-mentioned is clearly suited for the most sheltered situations only, and the engineer must consider, when designing a harbor, which of all those will be most economical and effective. In judging of this, the geological features of the coast must be carefully considered. A good chart furnishes valuable evidence as to the forces to which harbor-works will be exposed. Among those may be noted the *line of maximum exposure*, or the greatest fetch or reach of open sea in front of the harbor. Mr. Thomas Stevenson, civil engineer, has proved by observations that *the waves increase in the ratio of the square root of their distances from the windward shore* as measured along the line of exposure, and he gives the following simple formula: Where h = height of wave in feet during a strong gale, and d = length of exposure in miles for distances of say 10 miles and upwards:

$$h = 1.5 \sqrt{d}.$$

The heights so obtained will be increased when they pass into confined channels, and decreased when they pass into expanding channels. The greatest measured height of the waves was by Scoresby in the Atlantic ocean, where he found billows of 43 ft. in height from hollow to crest, and 36 ft. was not an uncommon height. At Wick, Caithness-shire, waves of about 40 ft. strike the breakwater.

The greatest recorded forces exerted by the waves are the following: A mass of 13 tons was broken or quarried out of its position *in situ* on the skerries of Whalsey, in Zetland, at a level of 74 ft. above the sea; but the most astonishing feat of which we have any knowledge was at Wick breakwater, where, in the winter of 1872, a mass of masonry, concreted together as a monolith, and bound with iron bars 4½ inches in diameter, and weighing no less than 1350 tons, was torn from its seat in the work, and thrown to leeward, where it still lies in an unbroken state.

Mr. Thomas Stevenson, by means of an instrument called the marine dynamometer, has ascertained *numerically* the force which is exerted by the waves in the Atlantic and German oceans, and has found that the mean of observations during winter was more than three times that exerted during summer, the maximum force recorded being 3½ *tons per square foot.*

Various local causes materially affect the height and therefore the force of the waves. In some cases, where a strong current sets off the coast, as at Sumburgh Head roost, in Zetland, it causes a dangerous breaking sea, and while this roost or race continues to rage, the coast under lee is comparatively sheltered; but when the force of the tide is exhausted, and the roost disappears, a heavy sea rolls in upon the shore.

It is this encounter between the ground-swell of the ocean and the current of tide or land water, which causes miniature races at the mouths of rivers. Another most material element in the question of exposure is the depth of water in front of the harbor; for if that depth be insufficient to admit of the propagation of the waves, they break or spend themselves before they reach the piers. Thus, Mr. Leslie found at Arbroath harbor that the works were not so severely tried by the heaviest waves as by others of lesser size which were not tripped up and broken by the outlying rocks. In the same way at the river Alne, the harbor within the bar is more disturbed by ordinary waves than during great storms. It thus appears that the largest waves are not always so destructive as smaller ones. Mr. Scott Russell has stated the law, that waves break whenever they come to water as deep as their own height; so that 10 ft. waves should break in 10 ft. water, and 20 ft. waves in 20 ft. water. There seem, however, to be some waves which break on reaching water whose depth is equal to twice their own height. Proofs of the depth to which the surface undulations extend have been given by sir George Airy, sir John Coode, capt. Calver, and Mr. John Murray, C.E. The late Dr. Rankine has shown that the crest and trough of the sea are not, as was generally believed, equidistant from the level of stagnant water. When l is the length of the wave, H its height from trough to crest,

$$\text{Crest above still water} = \frac{H}{2} + \cdot 7854\frac{H^2}{l}.$$

$$\text{Trough below still water} = \frac{H}{2} - \cdot 7854\frac{H^2}{l}.$$

There is much difference of opinion among engineers as to the best profile or cross section of breakwaters for deep-water harbors. It is asserted by col. Jones and others, that in deep water the waves are purely oscillatory, having no power of translation, and therefore incapable of exerting any force against the masonry. This, however, is incorrect, and calculated to lead to dangerous consequences. Were there no wind propelling the waves, and no current to interfere with their character, such a result might be true. This, however, is not the case, and all sea-works, in whatever depth of water they may be placed, will assuredly have to withstand impulsive action. Besides, it must be kept in view, that in order to reduce the expense of construction, it is essential, where the bottom is soft, to make the foundation a pile of loose rubble, or concrete blocks. It follows, from what has already been said, that the rubble, by shoaling the water in front of the work, will cause the waves to become waves of translation before they reach the vertical superstructure, which, assuming the waves to have been simply oscillatory, would have reflected them without breaking, and therefore without their having exerted an impulsive force upon the masonry.

There is, however, no fixed rule as to the profile of any sea-work, which must necessarily depend upon a variety of local peculiarities, such as the nature of the bottom, and the size and quality of the materials. While a long, sloping breakwater does not offer the same amount of resistance to the waves, neither is it in itself so strong, for the weight resting on the face-stones is decreased in proportion to the sine of the angle of the slope. On the other hand, the tendency of the waves to produce horizontal displacement, supposing the direction of the impinging particles to be horizontal, is proportional *to the cube of the sine of the angle of elevation of the wall.*

In tidal harbors, or those in shoal-water, it is admitted by all that the waves break, and therefore exert an impulsive force. Such works have to withstand (1.) The direct horizontal force which tends to remove the masonry: (2.) The vertical force acting upwards on projecting stones or protuberances, and against the lying beds of the stones; (3.) The vertical force acting downwards upon the talus wall, or passing over the parapet, and falling upon the roadway; and (4.) The back-draught, which is apt to remove the soft bottom in front of the work.

In designing the ground-plan of harbors, some rules should be kept in view: (1.) The entrance should be always kept seawards of the works of masonry; (2.) Long straight piers are not so safe as those of horizontal curvature; (3.) There should be a good "loose," or point of departure free of rocks or a lee shore; (4.) The relation of the width of entrance to the area of a harbor should be a matter of careful study, as upon this depends the tranquillity of the interior, or what has been called the reductive power of the harbor. Mr. Stevenson's formula for the reductive power is as under: H = height of wave at entrance; b = breadth of entrance; B = breadth of harbor at place of observation; D = distance from mouth of harbor to place of observation; x = reduced height of wave at place of observation.

$$x = \frac{H\sqrt{b}}{\sqrt{B}} - \frac{(H + H\frac{\sqrt{b}}{\sqrt{B}}\sqrt{D})}{50}$$

The late Mr. J. M. Rendel's plan of depositing rubble from open stages of pile-work is now universally used in the construction of deep-water piers. Sir J. Hawkshaw's method, adopted at Holyhead, consists of huge, irregular, undressed masses, set in hydraulic mortar, and resting upon *pierres perdues.*

The commercial value of a harbor increases, according to Mr. Stevenson, not simply as the depth of the water is increased, but as *the cube of the depth.* Hence the great expense which is willingly incurred for securing even a foot or two of additional depth. The greatest feat in deepening is at the Tyne, where Mr. Ure, C.E., dredged out the channel to 20 ft. at low water all the way up to Newcastle. Scouring is also employed for increasing the depth, as by sir W. Cubitt at Cardiff, where 2,500 tons of water a minute are let off. The late Mr. Rendel's scheme for Birkenhead was based simply on the quantity liberated and the sectional area of the channel, and was therefore operative for any distance, and did not depend on the propelling head, or on the direction in which the water left the sluices, which conditions regulate ordinary scouring on the small scale, and which is efficacious for only short distances from the outlet.—Docks (q.v.) of various kinds are connected with harbors.

Pine timber is admirably adapted for soft soils, when the exposure is not great, but owing to the ravages of the *teredo navalis* and *limnoria terebrans* in localities where there is no admixture of fresh water, it is soon destroyed. Greenheart, African oak, and bullet-tree are little affected by the worm, as shown by experiments made in 1814

at the Bell Rock by Mr. Robert Stevenson. Even limestone and sandstone are perforated by the pholades and saxicavæ. Metals also suffer from chemical action when immersed in salt-water. Mr. George Rennie's experiments showed that wrought-iron resists this action better than cast in the ratio of 8 to 1; while Mr. Mallet's experiments show that from $\frac{1}{10}$ to $\frac{4}{10}$ of an inch in depth of castings 1 inch thick, and about $\frac{6}{10}$ of wrought-iron, will be destroyed in a century in clean salt-water. A cannon-ball $4\frac{1}{2}$ in. in diameter became oxidized to the extent of $\frac{3}{4}$ of an inch in the century. The use of Portland cement may be regarded as the most important of recent improvements in harbor construction. Blocks of any size can be formed of sand, gravel, or stones, mixed with cement in the proportion of 1 of cement to 9 of the other materials. This will set readily in still water, and in a week will be nearly as hard as any ordinary sandstone. Sea walls of cement work can also be built continuously, so as to constitute a single monolithic mass.

Reference may be made to sir J. Rennie's book on *Harbors*, to that of Mr. Thomas Stevenson on the same subject, and to the minutes of institution of civil engineers, *passim*.

HARBORS (*ante*). On the U. S. sea-coast nearly all harbors are natural, the only conspicuous exception being that at Lewes, Del. (See BREAKWATER.) The chief harbors on the Atlantic coast are Eastport, Machias, Belfast, and Portland in Me.; Portsmouth, N. H.; Newburyport, Salem, Boston, Barnstable, and New Bedford, Mass.; Newport, R. I.; New London, and New Haven, Conn.; New York (the most ample and important harbor on the continent); Perth Amboy, N. J.; Lewes, Del.; Baltimore, Md.; Norfolk, Va.; Newbern and Wilmington, N. C.; Charleston and Port Royal, S. C.; Savannah and Brunswick, Ga.; Fernandina, Key West, and Pensacola, Fla.; the latter on the gulf of Mexico; also on or near the gulf, Mobile, Ala., New Orleans, La., and Galveston, Tex. On the Pacific are San Diego, Santa Barbara, Monterey, and San Francisco, Cal.; Astoria, Or.; Port Townsend, Wash. Ter.; and Sitka, Alaska. There are many ports of less commercial importance but still having some trade. On the great lakes much has been done to improve natural or make small artificial harbors. In a business view Chicago, on lake Michigan, is the most important of the interior harbors. Here a shallow river has been deepened and some artificial means of protection are employed in the form of breakwaters. Nearly the same course has been pursued at Oswego on lake Ontario, and at Buffalo and Dunkirk on lake Erie, and a harbor of refuge is in progress on the w. side of lake Huron. There are 70 harbors on the lakes, most of which are in part artificial.

HARBORS, or PORTS, in law. In England, as well as Scotland, the right to erect and hold ports and havens is vested in the crown. Nevertheless, this right may legally exist in the subject, provided the latter can prove that he has a charter or grant from the crown, or has exercised the right from time immemorial, which presumes a charter or grant. But even though an individual has a right to a particular port or harbor, he holds it charged with or subject to the right of the public to make use of it. The crown has also the superintending power of opening and shutting ports for the purpose of prohibiting the importation or exportation of goods. It is also a settled maxim that the duties or tolls exacted should be reasonable and moderate. In England the grantee of a port is presumed to be bound to repair it; but in Scotland this obligation only extends to compel the owner to apply the dues towards repairs so far as they will go.

In most cases the powers of the common law have been insufficient to regulate the progressive wants of the public as regards harbor accommodation; and various acts of parliament have been passed for the purpose of authorizing harbors to be constructed, or extended and improved, and for exacting dues or tolls for the purpose of repaying the expenses. In 1847 a general consolidation act (10 Vict. c. 27) was passed for the United Kingdom, providing a code for the regulation of the procedure and conduct of all bodies, commissioners, etc., charged with making and improving harbors, docks, and piers. The duties of such bodies are there defined in all their details, as well as the mode of levying and collecting the tolls. The act was amended in 1861. Various local acts are also from time to time passed to meet the peculiar wants of localities. The principle of all these acts is, that the commissioners are empowered to make the works, and, by way of paying for the expense, to levy a small toll on those who use the harbor.

HARBOR GRACE, a port of entry on the w. side of Conception bay, Newfoundland, next to St. John, the most important t. in the island; pop. 6,770. The harbor is large, but greatly exposed to the sea; the wharves are protected by the beach. The place has a large trade. The most conspicuous edifice is the Roman Catholic cathedral, the seat of an archbishop.

HARBURG, an old t. and rising seaport of Hanover, in the province of Lüneburg, is situated four and a half miles s. of Hamburg, on the southmost branch of the Elbe, in a marshy district at the foot of a wooded chain of hills. It is an important Prussian station for collecting customs. Sugar-refining and tanning are extensively carried on, as well as manufactures of woolens, linens, and hosiery. Its transit-trade with Hamburg and the countries s. of the Elbe, which has long been considerable, has recently received a favorable impetus by the construction of the Hanover and Harburg railroad, and by the deepening and enlarging of its harbor, which can now accommodate 500 vessels, and

admits of landing cargoes at the wharves. The passenger-traffic between Harburg and Hamburg is carried on by steamers and ferry-boats as well as by rail. Harburg is a place of holiday resort for the Hamburgers. Pop. '75, 17,131.

HARCOURT, SIR WILLIAM GEORGE GRANVILLE VERNON, LL.D., b. England 1827; graduate at Trinity college, and took up the practice of law. In 1866 he was appointed queen's counsel. He was returned to the house of commons for the city of Oxford in the Liberal interest in 1868, and still represents that constituency. He was elected professor of international law in the university of Cambridge in 1869. He was a member of the royal commission for amending the neutrality laws, and of the royal commission for amending the naturalization laws. He was appointed solicitor-general in 1873, and held that office until the resignation of Mr. Gladstone's administration in the following February. He was one of the original contributors to the *Saturday Review*, and has written various political pamphlets and letters on international law in the *Times*, published under the pseudonym of "Historicus." The latter were reprinted in a volume, with considerable additions. He married first, Therese, daughter of lady Therese Lewis; and secondly, in 1876, Mrs. Ives, daughter of the late John Lathrop Motley.

HARDEE, WILLIAM J., 1818–73; b. Ga.; graduated at West Point, served with bravery in the Florida and Mexican wars; was on the frontier for several years; then teacher of tactics at West Point, and in 1860 was made lieut.col of cavalry. He went with the confederates in the war of the rebellion, and surrendered to the union forces in North Carolina along with Johnston's army, just at the close of the war. He is best known for a work on *Rifle and Light Infantry Tactics*, largely copied from French authorities.

HARDEMAN, a co. in s.w. Tennessee bordering on Mississippi, intersected by Big Hatchee river, and by the Memphis and Charleston, and the New Orleans, St. Louis and Chicago railroads; 760 sq.m.; pop. '70, 18,074–6,874 colored. Level with fertile soil; main products: cotton, corn, lumber, and pork. Co. seat, Bolivar.

HARDEMAN, a co. in n. Texas on Red river adjoining the Indian territory, organized after the census of 1870, and still unsettled.

HARDENBERG, FRIEDRICH VON, better known by his literary pseudonym of NOVALIS, was the son of baron von Hardenberg, and was b. at the family residence in Prussian Saxony in 1772. His father, then director of the Saxon salt-works, was a man of a religious disposition, and a member of the Herrnhut communion, while his mother is described as "a pattern of noble piety and Christian mildness." Young Hardenberg inherited the serious and reverential nature of his parents. He studied at Leipsic and Wittenberg. After a brief life, made beautiful by love, friendship, study, and literary activity, he died of consumption, Mar. 19, 1801, in the arms of his friend, Friedrich Schlegel. His chief works are *Lehrlinge zu Sais* (Disciples at Sais;) a physical romance, "containing," says Carlyle, "no story or indication of a story, but only poetized philosophical speeches, and the strangest shadowy allegorical allusions;" *Heinrich von Ofterdingen*, intended, as he himself informs us, to be an "apotheosis of poetry," but which he was not spared to finish; and *Hymnen an die Nacht* (Hymns to the Night). "Hardenberg," says Carlyle, "is the most ideal of idealists." A profound, beautiful, but indefinite aspiration breathes through all the fragments he has left us. What he lacks is force, activity, and common-sense vigor of understanding. Hardenberg belonged to the romantic school of German literature, but he took no part in the controversies of his friends. His *Sämmtliche Schriften* were published in 1802 (5th ed. 1837) by Tieck and F. Schlegel, the former of whom prefixed a biography. See Carlyle's *Miscellaneous Essays*.

HARDENBERG, KARL AUGUST, Prince Von, a Prussian statesman, was b. at Essenroda, in Hanover, May 31, 1750. He was educated at Leipsic, Göttingen, and Metzlau, and during 1770–78, traveled in Germany, France, Holland, and England. On his return to Hanover, he became privy-councilor of the exchequer, and was raised to the rank of count; but a quarrel with the prince of Wales, originating in a matter deeply affecting his honor, induced him, in 1782, to quit the service of the Hanoverian government. He now repaired to the court of Brunswick, where the duke appointed him, in 1787, president of the council of state. He was also commissioned by his master to convey the will of Frederick the great, which had been deposited in the duke's hands, to the new king, Frederick-William, who received him with marked distinction. In 1790 the markgraf of Anspach and Baireuth having requested the Prussian monarch to furnish him with a person competent to administer the affairs of his dominions, Frederick-William recommended Hardenberg. After Anspach and Baireuth were united with Prussia in 1791 Hardenberg was appointed a Prussian minister of state, and a member of the cabinet ministry. At the commencement of the war with France the king summoned him to his head-quarters at Frankfort-on-the-Main as administrator of the army. Early in 1795 he was sent to Basel, where, on April 5, he concluded a peace between Prussia and the French republic. On the accession of Frederick-William III. in 1797, Hardenberg was recalled to Berlin, and was intrusted with the management of all foreign affairs. In 1804 he became first Prussian minister on the resignation of Haugwitz, and in this capacity endeavored to preserve neutrality between France and

England. But when the French troops attacked Anspach, he changed his policy, and addressed a strong remonstrance to marshal Duroc. After the victory of Napoleon at Austerlitz, Prussia was compelled to enter into arrangements with Napoleon, Hardenberg was deprived of his office, and Haugwitz, who was friendly to the French, returned to power. In 1806 Prussia was again led to declare war, and after the fatal battle of Jena, Hardenberg accepted for some time the portfolio of foreign affairs at the desire of the emperor Alexander. In 1810 he was appointed chancellor of state. Prussia was at this period in a deplorable condition, humbled in the very dust before France; nevertheless, Hardenberg was sagacious enough to perceive that the power of Napoleon was on the wane. He labored ardently to create a national feeling—a patriotic thirst for revenge. The victories of the British troops in the Spanish peninsula, and the disasters that overwhelmed in ruin Napoleon's vast army in Russia, greatly assisted him in his efforts, and he had the satisfaction of beholding them crowned with success. His exertions were unwearied; he subscribed to the peace of Paris, June 1814; and was soon after raised to the rank of prince by his sovereign. He accompanied the allied sovereigns to London, took part in the proceedings of the congress at Vienna, and in the treaties of Paris (1815). In 1817 he reorganized the council of state, of which he was appointed president. He was also present at the congresses of Aix-la-Chapelle, Carlsbad, and Vienna, and drew up the new Prussian system of imposts. During a tour through the n. of Italy he was taken ill at Pavia, and died at Genoa, Nov. 26, 1823. The services rendered by Hardenberg to his country were undoubtedly great; to him Prussia is mainly indebted for the improvements in her army system, the abolition of serfdom, of the privileges of the nobles, and of a multitude of trade corporations, besides the complete reform of her educational system. The MSS. of his memoirs of the period from 1801 to the peace of Tilsit, were sealed up by Frederick-William III., who deposited them in the archives of the state, and forbade them to be opened before the year 1850. See Von Ranke's *Denkwürdigkeiten des Fürsten von Hardenberg* (4 vols. 1877).

HAR'DERWIJK, a small seaport and fishing-town of the Netherlands, in the province of Guelderland, is situated on the eastern shore of the Zuider Zee, 31 m. e. of Amsterdam. It is fortified after an ancient fashion. It has a harbor, but only fit for fishing-boats and small trading vessels. There is accommodation for 1000 soldiers. Pop. '75, 6,419.

HARDHACK. See SPIRÆA, *ante.*

HARDHEAD. See MENHADEN, *ante.*

HARDICANUTE, king of England, son of Canute the great by Emma of Normandy, the widow of Ethelred II. At the time of his father's death Hardicanute was in Denmark, and the throne of England was usurped by Harold his younger brother, Emma, however, preserving her son's authority over Wessex. In this state matters remained for some time, till Alfred, Emma's younger son by Ethelred, invaded the kingdom; but the invaders being annihilated by earl Godwin, Harold's general, Emma was obliged to seek refuge at Bruges, whence she sent to Hardicanute to acquaint him with the state of affairs in England. Hardicanute being of an easy and self-indulgent disposition, allowed two years to pass before taking any steps to assert his rights. Roused at last by his mother's remonstrances, he, in 1039, equipped a fleet and army, and was about to sail for England to dispossess the usurper, when he was met by a deputation of English nobles, who informed him of the death of Harold, and offered him the crown. Hardicanute reigned in England till 1042, when, after a quiet reign, he died of apoplexy, induced by his gluttonous habits. With Hardicanute ended the Danish line in England.

HARDIE, JAMES ALLEN, b. N. Y. 1823; graduated at West Point in 1843, and entered the artillery service. During the war of the rebellion he accompanied McClellan as aid-de-camp in the Maryland campaign, distinguished himself in the Rappahanock campaign, and was delegated to special duty in the war department. In 1866 he proceeded as senior member of commission to inspect the forts and arsenals of the union, and was more than once auditor of military claims. He has published several military reports, and has contributed to several leading periodicals.

HARDIN, a co. in s.e. Illinois on the Ohio river; 175 sq.m.; pop. '70, 5,113. It has a rough surface and fertile soil; productions: corn, wheat, oats, etc. Co. seat, Elizabethtown.

HARDIN, a co. in n. central Iowa, intersected by the Dubuque and Sioux City, the central Iowa, and the Illinois Central railroads, and the Iowa river; 576 sq.m.; pop. '75, 15,029. It has an undulating surface of prairie and woodland; chief productions: wheat, corn, oats, hay, and pork. Co. seat, Eldora.

HARDIN, a co. in n. central Kentucky bounded e. by Salt river, and for a short distance on the n. by the Great Southern, and the Paducah and Elizabethtown railroads; 550 sq.m.; pop. '70, 15,705–2,276 colored. The surface is hilly and to a great extent covered with forests. Chief productions: corn, wheat, oats, and tobacco. Co. seat, Elizabethtown.

HARDIN, a co. in n.w. Ohio, on Scioto river, intersected by the Cincinnati, Sandusky and Cleveland, and the Pittsburg, Fort Wayne and Chicago railroads; 480 sq.m.; pop. '70, 18,714. The surface is level and there is much forest-land. Wheat, corn, hay, oats, and pork are the chief products. Co. seat, Kenton.

HARDIN, a co. in s. Tennessee, intersected by Tennessee river, which is navigable for steamers; 600 sq.m.; pop. '70, 11,768—1447 colored. Much of the land is covered with timber. Chief productions: cotton, corn, and pork. Co. seat, Savannah.

HARDIN, a co. in s.e. Texas, bounded by the Neches river; 900 sq.m.; pop. '70, 1460—242 colored. Very little of the soil is under cultivation, but corn, cotton, sugar, and rice are produced. Co. seat, Hardin.

HARDIN, JOHN, 1753–92; b. Va.; served in a rifle corps in the revolutionary war. In 1790 he served in the Indian wars under Harmar, and two years later was killed under a flag of truce by Indians, who coveted his horse and equipments.

HARDING, CHESTER, 1792–1866; b. Mass.; a portrait painter. He was of a family in reduced circumstances, worked on a farm and with a chair-maker, and afterwards with a house-painter. With the ordinary paints of the business he attempted portraits, and was not long in finding his true calling. In 1833 he went abroad and studied for three years. Among those whose portraits he painted were Madison, Monroe, J. Q. Adams, chief-justice Marshall, Charles Carroll, William Wirt, Clay, Webster, Calhoun, Washington Allston, Samuel Rogers, lord Aberdeen, the dukes of Norfolk, Hamilton, and Sussex, and Daniel Boone.

HARDING, STEPHEN, the third abbot of the celebrated monastery of Citeaux, and one of the most remarkable religious reformers of the 12th century. Of his parentage and youthful history, little is known beyond the fact that he was of a noble English family, and in early life a soldier. Under one of those religious impulses which so frequently occurred in the middle ages, he undertook a pilgrimage to Rome. He subsequently entered the French monastery of St. Claude de Joux, where he was so distinguished by his strict and exemplary life, that he was chosen abbot of the monastery of Bèze, with a view to the reformation of its discipline, which had become much relaxed. From this monastery he was transferred to that of Citeaux, where, on the death of Alberic in 1109, he was elected abbot. The rigor of observance which he here enforced had such an effect in deterring novices from entering the new order, that at first grave fears were entertained for its stability; but Stephen, placing his trust in the good cause which he had undertaken, persevered in the cause of reform; and he was rewarded, in 1113, by the accession of St. Bernard and thirty other youths, whose eminent virtue gave such an impulse to the institute, that in a short time the number of claimants for admission compelled him to found several new convents, and especially that of Clairvaux, which, under the rule of St. Bernard, attained to the very highest distinction in that age. Abbot Stephen continued, till his death in 1134, to direct the fortunes of the Cistercian order; and in 1119 he drew up, in conjunction with St. Bernard and other members of the brotherhood, the well-known constitutions of the order, entitled *Carta Caritatis*, which were approved by popes Calixtus II. and Eugenius III., and, with some modifications, have continued down to modern times, as the rule of the Cistercian institute. See *Mabillon Annal. Benedictin.* t. v. p. 205.

HARDINGE, CHARLES STEWART, Viscount, b. England, 1812; graduated at Oxford; represented Downpatrick in the house of commons from 1854 to 1856, when he succeeded to his title. Under lord Derby he was under-secretary of state for the war department. While his father was governor-general of India, young Hardinge was his secretary, and served as a major in the wars with the Sikhs. On his return he published *Views in India*, a sumptuous work illustrated with his own drawings.

HARDINGE, Viscount HENRY HARDINGE, field-marshal and commander-in-chief of the British army, the third son of the rev. H. Hardinge, rector of Stanhope, in the co. of Durham, was born Mar. 30, 1785, and was gazetted as ensign before he had attained his 15th year. He obtained a brigade command before his 25th year, and his foreign grade was commuted, shortly afterwards, for British rank, after which he was attached to the Portuguese army from 1809–13, in the capacity of deputy quarter-master-general. When Napoleon effected his memorable return from Elba, Hardinge joined the allied armies in Belgium, and was appointed by the duke of Wellington commissioner at the Prussian head-quarters. He lost his hand at Ligny, and was thus unable to participate in the crowning victory of Waterloo. In 1826 he entered parliament; and in 1828 succeeded lord Palmerston in the government of the duke of Wellington, as secretary of war. He next filled the office of secretary of Ireland. In 1844 he accepted the high post of governor-general of India, which he filled until 1847. When the great Sikh war broke out, he hurried to the north-western frontier of India, and served as second in command under lord Gough during the sanguinary and hard-fought battles of Moodkee, Ferozeshah, and Sobraon. After the pacification of Lahore, his services were rewarded by a viscounty, the East India company granting him a pension of £5,000, and parliament voting him an annuity of £3,000, for himself and his next two successors. On the death of the duke of Wellington in 1852, Hardinge was appointed commander-in-chief of the British army, a distinguished post which he filled during the

eventful epoch of the Russian war, and which he only resigned a few months before his death. In Oct., 1855, he was advanced to the rank of field-marshal. He died Sept. 24, 1856, at his seat, South Park, near Tunbridge, Kent.

HARD LABOR, an addition often made to the punishment of offenses besides mere imprisonment. This practice is said to have been introduced by the statute of 5 Anne, c. 6. It is now firmly established in the United Kingdom; and by express statute, the power of adding hard labor to the punishment of imprisonment, has been given in most cases, both as to indictable offenses and the more disgraceful offenses which are punishable summarily. The kind of labor is prescribed by the rules of the jail or prison, where provision must be made of the proper materials for the purpose. Picking oakum, working the tread-mill, etc., form part of this labor; and in general, the number of hours for such labor, unless in case of sickness, is ten hours daily.

HARDNESS, SCALE OF. The hardness of a body is measured by its power of scratching other substances. Variations in the degree of hardness presented by different crystallized bodies often furnish a valuable physical sign by which one mineral may be readily distinguished from others closely resembling it. Mohs selected ten well-known minerals, each succeeding one being harder than the preceding one, and thus formed the *scale of hardness*, which has been generally adopted by subsequent mineralogists. Each mineral in the following table is scratched by the one that follows it, and consequently by all the subsequent ones, and the hardness of any mineral may be determined by reference to the types just selected. Thus, if a body neither scratches nor is scratched by feldspar, its hardness is said to be 6; if it should scratch feldspar but not quartz, its hardness is between 6 and 7—the degrees of hardness being numbered from 1 to 10. The figures on the right indicate the number of known minerals of the same or nearly the same degree of hardness as the substance opposite to which they stand:

SCALE OF HARDNESS OF MINERALS.

1. Talc	23	6. Feldspar (any cleavable variety)	26
2. Compact gypsum, or rock-salt	90	7. Limpid quartz	26
3. Calcspar (any cleavable variety)	71	8. Topaz	5
4. Fluor-spar	53	9. Sapphire, or corundum	1
5. Apatite	43	10. Diamond	1

The cause of the varieties of hardness observed in different bodies is not known. The same substance—as, for example, a piece of steel—may, under the influence of different circumstances, be so soft as to take impressions from a die, or may be nearly as hard as a diamond.

HARDOUIN, JEAN, was b. in 1645, at Quimper, in Brittany, where his father followed the trade of a bookseller. Hardouin received his first education in the schools of the Jesuits, and being received into that order at the age of 20, completed his studies in Paris. On the death of Père Garnier in 1683, Hardouin was appointed librarian of the college of Louis le Grand, in which office he enjoyed full leisure for the literary pursuits in which he delighted, and in which his extravagances have acquired for him a notoriety almost without any parallel in the annals of literary eccentricity. Dupin places him among the very first scholars of his learned brotherhood. In a spirit of literary skepticism which it is difficult to look upon as serious, he maintained, not only that the entire body of classical literature, with the exception of in Latin, Pliny's *Natural History*, Virgil's *Georgics*, the comedies of Plautus, and Horace's *Satires*, and in Greek, Homer's *Iliad*, and Herodotus's *History*, was falsely ascribed to the authors whose various names it bears, but that it was all the production of the monks of the 13th century! In the same skeptical spirit, he rejected as spurious all the reputed remains of ancient art, together with the inscriptions and coins which are attributed to classical times; nay, he extended the same skepticism to the Septuagint version of the Old Testament, and even to the Greek text of the New, the original language of which he held to have been Latin! Opinions so extravagant naturally called forth the reprobation of the authorities of his order. He was required to retract them; and there is some reason to believe, that they were put forward by him rather from a love of paradox and a morbid desire of notoriety, than from any serious conviction of their probability. Nevertheless, with all this extravagance, the erudition of Père Hardouin was beyond dispute, and most of his works are of great historical and critical value. His edition of Pliny (5 vols. 4to, Paris, 1689) is a prodigy of learning and industry. Of his remaining works, the most valuable is his great *Collectio Conciliorum* (12 vols. folio), a work of great learning and utility, which has the rare advantage of possessing one of the best indexes extant; a commentary on the New Testament in folio; several volumes on the study of numismatics and chronology; and a vast number of dissertations and essays in the *Mémoires de Trevoux*. He died at the age of 83, in the convent of his order in Paris, Sept. 3, 1729.

HARDWAR, or HURDWAR, an old t. of India and place of pilgrimage, in Saharanpur district on the right bank of the Ganges at the foot of the Siwalik hills. Pop. '72, 4,800. The town is of great activity, and has borne many names. It was originally known as Kapila. Hwen Thsang, the Chinese Buddhist pilgrim, in the 7th c.

A.D., visited a city which he calls Mo-yu-lo, the remains of which still exist at Mayapur, a little to the s. of the modern town. Among the ruins are a fort and three temples, decorated with broken stone sculptures. The great object of attraction at present is the Hari-ke-charen, or bathing *ghat*, with the adjoining temple of Gangadwara. The *charan*, or foot-mark of Vishnu, is imprinted on a stone let into the upper wall of the *ghat*, and forms an object of special reverence. A great assemblage of people takes place annually, and every twelfth year a feast of peculiar sanctity occurs, known as a *kumbh-mela*. The ordinary number of pilgrims at the annual fair amounts to 100,000, and at the kumbh-mela to 300,000. The Hardwar meeting also possesses considerable mercantile importance, being one of the principal horse-fairs in upper India. Commodities of all kinds, Indian and European, find a ready sale, and the trade in grain and food stuffs forms a lucrative traffic. The Ganges canal draws its supply of water from a branch channel close to the town.

HARDWARE, a commercial term applied to the commoner articles made of iron, copper, or brass, such as locks, keys, anvils, grates, shovels, etc. The great hardware manufactures of this country are at Birmingham, Wolverhampton, Walsall, Willenall, Sheffield, etc. The extent of the trade of these places is enormous; the value of the exports of hardware alone amounting to millions. The returns for the years 1875 give for hardwares, including cutlery, £4,265,451. See IRON.

HARDWARE (*ante*), includes an enormous variety of articles manufactured from iron, copper, brass, or bronze, which are variously known as *carpenters'*, *housekeepers'*, or *builders'* hardware. It is almost impossible to classify the articles which come under the general term, including, as it does, many used by saddlers, miners, contractors, machinists, stationers, carbuilders, and furniture-makers and dealers. Toys, and the limitless varieties of what are called "fancy" articles, all belong to this branch of manufacture, and the yearly traffic in such ware is almost incomputable. A return of £12,000,000 was reported to the British government in 1871 from the principal hardware marts, while in the U. S. census of 1870, the different branches of American industry in hardware produced $142,836,272.

HARDWICK, CHARLES, 1821–59; b. England; killed by a fall in the Pyrenees. By his own efforts he obtained a good education, and in 1853 was professor of divinity in Queen's college. He was ordained a deacon and priest, and but a short time before his death was appointed arch-deacon of Ely. He published *History of the Middle Age of the Church*, *Christ, and Other Masters*, etc.

HARDWICKE, PHILIP YORKE, first earl of, 1690–1764; b. England; educated to the law, called to the bar in 1715, and four years afterwards was elected to the house of commons from Lewes, on which occasion the government paid his election expenses. In 1720 he was made a knight, and appointed solicitor-general, rapidly rising to be lord chief-justice of the king's bench, and in 1737 lord chancellor. While George II. was out of the country (1740–48 and 1752) the chancellor was one of the justices selected to administer the government. In 1754 he was made an earl, but two years later he resigned his office, and retired from public life.

HARD-WOODED TREES are forest-trees of comparatively slow growth, producing compact, hard, and valuable timber, as oak, ash, elm, chestnut, walnut, beech, birch, etc. From these, willows, elders, poplars, etc., are distinguished as *soft-wooded trees*. Neither term is extended to firs, pines, cedars, or other coniferous trees, the wood of which is of a peculiar and very different character.

HARDY, a co. in n.e. West Virginia, on the s. branch of the Potomac and the Cacapon rivers; 570 sq.m.; pop. '70, 5,518—616 colored. Its surface is mountainous, and to a large extent covered with timber. The valleys are fertile; corn and wheat are the main products. Co. seat, Moonfield.

HARDY, ALEXANDRE, 1560–1631; a French author; in early life writer for a strolling dramatic company, and later the dramatist for the *Théâtre du Marais*. He is said to have been after Lope de Vega and Calderon, the most fertile of dramatic authors, having written over 600 plays. He became a master of stage business and stage effects. To the student of the drama, Hardy will always be an interesting figure, appearing as he does between the degraded morality and the modern comedy, an imitator alike of Italian pastoral and Spanish tragedy. He gave little heed to art; he thought entirely of what would succeed for the moment. His best play is the tragedy of Marianne.

HARDY, GATHORNE, b. 1814; well known in English public life as a conservative politician and leader. He was under-secretary of state for the home department in 1858–59, and entered the British cabinet in 1866 as president of the poor-law board, the earl of Derby being premier. The cabinet resigned, however, two years later, and in 1869 Hardy was returned to parliament from Oxford university. In 1874 the earl of Derby again came into power, when Hardy was placed in charge of the war department, and in 1878, under the administration of the marquis of Salisbury, he was made secretary for India, and created viscount Cranbrook.

HARDY, THOMAS, b. 1840; an English writer of fiction. He served his time as an apprentice to an architect, and prosecuted his profession in London, where he became

chiefly known as a designer, favoring the modern Gothic style. In 1863 he received a prize from the institute of British architects for an essay on *Colored Brick and Terra-Cotta Architecture*, and also one for architectural design. Recognizing that he possessed skill as a writer, he turned his attention to fiction, and published his first work in 1871, without achieving marked success. In 1872 he brought out *Under the Greenwood Tree*, and in the following year, *A Pair of Blue Eyes*, and by these novels placed himself in the front rank of contemporary novel writers. His later works, *Far from the Madding Crowd* and *The Hand of Ethelberta*, have served to confirm public opinion of the excellence of his work. Mr. Hardy is a most original writer, skilled in the delineation of character, graphic, and sometimes dramatic in depicting situations, and a writer of strong and pure English.

HARDY, Sir THOMAS MASTERMAN, 1769–1839; was made commander in 1797 for distinguished bravery in the battle of St. Vincent. In 1803 he was Nelson's flag-captain, and at the battle of Trafalgar (Oct. 21, 1805) received Nelson's last words, "Don't throw me overboard: kiss me, Hardy." Hardy commanded the South American squadron from 1820 to 1824, and six years later was made a lord of the admiralty. In 1834 he was one of the governors of Greenwich hospital.

HARE, *Lepus*, a genus of rodent quadrupeds, of which there are many species very similar to each other. The Linnæan genus *lepus* now forms the family *leporidæ*, which includes the genera *lepus* and *lagomys*, and of which a peculiar characteristic is the presence of two small incisors immediately behind the ordinary rodent incisors of the upper jaw, so that these teeth seem to be double. The molar-teeth, six on each side above and five below, are transversely grooved, being formed of two vertical plates soldered together. All the animals of this family feed exclusively on vegetable food, and chiefly on herbage, although they are also fond of grain, roots, and the bark of trees. Their fore-feet have five toes, their hind-feet four; the soles are hairy. Their fur is soft; the colors mostly gray or brown, the alpine and arctic species becoming white in winter.—The COMMON HARE (*L. timidus*) is widely distributed over Europe and the northern and central parts of Asia. The IRISH HARE (*L. Hibernicus*) has, however, recently been described as a distinct species. It differs from the common hare in its rounder head, shorter ears, and shorter limbs; also in having the fur composed only of one kind of hair, short and soft, with none of the long black-tipped hairs which are mixed with this in the common species. The fur, therefore, is of no value. The common hare is not found in Ireland. Notwithstanding the character of timidity usually ascribed to the hare, it is really a pugnacious animal, and displays no little courage in encounters with those of its own race, or with animals of nearly equal powers. It has been an object of the chase from a very early period. Xenophon, in his *Cynegeticus*, gives an enthusiastic description of the sport. Concerning the hunting of the hare, see COURSING. Being evidently designed to seek safety from enemies by fleetness, the hare, however well supplied with food, never becomes fat. It ordinarily lies quiet in its *form* during the day, and goes in quest of food in the evening and morning. Where, through game preserving, it is abundant, it does no little damage to crops. It is a prolific animal, although not nearly so much so as the rabbit. The female produces from two to five at a birth. The young (*leverets*) are born covered with hair, and with the eyes open.—The VARYING HARE or ALPINE HARE (*L. variabilis*), which inhabits the mountains both of the n. and s. of Europe, and is found on those of Scotland and of Cumberland, is remarkable for the change of color which it undergoes, without change of hair, on the approach of winter. Ordinarily of a bluish-gray color, it becomes of a shining white, the change beginning with the feet, and extending upwards, terminating with the back. This, which in many places is called the *blue* hare, is about equal in size to the common hare, but has shorter limbs and ears, and is less swift.—In the arctic regions both of the old and new worlds, the ARCTIC HARE or POLAR HARE (*L. glacialis*) abounds. It is entirely white in winter, brownish-gray in summer, has long soft fur on the belly, and fine thick fur on the back; is considerably larger than the common hare, and spends the whole year without hibernation, even in Melville island, and similar cold desolate regions; lichens and mosses probably affording it the greater part of its food.—North America produces a number of other species of hare, of which some inhabit the swamps of the southern states.—India has a hare (*L. ruficaudatus*) very similar to the common hare; other species are found in other parts of Asia, Egypt, the cape of Good Hope, etc. The fur of the hare is used for felting for making hats and other purposes.

HARE, in point of English law, is one of the wild animals called game (q.v.), and is specially protected by the game-laws for the benefit of the owners of land. There is no close season as to hares, which may therefore be lawfully killed by a licensed sportsman all the year round. Being game, hares can only be bought from a licensed dealer, and sold by licensed persons. The owner of inclosed land, and also the tenant, if otherwise entitled by his lease to kill hares, may do so without a license. So those who hunt them with greyhounds or beagles require no license. All others require a license. To kill hares unlawfully by night in a warren, or place kept for breeding hares, is now a misdemeanor by 24 and 25 Vict. 96, s. 17; to kill them elsewhere, is only a misdemeanor when the third offense is committed. In Scotland, the law is substantially the same, except that the killing of hares unlawfully by night is only an offense

punishable summarily, unless it is a third offense, when it becomes indictable. In Ireland, there is a close season, when hares cannot be killed—viz., between the first Monday in Nov. and the first Monday in July following. See Paterson's *Game-laws of the United Kingdom.*

HARE, AUGUSTUS JOHN CUTHBERT, b. Rome, 1834, of English parents; educated at Harrow and Oxford, and devoted himself to literature. Among his publications are *Epitaphs for Country Churchyards; Walks in Rome; A Winter at Mentone; Memorials of a Quiet Life; Walks in London;* and a number of guide books.

HARE, AUGUSTUS WILLIAM, 1793–1834; brother of the archdeacon; b. England; educated at Oxford, and ordained rector in 1829. He wrote with his brother *Guesses at Truth,* and by himself, *Sermons to a Country Congregation.*

HARE, JULIUS CHARLES, 1796–1855; b. Italy; a theological writer. He passed a winter at Weimar, where he met Goethe and Schiller, and received a bias to German literature which influenced his style and sentiments throughout his whole career. On the death of his mother in 1806, Julius was sent home to the charterhouse in London, where he remained until 1812, when he entered Trinity college, Cambridge. There he became fellow in 1818, and after traveling abroad he began to read law in London in 1819. In 1822 he was appointed assistant-tutor at Trinity college, which position he retained for 10 years. Turning his attention from law to divinity, he was ordained in 1826; and on the death of his uncle in 1832, he succeeded to a rich family living in Sussex, where he accumulated a library of 12,000 volumes, especially rich in German literature. Before taking up his residence in his parish, he once more went abroad, and made, in Rome, the acquaintance of the chevalier Bunsen, who afterwards dedicated to him part of his work, *Hippolytus and his Age.* In 1840 Hare was appointed archdeacon of Lewes, and in the same year preached a course of sermons at Cambridge, *The Victory of Faith,* followed in 1846 by a second, *The Mission of the Comforter.* Neither series when published attained any great popularity. He married in 1844. In 1851 he was collated to a prebend in Chichester; and in 1853 he became one of the queen's chaplains.

HARE, ROBERT, 1781–1858; b. Philadelphia; in early life a brewer, but afterwards gave his attention to science, particularly chemistry. In 1802 he invented the oxy-hydrogen blow-pipe, and was the first to render fusible lime, magnesia, iridium, and platinum. In 1818 he was professor of chemistry in Pennsylvania university, holding the chair 29 years. His collection was presented to the Smithsonian institution. Besides many papers in the scientific journals he published *Brief View of the Policy and Resources of the United States; Chemical Apparatus and Manipulations;* and a *Compendium of the Course of Chemical Instruction.*

HAREBELL, or **BLUEBELL,** *Campanula rotundifolia,* the most common of all the British species of bellflower (see CAMPANULA), growing abundantly in dry and hilly pastures, on waysides, etc.; flowers in summer and autumn. It is common in most parts of Europe, and even to the extreme north. It is everywhere a favorite from its beauty and gracefulness, and is the subject of many allusions in poetry. It is a perennial plant, with a slender stem 6 by 14 in. high, sometimes bearing only one flower, but more generally a loose panicle of a few drooping flowers, on very slender stalks; the flowers sometimes white, but generally bright blue, bell-shaped, and fully half an inch long. The juice of the flowers yields a fine blue color, and may be used as ink.

HA'RELD, *Harelda,* a genus or sub-genus of ducks of the oceanic section (see DUCK), nearly allied to pochards, seaups, etc.; having a short, thick bill, high at the base, the laminæ projecting at the edge of the mandibles, a high forehead, a thick neck, and two feathers of the middle of the tail in the males greatly elongated; whilst the females have the tail short and rounded.—The LONG-TAILED DUCK, or HARELD (*H. glacialis*), inhabits the arctic regions both of the old and new worlds, remaining on the seas of the north as long as any water remains unfrozen, and then betaking itself to more southern regions. It is plentiful, during winter, in the inlets of Orkney and Shetland, but is rather rare in the southern parts of the British islands. It is sometimes brought to the London market. Its winter migrations in America extend as far south as Texas. The male, particularly in its summer plumage, is a very beautiful bird. It is about 17 in. long, without the long tail-feathers; with them, 22 or 24. It is a very lively and noisy bird; flies swiftly, and is a most expert diver. It lines its nest with down, which is said to be equal to that of the eider, but has not yet become an article of commerce.

HARELIP, a congenital perpendicular fissure or fissures through the upper lip, the result of an arrest of development, (Erichsen). It is named from its resemblance to the lip of a hare, but according to Geoffroy St. Hilaire, it is not analagous to that form of development, but to that which occurs in animals of lower development, viz: fishes. When the arrest of development takes place on one side only, the malformation is called single harelip, and according to Erichsen, it most frequently is located on the left side. When the fissure occurs on each side of the median line the malformation is called double harelip, and the fissure is always deeper on one side than on the other, generally extending into the nostril when it produces cleft palate, the nose being flattened and expanded. Median fissure is extremely rare. Delahaye saw a case of the upper lip, and Nicati one of the lower lip. The cure of harelip requires a very careful operation.

There is difference of opinion as to whether the operation ought to be performed before or after dentition, and those who advocate waiting urge that young children are apt to have convulsions from various exciting causes. The weight of authority, however, appears to be in favor of early operations, which are easier to perform before dentition. The child will also be better able to nurse, after the operation. In operating, it is important to procure direct union of the edges of the fissure, which are carefully pared and held together by silver sutures and straps of plaster, and a check compresser, an ingenious apparatus by which pressure upon the cheeks tends to keep the cut parts in opposition. The application of water-dressing, or a weak solution of carbolic acid, is often found serviceable, but need not be constantly applied unless, unfortunately, great inflammation occurs, when feeding will have to be done through a tube; but this is rarely the case.

HAREM, the European title for that portion of a polygamist's house which is devoted to the exclusive occupancy of his wives and their attendants, or, by a simple metonymy, for the female portion of his household. The word *harem* is Arabic for anything forbidden or not to be touched. It is generally applied in Moslem law to such things as games of chance, draughts, chess, witchcraft, and portrait-taking, which are inconsistent with the religious code, and under the form of *haram* it is well known, even to Europeans, as designating the sacred inclosure of the principal mosque at Cairo and at Jerusalem (*Haram-esclsaberig*). The word seraglio, which is not unfrequently employed as equivalent to harem, is an equivalent modification of the Persian term *serai*, which means a palace or large building, as in the familiar compound *caravanserai*. Wherever polygamy is maintained in the midst of a developed social life, the harem appears to be an almost inevitable institution. We consequently find it after a more or less rigid type among the Jews, the Babylonians, the Siamese, the ancient Persians, the Peruvians, etc. But it is among the modern Mohammedan peoples that it has attained its most perfect development; and the harems of the sultan of Turkey and the shah of Persia may be taken as the most elaborate and best-known specimens of the type. According to the Koran, the Mussulman is required to satisfy himself with four wives, but the sultan may possess as many as seven. Each of these has her own suite of apartments, her own garden and bath-room, and her own body of servants, male and female. They are not called by their names, but distinguished as *kadin* (or lady) number one, number two, and so on. The title of *sultana* is bestowed only on the mother, the sister, or the daughter of a sultan; and consequently it is the kadin who first gives birth to an heir to the empire who alone can have this distinction. She further obtains the title of *hasseky* or *kasseky*, but this is lost if the child dies. All the female slaves, or as they are called *odalisks* (a European corruption of the word *odalik*, from *oda*, a chamber, and *lik*, belonging to), are at the absolute disposal of the sultan, and if, in spite of the natural endeavors of the kadins to prevent such a contingency, one of them becomes the mother of her lord and master's first-born, she is advanced to the rank of *sultana hasseky*. It is contrary to etiquette for the sultan to select his own favorites among the odalisks; he is expected to accept the choice made for him by his mother, who bears the title of *valide*, and exercises great influence not only in the affairs of the harem but even in political matters. Every odalisk who has been promoted to the royal favor is henceforth considered sacred from all meaner patronage, and receives apartments and attendants of her own; but she has no further claim to the sultan's attention, and may have to console a life-long widowhood with the memory of the honor which was once bestowed on her. The ranks of the odalisks are ever and anon recruited by slaves presented to the sultan by his female relatives or the state officials. An old and devoted favorite of the sultan occupies the post of *kehaya chatun*, or lady superintendent of the harem. A large body of eunuchs, both black and white, are employed as guards and gate-keepers. The white eunuchs have charge of the outer gate of the seraglio, but they are not allowed to approach the women's apartments, and obtain no posts of distinction. Their chief, however, the *kapou aghassi*, or master of the gates, has part control over the ecclesiastical possessions, and even the vizier cannot enter the royal apartments without his permission. The black eunuchs have the right of entering the gardens and chambers of the harem. Their chief, usually called the *kizlaer aghassi*, or master of the maidens, though his true title is *darus seadet aga*, or chief of the abode of felicity, is an official of high importance. His appointment is for life. If he is deprived of his post he receives his freedom; and if he resigns of his own accord he is generally sent to Egypt with a pension of 100 francs a day. His secretary keeps count of the revenue of the mosques built by the sultans. He is generally succeeded by the second eunuch, who bears the title of treasurer or *khaznahdar*, and has charge of the jewels, etc., of the women. The number of eunuchs is always a large one. The sultana *valide* and the sultana *hasseky* have each fifty at their service, and others are assigned to the kadins and the favorite odalisks. [*Encyc. Brit.*, 9th ed.]

HARE'S-EAR, *Bupleurum*, a genus of plants of the natural order *umbelliferæ*, having compound umbels of yellow flowers, and generally simple leaves. The leaves of the most common British species, *B. rotundifolium*, embrace the stem and are roundish oval. This plant, which grows in corn-fields in the chalk districts, is the *thorough-wax* of the old herbalists, and was once in repute as a vulnerary, but has fallen into

disuse. The species of hare's-ear are numerous, and are natives of temperate climates in most parts of the world.

HARFLEUR (called in the middle ages *Hareflot*), a small t. of France, in the department of Seine-Inférieure, is situated near the mouth of the Lézarde, on the northern bank of the Seine, about 4 m. e. of Le Havre. The chief building is a beautiful Gothic church with an elegant tower, built by the English as a memorial of the victory of Agincourt. Pop. 1900, who are employed in fishing and the rearing of cattle. In former times, before the rise of Havre, Harfleur was a flourishing town, and was the key to the entrance of the Seine. Its harbor now forms a meadow. It was taken by the English under Henry V. in 1415, retaken by the French in 1433; in 1440 it was again seized by the English, and 10 years after was recaptured by Charles VII. of France. Off this town the duke of Bedford took or destroyed nearly 500 French ships, Aug. 15, 1416.

HARFORD, a co. in n.e. Maryland, bordering on Pennsylvania, bounded in part by Chesapeake bay and the Susquehanna; crossed by the Philadelphia, Wilmington and Baltimore railroad; 450 sq.m.; pop. '70, 22,605—4,855 colored. The surface is uneven, and the soil fertile; wheat, corn, oats, and pork are the chief products. Co. seat, Bel Air.

HARGRAVES, EDMUND HAMMOND, b. England, 1815. When 18 years old he settled in Australia. In 1849 he went to California, where he was so much impressed with the resemblance of the gold region to certain parts of Australia that he undertook to search for the precious metals in the latter country. He was successful, and was the first discoverer of Australian gold, for which he received rich presents and honors, the legislative council of New South Wales awarding him £10,000. In 1854 he returned to England and published *Australia and its Gold Fields*.

HARGREAVES, JAMES, whose name will ever be remembered in connection with the cotton manufacture of this country, as the inventor of the carding-machine and the spinning-jenny, was an artisan at Stanhill, near Blackburn, where he was born. Hargreaves was an illiterate man, and supported himself and family by weaving and spinning, carried on in his own house, according to the custom of the time. In 1760 he invented the carding-machine, as a substitute for the use of hand-cards; and four years later, he produced the spinning-jenny. Hargreaves had frequently tried to spin with two or three spindles at once, holding the several threads between the fingers of his left hand, but the horizontal position of the spindles frustrated his attempt. One of his children, however, is said to have upset the spinning-wheel while he was at work, and as he retained the thread in his hand, the wheel continued revolving horizontally, and the spindle vertically. The observation of these motions produced the thought, that if a number of these spindles were placed upright and side by side, many threads could be spun at once. Hargreaves now put his idea into practice, and the result was the *jenny*, at which he and his family worked, till the large amount of cotton which they spun having excited suspicion, his fellow-spinners, imbued with strong prejudices against machinery, broke into his house and destroyed his frame. He then removed to Nottingham in 1768, where he erected a spinning-mill. Two years later, he took out a patent for his machine; and discovering that it was in use by manufacturers in Lancashire without his permission, brought an action for £7,000 damages. Pending the trial, he was offered by a company £3,000 for the use of the jenny, but refused; and it having been proved that he sold some of his machines before the patent was obtained, it was thereby declared to have been invalidated, and his claim for compensation fell to the ground. Thus the inventor was but little benefited by his work. Hargreaves continued to carry on business as a yarn manufacturer, in conjunction with a Mr. Jones, with moderate success, till his death in April, 1778, when his share in the mill was bought by his partner for £400. His country never gave Hargreaves any reward for the invention to which so much of its wealth is due; yet it is but just to the memory of the late sir Robert Peel to state, that one of his last acts as a British minister, was to bestow on the youngest and only surviving daughter of this inventor, the sum of £250 from the royal bounty fund.

HARIKARI. See HARRI-KARI.

HÄRING, WILHELM, better known under the name of WILIBALD ALEXIS, a German novelist, was b. at Breslau in the year 1798. He was educated in Berlin, and served as a volunteer in the campaign of 1815. He afterwards studied law at Berlin and Breslau, but abandoned this pursuit for a literary career. After several poetical and other literary efforts Häring first made himself known over all Germany and abroad by his romance of *Walladmor* (2d edit. 1823–24), written in consequence of a wager with a friend that he would produce a work which should be mistaken for one of sir Walter Scott's. *Walladmor* was a most audacious mystification, and was greedily devoured in Germany as a production of the Scottish novelist. It was translated into various languages, among others into English by Thomas de Quincey (London, 1824), whose translation, however, departed so widely from the original, that it hardly deserved the name. Häring likewise wrote several admirable tales, but his chief excellence is displayed in the field of historical romance. His *Cabanis* (6 vols. 1832), notwithstanding

many defects, may be regarded as his best work; *Roland von Berlin* (3 vols. 1840); *Der falsche Waldemar* (3 vols. 1842); *Hans Jürgen und Hans Jochem* (2 vols. 1846); *Der Wärwolf* (3 vols. 1848); and *Ruhe ist die erste Bürgerpflicht* (5 vols. 1852), may likewise be classed among the first specimens of the historical romance in the German language. He died in 1871.

HARINGTON, Sir JOHN, 1561–1612; queen Elizabeth's godson. He studied at Eton and at Christ college, Cambridge, where he took the degree of M.A., his tutor being bishop Still, the famous author of *Gammer Gurton's Needle*. He came to London about 1583 and studied law, but queen Elizabeth seems to have transferred him to a place at court. It is said that it was at her command that he translated Ariosto's *Orlando Furioso*, 1591. In 1596 he published in succession *The Metamorphosis of Ajax; An Apology;* and *Ulysses upon Ajax;* the three forming collectively a very absurd and indecorous work of a pantagruelistic kind. In 1599 he served in Ireland under Essex, and was knighted on the field, to the annoyance, it is said, of Elizabeth. In 1608 he wrote a personal satire against the bishops, which he read to James I., but which was first published, by a Presbyterian printer, as late as 1653, under the title of *A Brief View of the State of the Church*. In 1613 his *Epigrams*, which had circulated widely in MS., were printed in a collection of verses of various writers entitled *Alcilia*, and separately in 1615. They became very popular and were often reprinted. The miscellaneous writings of Harington were collected by the rev. Henry Harington in 1779, in 2 vols., under the title of *Nugæ Antiquæ*. The *Nugæ* includes some very elegant pieces of poetry of the poet's father. The translation of *Orlando Furioso* was a very important labor, and it was carried out with skill and perseverance. Harington, however, was neither a very exact scholar nor a very poetical translator. The *Orlando Furioso* was a sumptuous book, illustrated in the best taste of the day, and to it were appended a prose critique of the poem, and a life of Ariosto compiled from various Italian sources.

HARIRI, ABU MOHAMMED AL KASIM BEN ALI, a most celebrated Arabic philologist and poet, b. at Bassorah, on the Tigris, in 446 H. (1054 A.D.). Little is known of his life and circumstances save that he was the son of a silk-merchant (whence his name Hariri—*harîr*, silk). Hariri wrote several valuable grammatical works, and his lyrics are of a high order. But the most famous of all his writings, and indeed one of the most famous compositions of all times and countries, is his book entitled *Makamchs* (Sittings). This may best be described as a novel, or a collection of rhymed tales, loosely strung together, the center of which is always a certain Abu Seid from Seruj, who, witty, clever, amiable, of pleasing manners, well read in sacred and profane lore, but cunning, unscrupulous, a thorough rogue in fact, turns up under all possible disguises, and in all possible places—sermonizing, poetizing, telling adventures and tales of all kinds—always amusing and always getting money out of his audience. The brilliancy of imagination and wit displayed in these strange adventures, their striking changes, and dramatic situations, have hardly ever been equaled; but more wonderful still is the poet's power of language. The whole force of the proverbial fullness of expression, spirit, elegance, and grandeur of the Arabic idiom, Hariri has brought to bear on his subject. His work—of which one of the greatest Arabic authorities has said that it deserved to be written in gold—has indeed become the armory as well as the mind of all Arabic writers since his day. Poets and historians, grammarians and lexicographers, look upon the *Makamehs* as the highest source of authority, and next to the Koran, as far at least as language is concerned. His book has been translated either entirely or partially into nearly every eastern and European tongue, has been the prototype of innumerable imitations, the most successful of which is the one in Hebrew, *Tachkemoni*, by Jehuda Al-Charisi. The first complete edition of the text appeared in Calcutta, 1809–14, in 3 vols.; another by Caussin de Perceval, in Paris, 1818; one much more valuable, chiefly on account of its commentary by Silvestre de Sacy, appeared in Paris, 1821–22 (re-edited 1847–53).

The first (Latin) translations in European tongues of single Makamehs were made by Golius (1656) and Schultens (1731, etc.) But the palm of all translations is due to Rückert, who, with a power only inferior to that of Hariri himself, has so completely reproduced the spirit and form of the work in German in his *Verwandlungen des Abu Seid b. Serug*, first published in 1826, that the *Makameh* itself has become a favorite form for similar compositions in Germany. English translations, but which fall far short of the German one, were published in 1767 by Chapellon, and in 1850 by Preston. Munk and De Sacy have rendered some portions into French.

HARISCHANDRA, a Hindu king of the solar dynasty, a descendant of Ikshwâku, and one of the more prominent personages in the legendary history of ancient India. The earliest mention is made of him in the *Aitâreya-Brâhmana* (see VEDA), where he is the subject of one of the most interesting legends of the Vedic period. He is represented there as desirous of obtaining a son, and of making a compact with the god Varuna, by which he promised to sacrifice to the god his son, if he granted him one. Varuna acceded to his prayer, and the *Aitâreya-Brâhmana* then proceeds to relate how Harischandra delayed, from time to time, the fulfillment of his part of the compact, until at last he succeeded in finding a substitute for his son in S'unahs'epa, who was sold to him by his father for 100 cows, to be offered in sacrifice to Varuna. Ultimately,

however, S'uanahs'epa becomes released from his bondage through the intervention of the gods. (See S'UANAHS'EPA). According to the epic poem *Mahâbhârata*, Harischandra was a type of munificence and piety, and after death became elevated to the court of Indra; and some of the Purânas are still more explicit on his wonderful fate. Having given his whole country, his wife and son, and finally himself to Vis'wâmitra, in satisfaction of the demands made by this greedy priest for his assistance at a sacrifice, Harischandra, in consequence of this pious act, became elevated with his subjects to the paradise of Indra; but, having been insidiously misled by Nârada to boast of his merits, was again precipitated. The repentance of his pride, however, arrested his downward descent, and he and his train paused in mid-air, where his city is popularly believed to be at times still visible.—See Wilson's translation of the *Vishnu Purâna*.

HARIVANS'A, a Sanskrit epos of some extent, which professes to be part of the Mahâbhârata, but may be more properly classed with the Purânas. It is chiefly occupied with the adventures of Vishnu, in his incarnation as Krishna, but treats likewise of the creation of the world, of patriarchal and regal dynasties, and other matter contained in Purânas. Although it is frequently quoted by later writers, it is not a compilation of much reliability.—See PURÂNA.

HARLAN, a co. in s.e. Kentucky on the Virginia border, drained by Cumberland river; 500 sq.m.; pop. '70, 4,415—99 colored. The surface is hilly with extensive forests. Corn and pork are the main products. Co. seat, Harlan.

HARLAN, a co. in s. Nebraska bordering on Kansas, intersected by Republican river; 576 sq.m.; pop. '76, 2,140. The surface is undulating, and there is very little forest land; soil fertile. Co. seat, Alma.

HARLAN, JAMES, b. Ill. 1820; graduated at Asbury university, and took to the legal profession. He was superintendent of public instruction for the state of Iowa in 1847; in 1853 president of the Iowa Wesleyan university; from 1855 to 1865 U. S. senator from that state; in 1865–66 secretary of the interior, and again senator from 1867 to 1873.

HARLAW, BATTLE OF. From the beginning of the 12th c. to the beginning of the 14th c., the power and territory of the Celtic tribes in Scotland steadily gave way before the encroachments of the Anglo-Normans of the Lowlands. But during the long wars of the succession, and the feeble reigns of the first and second Stuart kings, the Celtic people regained so much of what they had lost, that, strengthened by alliances with England, they began to be regarded with alarm by the Scottish government. A trial of strength seemed inevitable, and it was precipitated by a dispute as to the right of succession to the earldom of Ross, between Donald lord of the Isles and a brother of the regent Albany. The island chief, gathering a host of 10,000 Islesmen and Highlanders, marched rapidly southwards, leaving havoc and desolation behind him. The rich city of Aberdeen, and the whole country to the n. of the Tay, seemed to be within his grasp, when he was encountered by a vastly inferior force of the chivalry and men at-arms of Mar, Garioch, Buchan, Angus and Mearns, under Alexander Stewart, earl of Mar, one of the best captains of the day, familiar in his youth with the usages of Highland warfare, and more recently distinguished in the wars of France and Flanders. The armies met on the eve of St. James (July 24), 1411, at Harlaw, a low table-land on the banks of the Ury, about 18 m. to the n.w. of Aberdeen. The battle was long and bloody, but the Highlanders were at last driven back. They left two chiefs—Maclean and Macintosh—and more than 900 dead upon the field. The loss upon the other side was computed at 500 or 600, among whom were the constable of Dundee, hereditary bearer of the royal banner, sir Alexander Irvine of Drum, and other knights, many of the best esquires of Angus and Mearns, nearly all the gentry of Buchan, and Robert Davidson, the provost, and many of the burghers of Aberdeen. So obstinate and sanguinary was the struggle, and so greatly were the Lowlanders outnumbered, that few of them escaped without a wound. The conflict made a deep and lasting impression on the national mind. For more than a hundred years, the battle of Harlaw continued to be fought over again by school-boys in their play. For more than two hundred years it was remembered in the music of the people. It lived still longer in their traditions; and it is not yet forgotten in their poetry. It is the subject of a still popular ballad, written, it would seem, towards the end of the 16th c., printed at least as early as 1668, reprinted in Allan Ramsay's *Evergreen* in 1724, and included in most subsequent collections of Scottish ballads. Scott, in his *Antiquary*, has commemorated "the sair field of Harlaw" in a fine fragment of song.

HARLAY, ACHILLE DE, 1536–1616; b. France, of an old and celebrated family. He was distinguished as a jurist, and succeeded De Thou (whose daughter was his wife) as president of the parliament of Paris. He wrote *La Coutume d'Orleans*.

HARLAY DE SANCY, NICOLAS, 1546–1629; b. France; superintendent of finances and ambassador under Henry III. and IV. D'Aubigné satirized him on account of his frequent change of religious faith; but he is best known as the owner of the large jewel called by his name—the Sancy diamond.

HARLEIAN COLLECTION, certain ancient pamphlets and manuscripts in the British museum, collected by Robert Harley, earl of Oxford, at the beginning of the

18th century. The collection (8,000 MSS. and 400,000 pamphlets) was bought by the government in 1723 for $50,000. Several volumes of selections from these papers have been published under the title of *Harleian Miscellany*.

HARLEM.—See HAARLEM, *ante*.

HARLEM, or HAARLAEM, now part of the 12th ward of New York city, but originally a separate settlement. Down to about 1760 it was a quaint Dutch village mainly of private residences, surrounded by gardens and farms, and noted for abundance of shade trees, and the sleepy quietness so quaintly described by Washington Irving in his *Knickerbocker's History of New York*.

HARLEM RIVER, a tidal stream from the East river around the upper or n. end of New York island, passing by a narrower channel called Spuyten Duyvil creek into the Hudson or North river, navigable, for a portion of its course, to large vessels.

HAR'LEQUIN, CLOWN, PANTALOON', and COL'UMBINE, the four chief personages in the modern Christmas pantomime. This species of play is divided into two parts—the one, the introduction, or opening; the other, the harlequinade. Both divisions of this kind of play, but particularly the opening, were wont to be acted in dumb-show, and at one time the same performers used to play all through the piece; the idea of which was a story of love, interspersed with grotesque elements. At a certain stage of the plot, a fairy was employed to transform the tyrant and his abettor into Clown and Pantaloon, and the lovers into Harlequin and Columbine; and the motley quartette were sent away for a period on a tour or chase, the termination of which took place at the will of the good fairy. During this chase, the object of the Clown ought to be the capture of Columbine; but Harlequin, who is provided by the fairy with a magic sword, the loss of which renders him helpless, is usually able to thwart all his designs, and protect his mistress. A symbolical meaning may, no doubt, be found at the bottom of such representations, at least in many of their parts; but as, in their modern form, they are a jumble of fragments from older scenic entertainments, anything like a consistent scheme is not to be looked for. As to the characters, the prototypes of the Clown and Harlequin may be traced back to the Roman Atellanæ (q.v.). The arlechino (Fr. *arlequin*) of the early Italian dramatic entertainments was a satirist and practical jester of a similar type to the modern English Clown. As civilization advanced, the character gradually became more refined, then was confined to the ballet, and at last disappeared from the regular stage. He still figures in the improvised plays of the Italians. In English pantomimes, the Clown is the prime mover in the "comic business;" and there are often two, the "talking" Clown, and the "tumbling" Clown, who acts chiefly as an acrobat. The Clown is also a never-failing adjunct in circus entertainments. Pantaloon is usually represented as a very senile old man, the butt of the Clown, and the aider and abettor of that person's comic villainy. This personage is knocked about and well cuffed by every one; he generally, therefore, wears a stuffed dress, in order to protect himself from accident. Columbine, the lover of Harlequin, has nothing to do all through the piece but to dress well, look pretty, and dance her best. The character of Columbine is usually represented by a well-trained dancer. Harlequin wears a tight dress sewn over with spangles.

The persons engaged in these occupations require to be trained to it from infancy. To make a good Clown or Harlequin (in the continental and original sense of the word) requires decided genius; and though the rôle may seem the lowest in the dramatic art, lasting European reputations have been obtained in it, as by the English clown, Grimaldi, and the famous French Carlin (1713–83).

HARLEQUIN DUCK, *Clangula histrionica*, a species of Garrot (q.v.), which receives its name from its variegated markings, chiefly white, gray, and black. It inhabits the arctic regions, where it is found, not only on the sea, but on lakes and rivers. It is a rare winter visitor of the British islands. In America it is pretty plentiful in winter as far s. as the bay of Fundy. Its whole length is about 17 inches.

HARLESS, GOTTLIEB CHRISTOPH ADOLF, D.D.; b. Germany, 1806; graduated at the university of Erlangen in 1829, and a few years afterwards became professor of theology in that institution. In 1842 he was in the Bavarian diet, and vigorously opposed the order requiring all persons in or connected with the army to kneel on the passing of the sacramental host. For this opposition he was removed from the university, but made a counselor of the consistory at Baireuth. Soon afterwards he was professor of theology at Leipsic, pastor and court preacher, and in 1852 was made president of the Protestant consistory at Munich, and a member of the Bavarian council of state. He has published a number of works on religious themes.

HARLEY, ROBERT, Earl of OXFORD AND MORTIMER, the son of sir Edward Harley, an active partisan of the parliament during the civil wars, and descended from an illustrious Herefordshire family, was b. in London in 1661. Harley entered parliament, being returned for the Cornish borough of Tregony, as a whig; but he soon began to vote and speak against his party; and policy and ambition, rather than choice, made him an anti-dissenter and an ardent tory. He shortly acquired a great reputation for his knowledge of parliamentary law and practice, a study not much pursued in those days; and in the parliament, which met under the chieftainship of Rochester and Godolphin,

in Feb., 1701, he was, by a large majority, elected speaker. Harley retained his post, having been twice re-elected, till April, 1704, when he became secretary of state. The conviction of Harley's secretary for treasonable correspondence with France caused his master, though entirely exculpated, to resign his office in Feb., 1708. Harley remained out of power two years, long enough, with the assistance of Mrs. Masham, to completely undermine the power of the whigs. In Aug., 1710, Godolphin was dismissed, and Harley was appointed to his post of chancellor of the exchequer, and brought back the tories. An event occurred in 1711, which raised Harley to the acmé of popularity. A French priest and spy, who assumed the title of marquis de Guischard, being brought before the council on Mar. 8, on the charge of treasonable correspondence with France, rushed upon Harley, and stabbed him with a penknife. His life was said to have been in danger, and recovering, he was congratulated by parliament on his escape, created earl of Oxford and Mortimer, decorated with the garter, and in the following May appointed lord high treasurer of Great Britain. From this point, Harley's course was downwards: he was not a man of business, and was destitute of that indispensable quality for a premier—decision of character. Macaulay had but a mean opinion of Harley as a statesman, yet he gives him, as a man, a higher character than could be given to any other politician of the time. The principal act of Harley's administration was the treaty of Utrecht: though England might have obtained better terms, she had nothing to gain from a continuance of the war; and the peace was, at all events, popular. Harley ceased to pay court to lady Masham, and the unscrupulous Bolingbroke succeeded in getting him dismissed on July 27, 1714. Lord Oxford was dismissed on Tuesday—Bolingbroke became premier—and the queen died on Sunday. George I. was proclaimed, and Bolingbroke fled to France, but Oxford remained to meet his fate. He was sent to the Tower, and after two years' imprisonment brought to trial: the two houses quarreled as to the mode of procedure, and the commons having in anger refused to take any part in the trial, he was acquitted by the peers, and released. He spent the remainder of his life in retirement—the friend of scholars and men of letters—the founder of a collection of books and MSS. which perpetuates his name—and died May 21, 1724.

HAR'LINGEN (Frisian, *Harns*), a flourishing seaport of the Netherlands, in the province of Friesland, on the Zuyder Zee, about 65 m. n.n.e. of Amsterdam. It is protected from the inroads of the sea by a strong and high dike. Principal buildings are the town-house and the great church. Harlingen has a grammar and a drawing school. There is a large shipping trade. Other industries are refining salt, tanning, soap-boiling, ship-building, making sail-cloth and brick. Timber, grain, and hemp are brought from Norway, and immense quantities of butter, cheese, flax, etc., are sent to England, from which in return are imported coal, iron, cotton, yarns, manufactured goods, etc. Pop. '75, 10,840.

HAR'MALINE AND **HARMINE** are vegetable bases occurring in the husk of the seeds of the *Peganum harmala*, or Syrian rue, a plant that grows abundantly in the steppes of southern Russia, and whose seeds are used in dyeing silk, to which they impart various shades of red. *Harmaline* ($C_{26}H_{14}N_2O_2$), when pure, crystallizes in colorless prisms; but its salts are yellow, and oxidizing agents transform it into a red coloring matter, which combines with acids, forming salts, which constitute the basis of the *harmala red* of commerce. *Harmine* ($C_{26}H_{12}N_2O_2$) may be obtained by oxidation from harmaline. It crystallizes in delicate prisms, and forms colorless salts.

The *Peganum harmala* belongs to the natural order *zygophyllaceæ*. It is a half-shrubby plant, with smooth linear pinnate or bipinnate leaves, and solitary white flowers. The seeds are said to possess narcotic properties, and the emperor Solyman is reported to have kept himself intoxicated by eating them. They are used by the Turks as a spice.

HARMAR, JOSIAH, 1753–1813; an officer in the war of independence, serving under Washington 1777–80, and in 1781 under Greene, becoming col. of the first U. S. regiment in 1783. He was the bearer to France of the notice of the ratification of the treaty of peace. Finally, after service as Indian agent, in 1789, he was appointed general-in-chief of the army of the new republic.

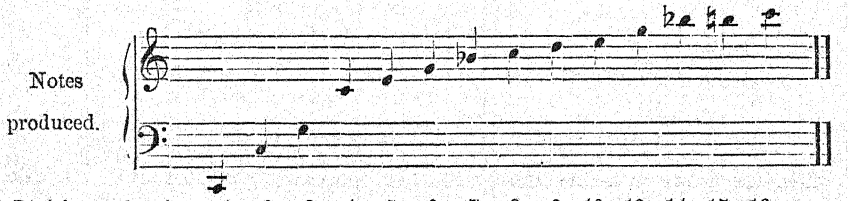
HARMAT'TAN, a dry hot wind, prevalent on the Guinea coast during Dec., Jan., and Feb., blowing from the interior to the Atlantic ocean. It is generally accompanied by a fog, through which the sun appears of a pale-red color. It has a hurtful effect on vegetation, and also unpleasantly effects the human body, drying up the eyes, nostrils, and mouth, and even causing the skin to peel off. It, however, has the good effect of checking epidemics, and curing dysentery, fevers, and cutaneous diseases. The harmattan is the same as the sirocco (q.v.) of Italy.

HARMO'DIUS AND **ARISTOGEI'TON**, two Athenians strongly attached to each other, who murdered (514 B.C.) Hipparchus, the younger brother of the "tyrant" Hippias, on account of an insult offered by him to the sister of Harmodius. They meant to kill Hippias also, with a view to the overthrow of the Pisistratidæ, but in this they did not succeed. Harmodius was cut down by the body-guard immediately after the murder of Hipparchus. Aristogeiton fled, but was afterwards taken and executed. As Hippias

was banished from Athens a few years later, Harmodius and Aristogeiton naturally came to be regarded as patriotic martyrs; and in this light they appear in all subsequent Greek history. They received divine honors from the Athenians, and had statues raised to their memory. A very beautiful drinking-song on this subject has come down to us in the Greek Scholia.

HARMONIA, wife of Cadmus, said to have been the daughter of Zeus and Electra, while her brother Iasion was the founder of the mystic rites which were celebrated annually on the island of Samothrace. When Cadmus came there, and was initiated, he received Harmonia as his wife. The gods honored the wedding with their presence; Athene presented the bride with a peplus and necklace; Electra gave the mystic rites of the mother of the gods. According to the scholiast on Euripides, Cadmus, with the aid of Athene carried off Harmonia; and in the mysteries, the lost Harmonia is regularly sought for. We have here an exact parallel to the Eleusinian legends. Electra and Harmonia are mere varieties of Demeter and Core. Cadmus like Pluto carries off the bright daughter of the goddess to the world below to spend there the dreary winter. Hence, in the Theban tale, Cadmus and Harmonia leave Thebes to go away among the Encheleis; the snake people are themselves changed into serpents, and are finally translated to the elysian fields. We then understand, too, why (according to Pausanias, ix. 16, 5) Cadmus dwelt at Thebes in the temple of Demeter Thesmophoros. The necklace, wrought by Hephæstus, which Harmonia received as a marriage gift, may be compared with the cestus of Aphrodite; for it is difficult to draw a line between Harmonia or Core and Aphrodite. Then it seems to be mythic representation of some phenomenon like the halo of dawn or the rainbow. Like the works of the German dwarfs, this necklace carried with it ill-luck, and the legends give it a history of woe. With it Polynices bribed Eriphyle to betray her husband Amphiaraus. It brought death at last to her son Alcmæon. Dedicated in the temple of Athene Pronoia at Delphi, it was given by the tyrant Phayllus (352 B.C.) to his mistress; her son going mad, set fire to the house, and she perished in the conflagration.

HARMONICS, the accessory, or concomitant sounds which are produced by a fundamental musical sound, either naturally, or by a division into aliquot parts. Every musical sound, although to the ordinary ear it appears to be only one sound, will, on close observation, be perceived to consist of a principal or fundamental sound, accompanied by other feeble acute sounds in perfect harmony (see HARMONY). The existence of such accompanying sounds, which are called harmonics, can be best demonstrated by the vibrations of a string stretched between two points, or bridges. Eight feet is a good length for such a string, although 16 ft., or even 32, would be better, from bridge to bridge. A scale or measure, accurately dividing the length of the string into aliquots parts, from $\frac{1}{2}$ up to $\frac{1}{16}$, is placed alongside of it. When a violin-bow is drawn across the string it vibrates from end to end, and gives out its fundamental sound. Divide the string into halves by slightly touching it with the finger at the mark $\frac{1}{2}$ on the scale, or better, with a stretched thread lightly pressed upon it at that point; when sounded, it will be found to vibrate in two halves, each part vibrating as fast again as the entire string, and producing a sound an octave above the fundamental one, or as 2 to 1. Divide in the same manner at $\frac{1}{3}$, and the sound produced is the fifth above the last octave, being in the proportion of 3 to 2. It is not necessary to touch the string on more than one of the points of the division, for the long side of the string always divides of itself naturally, which can be seen by the eye. The parts where the string seems at rest, are called the nodal points. Divide as before at $\frac{1}{4}$, and the second octave above the lowest sound is heard, being to the first octave as 4 to 2. At $\frac{1}{5}$ the major third above the last octave is found, being as 5 to 4. At $\frac{1}{6}$ the octave of the former fifth, 3 to 2. At $\frac{1}{7}$ we find the true flat seventh, or 7 to 4; at $\frac{1}{8}$, again the octave of the lowest; at $\frac{1}{9}$ the major second, or 9 to 8; and above this, at $\frac{1}{10}$, $\frac{1}{12}$, $\frac{1}{14}$, we find the octaves of the major third, the fifth, and the flat seventh; while at $\frac{1}{15}$ we obtain the sharp seventh, or 15 to 8; and at $\frac{1}{16}$ another octave of the fundamental sound. The following is the order in which the harmonics arise, assuming that the string, at its full length, sounds the note C on the second ledger line below the bass staff, or lowest string on a violoncello.



Divisions of string,	1	2	3	4	5	6	7	8	9	10	12	14	15	16
	C	C	G	C	E	G	B♭	C	D	E	G	B♭	B♮	C

From these harmonics, the true ratios of all the intervals of the diatonic scale, in relation to a fundamental key-note, are found, and in the most perfect tune; they are as follows:

Degrees of the scale	I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Notes of the scale	C	D	E	F	G	A	B	C
Ratios to key-note	1	$\frac{9}{8}$	$\frac{5}{4}$	$\frac{4}{3}$	$\frac{3}{2}$	$\frac{5}{3}$	$\frac{15}{8}$	$\frac{2}{1}$

Assuming 24 as the number of vibrations of C in any given time, the other notes of the scale may be expressed in whole numbers thus:

Notes of the scale	C	D	E	F	G	A	B	C
In whole numbers	24	27	30	32	36	40	45	48

In the artificial division of the octave into a chromatic scale of twelve equal semitones, all the intervals must necessarily be made somewhat imperfect, which is called temperament (see TEMPERAMENT). This must be especially attended to in keyed instruments. Singers, and performers on stringed instruments, are guided by their ear, being free from the fetters of fixed notes, to which keyed instruments are necessarily subject. Even in the natural diatonic scale as produced by the harmonics, it will be found, on analysis, that a certain degree of temperament is required to make the fifths within the octave equal. For example, the fifths from F to C, and from E to B, will be found to be accurately the same as the fifth from C to G—viz., $\frac{3}{2}$; which is easily ascertained by reducing their respective numbers to the lowest fraction; thus, F to C is $\frac{48}{32} =$ to $\frac{3}{2}$; from E to B is $\frac{45}{30} = \frac{3}{2}$; while from D to A, which in practical music must also be treated as a fifth, will be found to be too flat; thus, D to A is $\frac{40}{27}$, which cannot be reduced to $\frac{3}{2}$; but when both are brought to the fractions of a common denominator, which is done by multiplying $\frac{40}{27}$ by $2 = \frac{80}{54}$, and $\frac{3}{2}$ by $27 = \frac{81}{54}$, it is shown that D to A, in the scale of nature, is flatter than a perfect fifth, in the proportion of 81 to 80; so that without temperament A cannot at the same time be a perfect major sixth to C, as a key-note, and also a perfect fifth to D, the true major second of C.

HARMONICA, a musical instrument of a fascinating quality of sound, invented by Benjamin Franklin, the sound of which was produced from glass in the shape of a cup, or half globe, which was put into a revolving motion on its center, while the rim was touched by the finger. Franklin, in a letter dated July 13, 1762, to padre Baccaria, at Turin, mentions the history of his invention. It had already been known that beautiful sounds could be produced by friction of the finger on the rim of an ordinary drinking glass. An Irishman, named Puckeridge, was the first who hit on the idea of playing airs on a row of glasses, which he tuned by putting water into each. He performed publicly in London; but he and his glasses were burned in the great fire in London in 1750. When Franklin finished his invention, he found an excellent performer in a Miss Davis, to whom he made a present of his harmonica. Miss Davis, in 1765, performed on the harmonica in Paris, Vienna, and all the large cities of Germany with great effect. This fascinating instrument found many admirers, but none of them ever succeeded in improving it. The compass of its notes was from C to F, including all the chromatic semitones. The producing of the sound by the points of the fingers produced such an effect on the nerves of the performer as in some instances to cause fainting fits. All attempts to make the harmonica, through means of keys, easier for amateurs, ended in failure, as no substance was found to act as a substitute for the human finger, which doubtless imparted an expression to the sound which no dead substance could possess. The harmonica gave rise to a host of similar instruments by Chladini, Kaufmann, Rieffelsen, and others, which were not eminently successful. Other instruments of no merit or importance took the same name, but had not the most remote resemblance to the original. The harmonica was somewhat similar to the instrument now known as musical-glasses.

HARMONICA, CHEMICAL. This term is applied to the musical note which is evolved when a long dry tube, open at both ends, is held over a jet of burning hydrogen. A rapid current is produced through the tube, which occasions a flickering, and is attended by a series of small explosions that succeed each other so rapidly, and at such regular intervals, as to give rise to a musical note, whose pitch and quality vary with the length, thickness, and diameter of the tube. The explanation of this phenomenon, which was discovered by Lampadius, but long remained unaccounted for, is due to Faraday. A curious modification of the experiment is given by Böttger, in the 94th vol. of Poggendorff's *Annalen*, 1855.

HARMONIC PROPORTION. Three numbers are said to be in harmonic proportion when the first is to the third as the difference between the first and second is to the difference between the second and third, otherwise harmonic proportion is that which subsists between the reciprocals of numbers which are in arithmetical proportion. Thus, 3, 5, 7, etc., being in arithmetical proportion, $\frac{1}{3}$, $\frac{1}{5}$, $\frac{1}{7}$, etc., are in harmonic proportion. In geometry, a line AB is said to be harmonically divided when two points

A C B D

are taken, one in the line, and the other in the line produced, as C, and D; such that AC: CB:: AD: DB. When the line is thus divided, AD, CD, and BD, are in harmonic proportion. A harmonic progression is a series of numbers in harmonic proportion, as the series formed by the reciprocals of numbers forming an arithmetical series.

HARMONIC STOPS designate those stops of a large organ which are composed generally of more than a single rank of pipes, tuned in octaves, double octaves, and double or triple thirds and fifths above the natural pitch of the keys; they comprise the mixture, furniture, cornet, etc. Harmonic stops which have only a single rank of pipes tuned in thirds, fifths, with their octaves above the pitch represented on the key-board, are called "mutation stops." They were introduced to give additional power to the "foundation stops," and also to produce a more brilliant effect in the performance of certain styles of music.

HARMONISTS, a sect founded at Würtemberg by George and Frederick Rapp about 1787. The points of belief of the sect, as finally elaborated, are these: Adam was created a dual being, having within his own person both the sexual elements, and the Creator is of the same dual nature; if Adam had been satisfied to remain in his own original race he would have increased without the aid of woman, and brought forth beings like himself, but he became discontented, and then the Creator separated his twofold nature, of the female element making woman to gratify Adam's desire, and therein consisted the fall of man; that the condition of celibacy is the most pleasing to God; that in the renewed world man will be restored to his dual God-like and Adam-like condition; that the coming of Christ and the renovation of the world are near at hand; that we should be in constant readiness for this reappearance; that Jesus was of a dual nature, like Adam before the fall; that Christ taught a community of goods; that ultimately all mankind will find salvation;—but only those who are celibates, and otherwise conform to what they believe to be the commandments of Jesus, will be at once received into the company of Christ and his companions, and that offenders must undergo a probation for purification. They positively reject what is called spiritualism. The early members were so much harassed by petty persecutions, chiefly from the regular churches, that in 1803 they determined to emigrate, and came to Pennsylvania and Maryland. In 1805 they were firmly and prosperously established at Harmony, Butler co., Penn., where they remained ten years. Then they migrated to New Harmony, Ind., remaining there until 1824, when they sold their land to Robert Owen, the socialist, and returned to Pennsylvania, establishing themselves at Economy, Beaver co., 17 m. n.w. of Pittsburg. Here they have grown in wealth and decreased in numbers, for they have of late years sought no accessions. There are probably not more than 100 in the neat little village, and nearly all are old men. The German language is still used. They have much property in real estate, in coal mines, and they control, at Beaver Falls, the largest cutlery manufactory in the country.

HARMO'NIUM, a musical instrument of modern invention, for which there are many claimants. The principle by which the sounds of the harmonium are produced, is called the *free vibrating reed*, supposed to have been a modern discovery, but now ascertained to have been known in China long before it was ever heard of in Europe. Its construction is as follows: A narrow rectangular slit being made in a piece of brass plate of a quarter of an inch in thickness, a thin elastic spring of the same metal, and of nearly the exact breadth of the slit, is fixed at one end by two small rivets to the surface of the plate, close to one end of the slit, being so adjusted as to fill the area of the slit, and that when pressed into it at the free end it may pass inwards without touching the end or the sides of the slit, and when left to itself it shall return back to its position of covering the slit. The spring at the free end is permanently bent a very little outwards. When a current of air is forced through the slit, the spring is put into vibration, and produces a continuous musical sound, acute or grave, according to the rapidity or slowness of the vibrations. This kind of reed is termed "free," in contradistinction to the reed of the organ-pipe, the spring or tongue of which entirely covers an oblong slit, in the side of a brass tube closed at one end, and vibrates against the cheeks or outside of the slit, instead of within it. After many attempts, in various countries, to construct a keyed instrument of really a useful kind with the free reed, Debain of Paris produced his invention of the harmonium, which became more or less the model of all the others that have followed. The harmonium occupies comparatively but little space, being only about 3 ft. 3 in. high, and 3 ft. 9 in. broad; the depth being according to the number of the stops. It has a compass of five octaves of keys from C to C, the key board being placed on the top, immediately below the lid. Under the key-board is the wind-box, on which are valves for each key; while below the valves, and inside of the wind-box, the different rows of reeds are placed. The sizes of the reeds differ, according to pitch, from about 3½ in. long to ¼ in.; and the quality of sound is affected and modified by the breadth of the vibrating part of the reed, and the shape of the aperture in the wind-box covered by the valve. The pressure of wind is from a bellows with two feeders, which the player moves alternately with his feet, filling a magazine, similar to the bellows of a small organ. When a key is pressed down, the valve below it opens, and the wind, which has access from the bellows to the wind-box, rushes through the slit of the reed, and produces a sound which continues while the valve is kept open. It is a peculiarity of the free reed that an increase or diminution of the pressure of wind does not alter the pitch of the sound, but merely increases or diminishes its volume. Advantage is taken of this peculiarity to effect, in the harmonium, a beautifully expressive swell, or diminution in the sound, by gradually increasing or

diminishing the pressure of the wind. The vibrations of the spring being like those of a pendulum, isochronous, remain fixed in rapidity or slowness, according to the length and elasticity of the vibrating slip of metal, and thus regulate the pitch of the sound without reference to the pressure of wind. For the deep bass-notes the springs are heavily loaded at the loose end, to make them vibrate slowly; while in the higher notes they are made thinner at that end. Harmoniums are made of various sizes, and from one row of reeds (or vibrators, as they are now called) to four or more rows; each row is divided near the middle, between an E and F; and each half has its separate draw-stop. Lately, a "knee" movement, erroneously called a pedal, for producing a small degree of crescendo on either bass or treble, has been attached. Some harmoniums are made with two rows of keys, thus affording a greater variety in playing solo with an accompaniment; and for more skillful performers, pedal-keys for the feet, like those of a church organ, are added. The manufacture of the harmonium in Paris has, of late years, increased almost incredibly. The various parts of the harmonium can now be got made there, and furnished from a single reed to a complete set. Many attempts were formerly made in England to accomplish the making of a similar instrument called the seraphine, but it was a much inferior instrument, although more expensive. Even now, the harmoniums said to be made in this country, are all got piecemeal from Paris, and put together in London. The best makers in Paris are Debain and Alexandre; and in Germany, Schiedmayer of Stuttgart, and Kaufmann of Dresden. The latter is the inventor of the *percussion action* for the harmonium, which consists of a small hammer like that of a pianoforte, which strikes a blow on the vibrator the moment the key is pressed down, and sets it instantly into vibration, thus assisting the action of the wind. Harmoniums may now be had of various sizes and qualities, at prices from £5 to £50. Valuable chiefly for accompanying psalmody, they suitably take the place of organs in temporary places of public worship, or among the less opulent class of congregations. For domestic use, they are not likely to supersede the pianoforte, but possessing the important advantage of not going out of tune through humidity of atmosphere, they will be found available where pianos cannot properly be kept.

HARMONY (Gr., a joining or fitting of pieces into one another), in Music, is understood to be the union of sounds which individually appear different, but when heard together, form a collective sound called a chord (see CHORD); or it may be explained as the melting or flowing together of several sounds into, as it were, one sound; in consequence of, or arising from, the consonant nature of their relative proportions to a fundamental sound. All musical compositions can be reduced to a fundamental harmony of successive chords, which, in their progression, are regulated by the rules of the theory of music. Dissonant as well as consonant, chords are included as forming harmony, as they are a union of several sounds that have but one fundamental sound, or bass note, in common. The harmony of chords can either be close or spread, which the position or distance of the sounds or intervals from one to another, forming the chords, determines. Close harmony is when the sounds composing each chord are placed so near to each other, that no sound belonging to the chord could again be interposed between any of those already present. Spread harmony is when the sounds of a chord are placed at a greater distance from each other, so that some of them might be again interposed between the parts of those sounds already present. Close harmony generally takes place in music in which there exists a near relationship among the different parts, as in compositions for four male voices, in which case it becomes unavoidable, and spread harmony impossible. In choruses for mixed voices, and in instrumental compositions, spread harmony is more used, and the intervals of the chords are frequently inverted, which produces what is called double counterpoint (q.v.) In the inversion of intervals, great care must be taken to avoid a consecutive progression of such intervals as become fifths by inversion; also that an alto part should never approach nearer a bass part than the distance of an octave. Close and spread harmony are often mixed, in order that individual parts may become more melodious and easier to sing, as well as to prevent unpleasant or abrupt skips in the melody; or to avoid an equally faulty monotonous formality of movement.

Although it has been said that every chord, whether consonant or dissonant, forms harmony, it must not be understood that any combination of sounds which one may choose to sound together is harmony. A dissonant chord treated as harmony is always judged of according to the nature of its different intervals, of which there are often some that are treated as dissonances, although they are fundamentally consonances, only more or less imperfect. All harmony in music is derived from what are called the aliquot tones. When a string is made to vibrate, we at first think that we only hear one sound; but on closer and more careful observation, we easily discover that the fundamental sound, particularly when it is a deep one, is accompanied by others in the most perfect harmony. The accompanying sounds are exactly those of which the chords in music are formed, and on which the foundation of the whole system of harmony in music is built. From the mathematical proportions and the relations of the accompanying sounds to the fundamental or principal sound from which they all arise (see HARMONICS), it follows that harmony, in its first and natural state, can only be in four parts and it is then called perfect, or complete; in opposition to harmony of two or

three parts which cannot be complete, as some of the intervals of the chords, essential to characterize the key or scale, may be awanting. A four-part harmony may be so arranged that five, or even more parts may appear, by means of doubling one or more of the intervals in the octave. From this increasing of the parts arises what is called the subordinate harmony, accompanying the principal or fundamental. In order to avoid faulty progressions in the subordinate harmony, care must be taken to strictly observe the rules which apply to the intervals in their fundamental state. The purpose of the subordinate harmony is only that of ornamenting the original, which the Germans call *figurirung*, commonly called figured harmony, but should be more properly called florid counterpoint. If it be admitted that the intervals and chords that are most consonant are also most harmonious, it naturally follows that the union of similar sounds must be the most perfect, therefore the order of perfection in which they rank must arise from their mathematical proportions in relation to the fundamental sound or unison. The common chord of a third, fifth, and octave to a bass note is the most pure and perfect harmony; after which follow the chord of the seventh, and the chord of the ninth. The inversions of any of these chords are all in various degrees less perfect than their original fundamental harmony. The position of the intervals in respect to the fundamental note is also an element in the purity of chords; as, for example, a chord of the seventh in close harmony, is far less satisfactory and pleasing than it is in spread harmony, where the different intervals are at, or near, their natural distances from the fundamental note. Such considerations are of great importance to the musician who has to accompany from a figured bass; and also to organ-builders in arranging the composition of mixture-stops. Harmony in modern music, is therefore a succession of chords according to certain laws. In the early ages of the science, the laws of harmony were most arbitrary. Nature presents us with solitary chords, but she does not establish their succession. A collection of chords is not music, any more than a collection of words is a speech. Music, like a discourse, must also have its phrases, periods, punctuation, etc., and all in harmony. The most useful works on harmony are those of Dr. Marx, professor Dehn, and Dr. Fred. Schneider.

HARMONY OF THE **GOSPELS.** The narratives of the evangelists, and especially those of the first three, are in many things close repetitions of each other, and not unfrequently relate the same incident in words which are all but identical. On the other hand, they occasionally exhibit seemingly grave discrepancies, whether of facts or of circumstances; one relating an occurrence not noticed by another, or placing an occurrence at a time or in circumstances which it is hard to reconcile with the narratives of his brother-evangelists. At a very early period of Christian literature this difficulty was felt, and with a view to its more complete and easy elucidation, the passages of the several gospels which bore upon each subject or incident were collected for the purpose of comparison and of mutual illustration. The title under which the earliest compilation of this nature, which dates from the second half of the 2d c., was known was *Diatessaron*, because it consisted of extracts from the *four* evangelists. The author of this compilation was the heretic Tatian, and it is remarkable that, in order to give a color to his own peculiar opinions as to the unreality of the flesh of our Lord, he omitted from his collection the entire history of the birth and childhood of Jesus as related by Matthew and Mark (Eusebius, *Eccl. Hist.* iv. 29). St. Jerome states that a similar harmony was compiled about the same time by Theophilus of Antioch, although no trace of such a work is now discoverable; but in the middle of the following century the celebrated Neo-platonist convert, Ammonius Saccas, undertook a new *Diatessaron*, which formed the basis of the well-known *Ten Indexes*, or canons, of the Harmony of the Gospels, in the Greek text, by Eusebius, which were afterwards adapted to the Latin text by St. Jerome, and continued to be used as a key to the concordance of the gospels by readers both of the Greek and of the Latin text, down to the 16th century. The canons of Eusebius consist of ten tables. Of these, the first, which contains four columns, exhibits all the passages which are common to the four gospels; the second, third, and fourth contain three columns, and show the passages which are found in any three of the gospels; the fifth, sixth, seventh, eighth, and ninth are in two columns, and show the passages which occur in any two of the gospels; and the tenth contains the passages which are found only in one of the gospel narratives. The convenience and utility of such a scheme are at once apparent, and it has led in later times to the numerous and useful compilations, Roman Catholic as well as Protestant, known under the name of Synopses of the Gospels, the best and most popular of which are enumerated by Tischendorf in the introduction to his own *Synopses Evangelicæ*, p. 9, and foll.

HARMONY OF THE **SPHERES.** Many of the ancients supposed the motions of the stars and planets to produce a kind of music, which they called the harmony of the spheres. They attributed this music to the various proportionate impressions of the heavenly bodies on one another acting at proper intervals. Kepler wrote a work on the harmonies of the world, and particularly of the celestial bodies.

HARMS, CLAUS, a distinguished German divine, was b. May 25, 1778, at Fahrstedt, in South Ditmarsch. In 1797 he went to the gymnasium at Meldorf, and in 1799 to the university of Kiel. The rationalism of the time, in which he had been to some extent

educated, failed to give him satisfaction; and Schleiermacher's *Reden über die Religion* at last settled his faith. After supporting himself as family tutor from 1802 till 1806, he was appointed dean of Lunden, in Northern Ditmarsch, whence he was called, in 1816, to Kiel, as archdeacon and afternoon-preacher in the Nicolai-kirche. Next year, shortly before the tricentenary of the reformation in Germany, he issued, in defense of Protestant orthodoxy, 95 theses under the title, *Das sind die 95 Theses oder Streitsätze Dr. Luther's.* These produced a deep impression throughout Germany, and brought him a call to be bishop of the consistory about to be instituted for the Protestant church of Russia. This, as well as a call in 1834 to succeed Schleiermacher in Trinity church, Berlin, Harms refused. In 1835 he was made chief pastor and provost in Kiel, but was compelled to resign, in consequence of an attack of almost total blindness. The rest of his life was spent in retirement, devoted to literary activity. He died Feb. 1, 1855. Harms's published works are chiefly sermons, which may be reckoned among the best specimens of modern pulpit eloquence in Germany. Of these, the most famous are his *Winterpostille* (1808, 6te Aufl. 1846) and *Sommerpostille* (1815, 6te Aufl. 1846), to which a new series was added—*Neue Winterpostille* (1826) and *Neue Sommerpostille* (1827).—On Harms's life may be consulted Dorner's *Blätter der Erinnerung an das Jubiläum von Harms* (1842), and *Harms's Lebensbeschreibung verfasst von ihm selbst* (1851).

HARMS, Ludwig, 1809–66; b. at Hermansburg, Prussia. He was educated at Göttingen, and became assistant to his father, who was pastor in his native town. He brought the parish speedily into a revived condition, and built a missionary college, not directly soliciting money, but depending upon answers to prayer for all his needs. He gathered a class of students, built a ship, and sent her on a missionary voyage Oct. 18, 1853. In 1854 he established a printing press and a journal of missionary intelligence, which soon attained a circulation of 14,000 copies. He established an annual missionary festival, held in June in the open air, and attended by thousands, including strangers from all parts of Europe. He preached in a church edifice nearly 1000 years old, preserved partly because of its antiquity, but crowded to its utmost limits during two Sunday services, each of nearly four hours. He held also a third Sunday service, in the low German tongue, in his parsonage at night. While continually writing for his missionary journal, he published many books and kept up an enormous correspondence with his missionaries. With many eccentricities of personal conduct, he carried on a work of unparalleled activity with a most devout self-consecration, preaching sitting when at length too weak to stand. His parishioners loved him with a personal affection that was unanimous and without bounds.

HARNETT, a co. in central North Carolina, intersected by Cape Fear, South, and Little rivers, and the Western North Carolina railroad; 550 sq.m.; pop. '70, 8,895—3,038 colored. The surface is hilly, and much is covered with forests. Corn, cotton, and pork are the chief products. Co. seat, Lillington.

HARNETT, Cornelius, 1723–1781; b. England; in early life settled in North Carolina. He was a member of the colonial assembly, and one of the prominent leaders in legislation. When the revolution began he was among the most zealous and active friends of independence of the colonies. He was a member of the provincial congress, and on the committee to draft a state constitution, and when in the continental congress he was one of the signers of the articles of confederation. He was a prisoner to the British at the time of his death.

HA'RO, a small t. of Spain, in the province of Logroño, and 26 m. w.n.w. of the town of that name, is prettily situated in a fertile plain on the right bank of the Ebro. It has manufactures of hats, leather, brandy, and liquors. Much wine is grown in the neighborhood. Pop. 6,000.

HARO, Alonzo Muñez de, s.t.d., 1729–1800; b. Spain; studied in the university of Bologna, where he became rector, and professor of sacred literature. In 1770 he was sent out as archbishop of Mexico, where he was famous for his eloquence. He made some valuable presents to St. Peter's church in New York, and it is said that he founded a Roman Catholic free school in that city.

HAROERIS, the elder Horus, son of *Seb*, the Egyptian Saturn, and *Nu*, or Rhea, said to have been born on the second day of the epact. He was the brother, and not the son, of Osiris, from whom he is to be distinguished. In the inscriptions, he is said to be the son of Atum, of Ptah or Vulcan, and Athor or Venus, according to different legends. He was also lord of the south and Nubia, and particularly ruler over the heaven, illuminating the world with the brightness of his eyes. As such, he was identified with the sun and Apollo, and represented as hawk-headed, wearing the crown of the upper and lower world. His name is also found in the Greek dedications to him of the temples of Ombos and Apollinopolis Parva. His connection with the sun is, however, undoubted, as he is made on one inscription a child of the sun, and type of Mentu Ra or Mars. The festival of his eyes, which mythically represented the sun and moon, took place on the 30th Epiphi.—Birch, *Gallery of Antiquities*, i. p. 36; Wilkinson, *Manners and Customs*, iv. p. 395.

HAROLD I. (1035–1040), (surnamed Harefoot, probably on account of his swiftness in running), was the younger of Canute's two sons, by his first wife Alfgiva. According

to agreement on Canute's second marriage, his son by Emma was to inherit the English as well as the Danish throne: this son, Hardicanute, was, however, in Denmark at the time of his father's death, and being very unpopular with the Danish part of the population in England, lost half of his kingdom. Leofric, earl of Mercia, led the cause of Harold, while the powerful earl Godwin espoused that of Hardicanute. Civil war was happily averted by a compromise, and the kingdom was divided. Harold took London, with all the provinces n. of the Thames; while the possession of the south was given up to Emma for Hardicanute, who fixed her residence at Winchester, and established her authority over her son's share of the partition. In 1037 the thanes and people of Wessex submitted to Harold, and he was crowned king of all England, though it is stated that the archbishop of Canterbury, Egelnoth, at first refused to perform the ceremony himself, or to allow any of his brother-bishops to do so. He died at Oxford, Mar. 17, 1040.

HAROLD II. was the second son of the powerful Godwin, earl of Kent, and was b. at the close of the 10th century. On the death of Edward the confessor, the witenagemôte (q.v.), in the exercise of its rights, set aside the claims of Edgar Atheling, and, ignoring the reputed bequest of the late sovereign in favor of the duke of Normandy, elected Harold to fill the vacant throne. Duke William immediately asserted his claim, which was supported by Harold's brother Tostig and Harold Hardrade, king of Norway, for the sake of obtaining the duke's assistance to reinstate the former in the government of Northumbria. Tostig and the king landed on the coast of Yorkshire, and after defeating Morcar and Edwin, earls of Northumbria and Mercia, advanced to York, but were met by Harold at Stamfordbridge, and totally routed. Three weeks afterwards, William landed in England; the contending armies met at Senlac, about 9 m. from Hastings, where Harold's death (Oct. 14, 1066) made the duke of Normandy undisputed ruler of England.

HAROLD, King of Norway. See HAROLD, *ante.*

HAROLD'S-CROSS, a village-suburb of Dublin, situated on the Grand canal, 3 m. south-by-west from the center of the city, and now included in Rathmines and Rathgar township. It is built nearly in the form of a square, within which lies a spacious green, anciently the scene of periodical village festivals. It is the seat of a cotton-factory; and although the village is poor, there are many handsome villas in the vicinity, as also the handsome cemetery of Mount Jerome. Harold's-Cross also contains two convents of nuns, to which are attached free schools for the female children of the village.

HAROUN AL-RASHID. See HARÛN, *ante.*

HARP, a musical stringed instrument, much esteemed by the ancients. In Egypt, the figure of the harp is found delineated from the earliest ages in many different forms, some of them very simple, and others with great taste and ornament; some played on while standing, others while kneeling. The Celtic bards held the harp in the greatest honor. In the Highlands of Scotland the instrument has disapppeared, but it is still in use in Wales, and to some extent it lingers in Ireland, where, from its former prevalence, it is adopted as a national symbol. The old Franks and Germans punished those severely who injured a harpist in the hand. The harp was used as an accompaniment to the psalms sung by the early congregations of Christians. There are three kinds of harps now known—the ordinary Italian harp, which is strung with two rows of wire-strings, separated by a double sounding-board; this kind is now little used, being very imperfect. The double harp, or, as it is also called, David's harp, is a more useful instrument, and in the form of a triangle, with a sounding-board and gut-strings; it is always tuned in the principal key of the music, while the strings are altered to suit any modulations out of the key, by pressure of the thumb, or turning the tuning-pins of certain notes. These defects led gradually to the invention of the pedal harp, which has seven pedals, by which each note of the diatonic scale, in all the different octaves, can be made a semitone higher. The compass of the pedal harp is from contra F to D of the sixth octave above. In order to have the B flat, it must be tuned in the key of E flat. The music for the harp is written in the bass and treble clef, the same as pianoforte music. A celebrated harpist, Hochbrucker, in Donauwörth, invented the pedals in 1720; others say they were invented by J. Paul Velter, in Nuremberg, in 1730, who at least added the piano and forte pedal. After numerous attempts at further improvements, the harp at length reached a degree of perfection by the invention of the double-action pedal harp by Erard in Paris, which scarcely leaves anything more to be desired. By means of Erard's invention, each string can be sharpened twice, each time a semitone; so that the C string may be C flat, its full length, C natural by the first movement of the pedal, and C sharp by the next movement. The double-action harp is tuned with all the pedals half-down, and in the key of C natural.

HARPALUS, one of the youthful associates and cousin of Alexander the great. Phlip banished him 337 B.C. for endeavoring to secure the marriage of Alexander; but the latter recalled him and made him chief of the treasury in the expedition to Asia. He became a defaulter, but was pardoned; was satrap of Babylon, and, on account of his dissipated conduct, was imprisoned at Athens, whence he escaped and fled to Crete, where it is supposed he was murdered.

HARPE, JEAN FRANÇOIS DE LA, was b. at Paris, Nov. 20, 1739, studied at the collége d'Harcourt, and led for some time a rather checkered life. In 1762 he published a volume of juvenile poems, and in the following year his tragedy of *Warwick* appeared: it was very successful on the stage, and placed to his account both fame and money. Excepting the *Lycée*, this is by far the best of his works, though the writing has but little force. Grimm has admirably characterized the play as "*le coup d'essais d'un jeune homme de soixante ans.*" La Harpe's three subsequent plays, written in the same vein, *Timoléon*, *Pharamond*, and *Gustave Wasa*, entirely failed. The work that preserves his name, and has given him a permanent position among the literati of France, is his *Lycée ou Cours de Littérature*, which, in default of a better, has till lately been their only reliable work of *haute critique*. That portion which relates to ancient literature is of little value, and that in which the author treats of contemporary writers is entirely worthless, owing to the bitterness and pride of the critic, who could see nothing great or good in the works of a rival or fellow-laborer. The intervening portion is, however, of great value to the student, giving, for the time, a complete critical history of French literature. The book will also be found serviceable to the student of the language. At its commencement, the revolution found no more ardent admirer than la Harpe; but when he was cast into prison—where he is said to have been converted to Christianity by a fellow-captive, the bishop of St. Brieux—for refusing to countenance the extremes to which democracy was leading, his views entirely changed, and he became a firm supporter of church and crown. La Harpe died Feb. 11, 1803.

HARPER, a co. in s. Kansas, bordering on the Indian territory; 1000 sq.m.; pop. about 1500. The surface is level, and there is not much timber. Co. seat, Harper.

HARPER, ROBERT GOODLOE, LL.D., 1765–1825; b. Va. At the age of 15 he was a trooper in Greene's campaign. Soon afterwards he entered the college of New Jersey, and graduated in 1785. He was in the state legislature, and from 1794 to 1801 in congress, where he was among the leaders of the federalists. Harper was for several years eminent among Baltimore lawyers, and made a remarkable defense of judge Samuel Chase, who had been impeached on partisan grounds at the instance of John Randolph. He was elected to the U. S. senate in 1815. A few years later he traveled in Europe. He published a number of essays and addresses, chiefly on political topics.

HARPER & BROTHERS, the name of the largest publishing house in America. From 1825–69 the firm consisted of four brothers; James Harper, 1795–1869, died from injuries received by being thrown from his carriage; was elected mayor of New York city in 1844. John Harper, 1797–1875; Joseph Wesley Harper, 1801–70; Fletcher Harper, 1806–77. The firm now consists of five sons and one grandson of the original members. In 1817 the two elder brothers, after having completed their apprenticeship, commenced business as printers and publishers in New York under the name of J. & J. Harper. The two younger brothers entered their employ, and in 1833 the firm-name was changed to Harper & Brothers. Their establishment became too small for their increasing business, and in 1850 they erected a large and commodious structure on Franklin square, in Pearl street. They had scarcely moved into this when the fire of Dec. 10, 1853, occurred, destroying the entire building, and involving a loss of fully a million dollars. They at once set about erecting a handsome fire-proof structure, on a larger scale, upon the same site. Besides a large catalogue of valuable books, they publish *Harper's Magazine*, *Harper's Weekly*, *Harper's Bazar*, and *Harper's Young People*.

HARPER'S FERRY, a t. in Virginia, U. S., at the confluence of the Shenandoah with the Potomac, where the latter passes through the Blue Ridge of the Alleghanies, 53 m. n.w. from Washington. Its fine scenery has been celebrated by Jefferson in his *Notes on Virginia*. The Baltimore and Ohio railway here crosses the Potomac. It is the site of a government foundry, armory, and arsenal, which were destroyed and abandoned by the U. S. troops at the beginning of the civil war; and has since witnessed various struggles. It was also the scene of John Brown's abolition raid in Virginia, 1859. Pop. 2,500.

HARPER'S FERRY (*ante*), formerly occupied by the U. S. government, as an arsenal and depot of military stores, was the scene of the attempt of John Brown to start a revolution in the southern states (see BROWN, JOHN), and in the rebellion was among the first places to experience armed collision. In April, 1861, the confederates drove out the handful of union soldiers left to guard the arsenal; but in June the confederates retired, after destroying the bridge, the armory, and the arsenal. In 1862 the confederates again took possession, capturing nearly 12,000 prisoners. After the battle of Antietam the union forces regained the place and held it throughout the war. The pop. is now about 2,500. Harper's Ferry is the seat of Storer college.

HARPOCRATES, the name given by Greek writers to the younger Horus, the hieroglyphical inscriptions calling him *Har pa khrut*, "Horus the child," the son of Isis. See HORUS. According to the legend, he was a younger son of Osiris and Isis, who, having placed an amulet round her neck, gave birth to him at the winter solstice. He is described by Plutarch as lame in the lower limbs when born, to indicate the weak and tender shootings of corn. He is represented as a child wearing the skull-cap or *pschent*, the crown of the upper and lower world, and holding in his hands the whip

and crook, to expel evil influences. At the right side of his head his hair is gathered into a single lock, and his finger is placed on his mouth, an action indicative of youth, and mistaken by the Greek and Roman writers for that of silence, of which they made Harpocrates the divinity. Sometimes he wears an amulet in shape of a vase round his neck. The temple at Edfou or Apollinopolis Magna was dedicated to him, and in the sculptures he symbolizes the sun in the earliest hours of the day. He has generally been considered to be the winter sun, but rather represents the feeble and nascent sun of the later mythology. Lions were placed under his throne; cynocephali are said to be dedicated to him, probably from confounding him with the lunar god Khons; and the lotus, on which he is often depicted sitting, and which was thought to be open at sunrise and close at sunset, was particularly sacred to him. So was the Persea, or *Cassia Fistularis*. His worship was introduced as part of the Isiac cult into Rome, and he was supposed to be very efficacious in giving dreams; an edict of the people being, however, directed against it in the consulship of Gabinius. In the consulship of Piso and Gabinius his worship was driven from the capitol; but he was very popular in the days of Pliny. Although the name of Harpocrates is not mentioned earlier than Eratosthenes, yet as he mentions it as part of that of an ancient monarch, it was undoubtedly of high antiquity.

Birch, *Gallery of Antiquities*, i. p. 37; Wilkinson, sir G., *Mann. and Cust.*, iv. p. 405; Iablonski, *Pantheon*, i. p. 241.

HARPOCRATION, VALERIUS, a grammarian of Egypt, respecting whose personal history nothing is known. Some have considered him to be the Greek instructor of the emperor L. Verus, mentioned by Julius Capitolinus, while others have made him live so late as A.D. 360, because several passages are found in his works taken from Athenæus, who is supposed to have flourished about A.D. 300. Harpocration is the author of a very valuable lexicon on the ten orators, which contains a great deal of information on the law, history, antiquities, and general literature of Athens. The value of this work is much enhanced by the fact that all the authorities from which it has been compiled are lost. Harpocration is also the author of a work entitled *Collection of Flowery Extracts*.

HARPOON', the weapon with which whales and other large cetaceans are killed. See WHALE.

HARP SEAL, in commercial value the most important of the family of seals, frequenting the coasts of North America on the Atlantic, also Greenland, north Europe, and Asia. Great numbers are caught off Newfoundland. The skin is valuable, and the carcass yields excellent oil. It receives its name from peculiar marks on its back, resembling the shape of a harp.

HARP-SHELL, *Harpa*, a genus of gasteropodous mollusks of the whelk family (*buccinidæ*), having the last whorl of the shell very large, the shell ribbed longitudinally, the foot of the animal very large. The species, which are not very numerous, are found in the seas of warm climates, and particularly at the Mauritius. The shells are much prized for their great beauty, but must be kept in drawers, and not exposed to light, or their delicate and brilliant colors will fade.

HARP'SICHORD, a keyed musical instrument, formerly in extensive use, but now little known. In shape it was exactly like a grand pianoforte, to which its internal arrangements were also similar. The sound from the strings was produced by a small piece of crow-quill, or a piece of hard leather, which projected out of a slip of wood, called the jack, that stood upright between the strings, and was pushed upwards by the key, till the quill, or leather, twitched the string, causing a brilliant, but somewhat harsh sound, entirely deficient of any means of modification, in respect to loudness or softness. Specimens of the harpsichord, although now becoming more rare, are still to be found in good preservation, but rather as articles of vertu or curiosity, than as useful musical instruments. Many Italian and Dutch harpsichords were highly ornamented by the most eminent artists with valuable oil-paintings on the inside of the lid. The date of the invention of the harpsichord is uncertain. Before the 15th c., there is no trace of its existence. It was introduced into England early in the 17th century. In the 18th c., Kirkman, and later, Broadwood and Schudi, were the famous makers in London. After the invention of the pianoforte, the harpsichord and all instruments of the same kind, such as the spinet, were in time entirely superseded. See PIANOFORTE.

HARPSWELL, a t. in Cumberland co., Me., consisting of a peninsula and islands in Casco bay, 14 m. e. of Portland, pop. 1749. It is somewhat noted as a resort for pleasure-seekers.

HARPY, a fabulous creature in Greek mythology, considered as a minister of the vengeance of the gods. Various accounts are given of the the numbers, and parentage of the harpies. Homer mentions but one, Hesiod enumerates two—Aëllo and Okypete, daughters of Thaumas by the Oceanid Electra, fair-haired and winged maidens, very swift of flight. Three are sometimes recognized by later writers, who call them variously daughters of Poseidon or of Typhon, and describe them as hideous monsters with wings, of fierce and loathsome aspect, with their faces pale with hunger, living in an atmosphere of filth and stench, and contaminating everything that they approached.

The most celebrated tradition regarding the harpies is connected with the blind Phineus, whose meals they carried off as soon as they were spread for him; a plague from which he was delivered by the Argonauts, on his engaging to join in their quest. The Boreads Zetes and Calais attacked the harpies, but spared their lives on their promising to cease from molesting Phineus.—A harpy in heraldry is represented as a vulture, with the head and breast of a woman.

The name harpy has also been given in modern times to some of the *falconidæ*, as the marsh harrier (see HARRIER) of Europe, and the harpy or harpy eagle of South America (*harpyia destructor* or *thrasaëtus harpyia*), an inhabitant of the great tropical forests, where it preys chiefly on quadrupeds and to a large extent on sloths and young deer. Of all birds it has the most terrific beak and talons. It is larger than the common eagle; is short-winged and short-legged; the upper mandible greatly hooked; the feathers of the head capable of being erected into a great ruff and crest. It has not so elegant a form as the true eagles, but is probably equal to any of them in strength and courage. When adult, it is generally of a blackish slate color, with gray head, and white breast and belly. It makes its nest in trees.

HARQUEBUSS. See ARQUEBUSS.

HAR'RIER, a variety of dog used for hare-hunting, whence its name; probably of the same origin with the foxhound (q.v.)—from which it differs chiefly in its smaller size—or perhaps partly derived from the beagle. It does not exceed 18 in. in height at the shoulder, but otherwise greatly resembles the foxhound, even in colors. It is not so swift as the foxhound. Its scent, however, is extremely keen, which enables it to follow all the doublings of the hare.

Persons hunting with harriers are exempt from taking out a game license. See HARES.

HARRIER, *Circus*, a genus of *falconidæ*, allied to buzzards (q.v.), but differing from them in the more slender form of the body, longer and more slender legs, longer wings and tail, and in having the feathers around the eyes placed in a radiating manner, somewhat as in owls, a peculiarity which distinguishes them from all the other falconidæ. They are remarkable for their low flight, skimming along the ground in pursuit of small quadrupeds, reptiles, etc. The MARSH HARRIER (*C. æruginosus*), also called the MOOR BUZZARD, and sometimes the HARPY and the DUCK HAWK, is the largest British species, being about 21–23 in. long. The head of the adult male is yellowish white.—The HEN Harrier (*C. cyaneus*) is 18 or 20 in. long, the adult male of an almost uniform gray color, the female brown. The female is known as the RING-TAIL, from a rust-colored ring formed by the tips of the tail-feathers. The hen harrier derives its name from its frequent depredations in poultry-yards. The male of the hen harrier is called the *Blue Hawk* in Scotland.

HARRI-KARI (Happy Despatch), the term applied by the Chinese to official suicides in Japan. According to Dr. Macgowan, the Japanese estimate the number of these suicides at 500 per annum, exclusive of suicides by hanging or drowning. All military men, and persons holding civil offices under the government, are bound, when they have committed any offense, to rip themselves up, which they do by two gashes, in the form of a cross: but not until they have received an order from the court to that effect; for, if they were to anticipate this order, their heirs would run the risk of being deprived of their place and property. Not unfrequently, upon the death of superiors or masters, the same operation is self-inflicted by those who desire to exhibit devotion and attachment; sometimes also, in consequence of a disgrace or affront, it is resorted to, when no other resource presents.

HARRIMAN, WALTER, b. N. H., 1817; a teacher, Universalist minister, and political speaker. In the war of the rebellion he commanded a regiment of volunteers from New Hampshire. In 1867 he was chosen governor of that state, and afterwards was naval officer at Boston.

HARRINGTON, JAMES, an English political writer, was b. in Northamptonshire, of a good family, in 1611, studied at Oxford under the celebrated Chillingworth, and, at the termination of his university career, proceeded to visit the continent. His travels embraced the Netherlands, Germany, Denmark, France, and Italy. On the breaking out of the civil war, he took part with the parliament, and in 1646 was appointed by the parliamentary commissioners one of the personal attendants of the monarch. After the execution of Charles, he withdrew from public notice, and devoted himself to the elaboration and completion of his political system. The result was his famous *Oceana*, a kind of political romance, on the plan of Plato's *Atlantis*. The work was first published in 1656, and was dedicated to Cromwell, who read it, but was not overwell pleased with its strait-laced and somewhat finical republicanism, and its animadversions upon usurpation. "The gentleman must not think," the protector is reported to have said, "to cheat me of my power and authority; for what I have won by the sword, I will not suffer myself to be scribbled out of." Hume allows it to be "a work of genius and invention," and Dugald Stewart calls it "one of the boasts of English literature." Hallam's verdict is less favorable; he pronounces the author to be in general "prolix, dull, pedantic, yet seldom profound;" but he admits that he

"sometimes redeems himself by just observations." After the publication of *Oceana*, Harrington continued to exert himself in diffusing his republican opinions, founded a club called the "Rota," fell under suspicion after the restoration, and was imprisoned, but afterwards released. Meanwhile, however, an attack of insanity had supervened, from which he never perfectly recovered. He died at Westminster, Sept. 11, 1677. An edition of his writings was published by Toland in 1700, and a more complete one by Dr. Birch in 1737. The best edition is probably that by Hollis (with Toland's Life), in 1771.

HARRIOT, or HARIOT, THOMAS, 1560–1621; b. England; an astronomer and mathematician; tutor to sir Walter Raleigh, who, in 1585, appointed him geographer to the second expedition to Virginia. Harriot published an account of this expedition in 1588, and the work was afterwards reprinted in Hakluyt's *Voyages*. On his return to England, after an absence of two years, he resumed his mathematical studies with zeal and success; and having made the acquaintance of Henry Percy, earl of Northumberland, he received from him a yearly pension of £120. A manuscript of Harriot's entitled *Ephemeris Chrysometria* is preserved in Sion college; and his *Artis Analyticæ Praxis ad Æquationes Algebraicas resolvendas* was published at London in 1631. From some papers of Harriot's discovered in 1784, it would appear that he had either procured a telescope from Holland, or divined the construction of that instrument, and that he coincided in point of time with Galileo in discovering the spots on the sun's disk.

HARRIS, a co. in w. Georgia on the Alabama border and Chattahoochie river, crossed by the North and South Georgia railroad; 500 sq.m.; pop. '70, 13,284—7,493 colored. It has a hilly surface to a large extent covered with forests. Soil fertile; corn, potatoes, and pork are the chief products. Co. seat, Hamilton.

HARRIS, a co. in s.e. Texas, on Galveston bay, intersected by San Jacinto river and Buffalo bayou, and by four railroads; 1630 sq.m.; pop. '70, 17,375—6,509 colored. The surface is level and much of the soil is alluvial. Products: cotton, corn, and cattle. Co. seat, Houston.

HARRIS, CHAPIN A., 1806–60; b. N. Y.; organizer of the Baltimore dental college, which was the first institution of that character in the world. He published the *American Journal and Library of Dental Science, Dental Art, Principles and Practice of Dental Surgery*, and a *Dental Dictionary*.

HARRIS, or HERRIS, a district or parish of Scotland, in the Hebrides, comprises the southern portion of the island of Lewis and a number of adjacent islets. See LEWIS.

HARRIS, HOWELL, 1714–73; b. Wales; an open-air preacher and revivalist, the principal founder of Calvinistic Methodism in Wales. He was endowed with oratorical powers of the highest order, and his energy and enthusiasm carried his audiences by storm. He founded no fewer than 300 societies, was a friend of Wesley and Whitefield, and, when the French invasion of England was anticipated, raised a regiment at his own expense, and accompanied it on its march, preaching and expounding the Scriptures at every halting place.

HARRIS, JAMES, an English philologist and logician, the eldest son of James Harris, esq., of Close, Salisbury, was born July 20, 1709. His mother was the lady Elizabeth Ashley Cooper, sister of lord Shaftesbury, author of the *Characteristics*. He was educated at Salisbury, and Wadham college, Oxford, and entered upon the study of the law; but his father having died in 1734, leaving him a handsome fortune, he abandoned the pursuit of his profession, and gave his whole time, for a period of 14 years, to the study of his favorite Greek and Latin authors. In 1745 he married a daughter of John Clarke, esq., of Sandford, near Bridgewater, by whom he had five children, the eldest of whom, his only son, became the first earl of Malmesbury. In 1761 he was returned to parliament for Christchurch, which seat he retained until his death. In 1762 he was appointed a lord of the admiralty, and the next year, lord of the treasury, and in 1774, secretary and comptroller to the queen. He died in 1780. He is chiefly known as the author of *Hermes*, or a *Philosophical Inquiry concerning Language and Universal Grammar*, a work of great erudition, published in 1751. "It is written," says Coleridge, "with the precision of Aristotle and the elegance of Quintilian." He had previously published three treatises—*On Art; On Music, Painting, and Poetry;* and *On Happiness*. In 1775 appeared his essay *On Philosophical Arrangements*, part of a large projected work on the Logical System of Aristotle. His last work, entitled *Philological Inquiries* (1780), consists of a series of criticisms and comments on the principal ancient, mediæval, and modern authors. His works, with life by his son, the earl of Malmesbury, were published at London in 1801.

HARRIS, JOHN, 1802–56; an English theologian who at the age of 15 began to preach as a member of the Bristol itinerant society. After studying at the Independent college at Hoxton, he was in 1827 ordained pastor of a small congregation at Epsom. There in 1836 he wrote his essay *Mammon, or Covetousness, the Sin of the Christian Church*, which won a prize of 100 guineas offered by Dr. Conquest, and brought its author into notice, 30,000 copies being sold within a few years. In 1838 he received the degree of doctor of divinity from Brown university (R. I.), and was appointed president and professor of theology in Chestnut college; and in 1850, when the Independent colleges at

Highbury, Homerton, and Coward (near London) were united, Dr. Harris was elected principal of the new college thus formed.

HARRIS, SAMUEL, called the "apostle of Virginia," b. Va., 1724. He was a colonel of militia and held several public offices, but about 1758 was baptized and became an active preacher in the Baptist churches, his zeal and the force and plainness of his language bringing upon him persecution and physical abuse. In 1769 he was regularly ordained to the Baptist ministry. He was strongly opposed by the established church of Virginia, but abounded in charity, giving away a large part of his private means. In 1774 the general association of Separate Baptists elected him "apostle," and formally ordained him to that office.

HARRIS, SAMUEL, D.D., LL.D., b. Me. 1814; graduated at Bowdoin and in theology at Andover; teacher at Limerick and East Machias, Me. In 1841 pastor of a Congregational church in Conway, Mass., and in 1851 of the South Congregational church in Pittsfield. In 1855 he was chosen professor of systematic theology in the theological seminary at Bangor, Me., and in 1871 took the same position in Yale. Among his publications are *Zaccheus, or the Scripture Plan of Benevolence; Christ's Prayer for His Redeemed; The Kingdom of Christ on Earth;* etc.

HARRIS, THADDEUS WILLIAM, 1795-1856; b. Mass.; graduated at Harvard, and became a practicing physician. In 1831 he was chosen librarian of Harvard university. He devoted much attention to botany and natural history, and to promote the study of the latter science he organized a natural history society for the students of the college. In 1837 he was one of the state commission to make a botanical and zoological survey of Massachusetts, his most important works being a *Systematic Catalogue of the Insects of Massachusetts*, and his *Report on Insects Injurious to Vegetation.*

HARRIS, THOMAS LAKE, a spiritualist and social reformer, was b. at Fenny Stratford, Eng., May 15, 1823. In 1827 his parents brought him with them to the United States and settled at Utica, N. Y. He was yet very young when his mother died, and his father failed in business, thus throwing him upon his own efforts for education and support. He began to write for the press at an early age. At 21 he renounced the Calvinistic for the Universalist faith, and became a preacher of the latter. His health failing soon after his settlement over a church at Meriden, N. Y., he went to Charleston, S. C., whence he returned a year later to New York to become a pastor of the Fourth Universalist church, but ill health compelled him soon to resign. Sometime afterwards he organized in New York an "Independent Christian society," to which he ministered until the advent of "spiritualism" in 1849-50. He soon became a believer and supporter of the new faith. Two or three volumes of poetry from his pen were attributed to spiritual inspiration. He joined a community at Mountain Cove, Va., where it was proposed to apply the principles and laws of spiritualism to social relations and business affairs of the members, but in 1855 he returned to his ministry in New York, and founded a periodical for the exposition of his views. He became a dissenter from some of the doctrines of spiritualism as commonly understood. In 1857 he was, as he believed, subjected to sore temptations from evil spirits, whom he saw and with whom he conversed. He believed he won a victory over these spirits and attained the power, without losing external consciousness, of holding converse with the dwellers in the heavenly spheres. In 1858 he visited England and Scotland, and preached and lectured in London, Manchester, Edinburgh, and Glasgow. In 1861 he retired with a few friends to Amenia, Dutchess co., N. Y., and organized a community which grew into the "brotherhood of the new life," and in 1867 was removed to Portland, Chautauqua co., N. Y., where Mr. Harris purchased for himself a tract of 1000 acres of land, and adjoining farms of the same extent for his associates. Among those who joined him were lady Oliphant and her son Mr. Laurence Oliphant, M.P., from England. Owners of real estate cultivate it on their own account, community of property not being acknowledged. The "brotherhood" has no written creed or form of government. It is said to number more than 2000 people, mostly in Great Britain and on the continent, in India, and Japan, and to be held together by fraternal love and guided by an inspiration "from the Divine Spirit through the heavens," in fulfillment of a promise made "by the angel" to Swedenborg. They hold that man can be purified from sin and delivered from the power of evil spirits only through self-renunciation and a life of unselfish devotion to humanity, and that the church of the future will not be an ecclesiasticism, but a free society of people bound to each other by ties of fraternity and a common love of the Divine Being. They believe that God is two-in-one by the blending in him of the maternal with the paternal character, and that those who become angels will find their counterparts of sex and be joined together for all eternity. Marriage, therefore, is by them held to be peculiarly sacred and divine. Mr. Harris's prose works are: *Wisdom of Angels; Arcana of Christianity; Truth and Life in Jesus; Modern Spiritualism—its Truth and Errors; Sermons and Lectures; Millennial Age;* and *Breath of God with Man.* His poetical works are: *Starry Heavens; Lyric of the Morning Land; Lyric of the Golden Age; Regina; Hymns of Spiritual Devotion;* and *The Great Republic.*

HARRIS, TOWNSEND, 1803-78, an American diplomatist, b. at Sandy Hill, Washington co., N. Y. At the age of 14 he came to New York city and engaged in mercantile

life, but was actively identified with the cause of popular education. While president of the board of education, an office twice held by him, he succeeded in spite of long and pitiless opposition, in getting the free academy (now college of the city of New York) established. In 1848 he projected and carried out a voyage of exploration and commerce in the South Pacific, gaining vast information which he turned to the benefit of the country. He was U. S. consul at Ningpo, China, 1854. In 1855 he was considered by the patriotic men of all parties the best equipped man to follow up the work of com. M. C. Perry in Japan. On his voyage outward he negotiated a treaty with Siam, and from 1856 to 1861 was consul-general of the United States in Japan, residing at Shimoda; and in Yeddo where he negotiated a treaty of trade and residence for Americans in Japan. Perry opened Japan to ships and their crews only. Harris inaugurated the policy of friendship, commerce, and residence, which twenty nations now enjoy with Japan. He was one of the founders of the New York "society for the prevention of cruelty to animals." A biography of Harris is in preparation.

HARRIS, WILLIAM, S.T.D., 1765–1829; b. Mass.; graduated at Harvard and licensed as a congregational preacher, but became minister of an Episcopal church in Marblehead; subsequently rector of St. Mark's church, New York, and the founder of a school for classical studies. In 1811 he was elected president of Columbia college and held the office 18 years.

HARRIS, WILLIAM TORREY, LL.D., b. Conn. 1835; studied at Yale college; emigrated to the west and became a teacher in St. Louis, and soon afterwards superintendent of public schools. He was one of the founders of the St. Louis philosophical society, and in 1857 he started the *Journal of Speculative Philosophy*. In 1874 he was president of the national association of teachers. He is one of the recognized leaders in metaphysical investigation on this side the Atlantic. He is an earnest advocate and expounder of Hegel's philosophic system.

HARRISBURG, the capital of Pennsylvania, U. S., is situated in the midst of magnificent scenery on the left bank of the Susquehanna river, 107 m. w.n.w. of Philadelphia, lat. 40° 16′ n., long. 76° 50′ west. It has a handsome state-house, a court-house, jail, state arsenal, state lunatic asylum, numerous churches, several academies, eight or ten newspaper-offices, a railway bridge, 2,876 ft. in length, and seven diverging railways. It was settled in 1733 by John Harris, an Englishman, under a grant from the Penns, the original European settlers of Pennsylvania. Pop. '70, 23,104.

HARRISBURG (*ante*), the capital of Pennsylvania, in Dauphin co. on the Susquehanna river, and the Cumberland Valley, the Northern Central, the Pennsylvania, and the Philadelphia and Reading railroads; 106 m. by rail w. of Philadelphia; pop. '70, 23,104; in '80, 30,412. The Susquehanna is here over a mile wide, and there is a small island near the middle of the stream. There are three railroad bridges crossing the river. The city is handsomely situated in the midst of a picturesque and fruittul region. One of the most conspicuous edifices is the state-house, a fine brick structure 180 by 80 ft., with a circular Ionic portico over which is a dome, from which a splendid view is to be had. The capitol was first occupied in 1822. Among the other public buildings are the court-house, the state lunatic asylum, the prison, several market-houses, and some fine churches and school-houses. Harris park is a handsome public square. Among the chief manufacturing establishments iron foundries hold a leading place; there are also machine-shops, nail factories, car, coach, and steam-engine factories; cotton, knitting, planing, and saw mills, tanneries, breweries, etc. There is a regular city government consisting of a mayor and common council. The city is finely paved, and is supplied with gas and water. There are about 35 churches embracing more than a dozen denominations. The city is the seat of a Roman Catholic archbishop. The earliest settlement was in 1726 by John Harris, an Englishman, who engaged in trade with the Indians. In 1785 a town was laid out for the seat of justice of the county of Dauphin (named after the French dauphin). The town was named Louisburg, after Louis XVI., but six years later it was incorporated under its present name; in 1812 it was selected as the state capital, and in 1860 incorporated as a city.

HARRISON, a co. in s. Indiana on the Ohio river, intersected by Indiana creek, and the Missouri, Iowa and Nebraska railroad; 500 sq.m.; pop. '70, 19,913. It has a hilly and picturesque surface. Chief productions: corn, wheat, oats, and pork. Co. seat, Corydon.

HARRISON, a co. in w. Iowa on the Nebraska border, intersected by the Chicago and Northwestern, and the Sioux City and Pacific railroads; bounded on the w. by the Missouri; 700 sq.m.; pop. '80, 16,649. The surface is mostly level, and the soil fertile, producing corn, wheat, oats, etc. Co. seat, Logan.

HARRISON, a co. in n.e. Kentucky, intersected by Licking river, and the Kentucky Central railroad; 370 sq.m.; pop. '70, 12,993—2,378 colored. It has a hilly and undulating surface, and fertile soil. The main productions are corn, wheat, oats, and pork. Co. seat, Cynthiana.

HARRISON, a co. in s. Mississippi on the gulf of Mexico, drained by Wolf and Biloxi rivers, and reached by the Mobile, New Orleans and Texas railroad; 900 sq.m.;

pop. '70, 5,795—1427 colored. It has a prairie surface, with considerable timber. Co. seat, Mississippi City.

HARRISON, a co. in n. Missouri on the Iowa border, intersected by Crooked Fork of Grand river; 760 sq.m.; pop. '70, 20,318—73 colored. Surface prairie and timberland; main productions: corn, oats, wheat, pork, and cattle. Co. seat, Bethany.

HARRISON, a co. in e. Ohio drained by affluents of Tuscarawas river, and intersected by the Pittsburg, Cincinnati and St. Louis railroad; 400 sq.m.; pop. '70, 18,682. The surface is somewhat hilly, and the soil very fertile. Chief productions: corn, oats, wheat, butter, and wool. There are mines of bituminous coal. Co. seat, Cadiz.

HARRISON, a co. in s.e. Texas on the Louisiana border between Caddo lake and Sabine river, intersected by the Texas and Pacific railroad; 970 sq.m.; pop. '70, 13,241—8,931 colored. Surface uneven and much of it covered with forests. The soil is fertile, producing cotton, corn, etc. Co. seat, Marshall.

HARRISON, a co. in n. West Virginia on the w. fork of Monongahela river, traversed by the Baltimore and Ohio railroad; 445 sq.m.; pop. '70, 16,714—655 colored. The surface is hilly or mountainous with fertile valleys. Productions: corn, wheat, lumber, and pork. Co. seat, Clarksburg.

HARRISON, BENJAMIN, 1740–91; b. Va. He studied at William and Mary college, and in 1764, and 1777–82 was speaker of the colonial house of burgesses. He was an opponent of the stamp act, a delegate to the first continental congress, and one of the signers of the declaration of independence. In 1782 he was chosen governor of his state, and was twice re-elected. He was a member of the committee that adopted the federal constitution, but himself voted against it. He was the father of William Henry Harrison, ninth president of the United States.

HARRISON, JOHN, a celebrated mechanician, was b. at Faulby, near Pontefract, Yorkshire, in 1693. His mechanical genius, which early displayed itself, led him to study the construction of clocks and watches, with a view to diminishing as much as possible their errors and irregularities, and by 1726 he had effected considerable improvements in their structure. In 1714 the government had offered prizes of £10,000, £15,000, and £20,000 for the discovery of a method for determining the longitude within 60, 40, or 30 m. respectively. After repeated attempts, Harrison constructed a chronometer, which, in a voyage to Jamaica in 1761–62, was found to determine the longitude within 18 m.; he therefore claimed the reward of £20,000, which, after a delay caused by another voyage to Jamaica, and further trials, was awarded to him in 1765—£10,000 to be paid on Harrison's explaining the principle of construction of his chronometer, and £10,000 whenever it was ascertained that the instrument could be made by others. The success of Harrison's chronometer is owing to his application of the *compensation curb* to the balance wheel, and on the same principle he invented the *gridiron pendulum* for clocks. These, along with his other inventions, the *going fusee* and the *remontoir escapement*, were considered to be the most remarkable improvements in the manufacture of watches of the last century (see HOROLOGY). Harrison died in Red Lion square, London, in 1776.

HARRISON, JOHN, d. 1660; a col. in Cromwell's army, on whom devolved the duty of escorting Charles I. from Hurst castle to Windsor, in Dec., 1648, and from Windsor to London for trial. He was afterwards made a maj.gen., and became important in the councils of the protectorate. In religion he was a fanatic, and in 1653 was leader of the Anabaptists. On the restoration of Charles II. in 1660, Harrison was executed, in company with nine other regicides.

HARRISON, WILLIAM HENRY, ninth president of the United States, b. Feb. 9, 1773, in Virginia, was the son of Benjamin Harrison, who signed the declaration of independence. On the death of his father, he joined in 1792, as ensign, the army which Wayne was leading against the north-western Indians. He left the army in 1797. In 1801 he became governor of Indiana, and as its representative in congress, succeeded in passing a law relating to the sale of the federal land in small parcels, to which the western states ascribe all their prosperity. In the war against the Indians in 1811, and which soon became also a war against the English in Canada, Harrison, as commander-in-chief of the American army, showed great military talent. He defeated the Indians in an important battle at Tippecanoe, and by the victory of Perry on lake Erie, was enabled to pursue the British invaders into Canada, where, on Oct. 5, 1813, he totally routed them in the battle of Thames. In 1814 he resigned his commission. In 1816 he was elected to congress, and in 1824 became a member of senate. In 1828 he went as ambassador to Colombia, but was recalled in 1829, and for 12 years was clerk of a county court in Ohio. The whig party tried in vain to make him president of the United States in 1836, but succeeded in 1840. He died a month after his inauguration, in April, 1841.

HARRISONBURG, the seat of justice in Rockingham co., Va., on a branch of the Baltimore and Ohio railroad, in the Shenandoah valley, 2 m. n.e. of Staunton; pop. 3,600. In the place are eight churches, several schools, and a number of manufactories.

HARRODSBURG, the seat of justice of Mercer co., Ky., on a branch of the Cincinnati Southern railroad, and near Salt river, 32 m. s. of Frankfort; pop. '70, 2,205. It has mineral springs, and is a place of summer resort. Among its institutions is Daughters' college, under the care of the Christian denomination. There are flour mills, carriage factories, and distilleries. It is said to be the oldest town in the state, the settlement dating from 1774, when capt. James Harrod put up the first cabin in that neighborhood.

HARROGATE, HARROWGATE, or HIGH HARROGATE, a village in Yorkshire, 20 m. w. of York city, is celebrated for sulphureous and chalybeate springs. The sulphureous springs are also saline, and of laxative and diuretic quality, while the chalybeate waters are tonic. Harrogate is a very agreeable residence, the surrounding country being full of beauty and interest; it is largely frequented by visitors in summer, and is now easily accessible by the railway from Leeds to Doncaster. The waters are of considerable activity, and should only be taken under medical advice. They are used both externally and internally, and are in great repute in many diseases of the skin, and in some cases of dyspeptic disorders, scrofula, gout, etc. Harrogate springs were discovered in 1571. A local report on their virtues, with analyses in detail, by prof. Hoffman, was published in 1854. Pop. in '71, 6,843.

HARROW, an agricultural implement, used for smoothing and pulverizing plowed land, for covering the seeds previously sown. It consists of a frame of a square or rhombic form, in which are fixed rows of teeth, or *tines*, projecting downwards. The harrow is a very ancient implement, having been in use beyond the dawn of history; but as in early times only the lighter soils were cultivated, it often consisted of bushes, or branches of trees, which merely scratched the ground. Subsequently, we find a wooden frame and wooden tines in use; next, the wooden frame with iron tines, a form of the instrument very much used at the present day, and especially in favor for light soils. For heavy soils, the harrow constructed wholly of iron is most used, as it is heavier and does more execution; and of this sort the zigzag form made by Mr. Howard of Bedford is preferred. The Howard harrow has the tines so arranged that no one follows in the track of another, but each has a separate line of action, which greatly diminishes the risk of any portion of the surface escaping pulverization. A "brake" is a large harrow used for breaking down rough or hard land. The "chain-harrow," which is a congeries of iron rings, is useful for covering grass-seeds, and especially for separating weeds from the earth or clods in which they are enveloped.

HARROW-ON-THE-HILL, a village of Middlesex, England, is finely situated on the summit of a small eminence about 12 m. n.w. of London, on the London and Birmingham railway. Pop. '71, 4,997. The village derives its celebrity solely from the grammar-school founded here, in 1571, by John Lyon, a wealthy yeoman of the parish. The school was originally intended to afford a gratuitous education to poor boys belonging to the parish, and is still nominally free to all the boys of the parish, but, as in many other cases, it has been diverted from its primary purpose, and is now chiefly attended by the sons of the nobility and gentry, and possesses a very high reputation. It has several exhibitions to Oxford and Cambridge. Among the eminent men who have been educated at Harrow-on-the-hill, may be mentioned sir William Jones, Dr. Parr, lord Byron, George Canning, and sir Robert Peel.

HARRY, BLIND, a Scottish minstrel of the 15th century. Scarcely anything is known of his life beyond what is told by Dr. John Major (or Mair) in his *History of Scotland*, published in 1521. "When I was a child," he says, "Henry, a man blind from his birth, who lived by telling tales before princes and peers, wrote a whole book of William Wallace, weaving the common stories (which I, for one, only partly believe) into vernacular poetry, in which he was skilled." In 1490–92, Blind Harry is found at the court of king James IV., receiving occasional gratuities of five, nine, and eighteen shillings. The poem attributed to him, *The Life of that Noble Champion of Scotland, Sir William Wallace, Knight*, was completed before the end of the year 1488, when it was copied by John Ramsay. This copy, the oldest MS. of the work now known to exist, does not ascribe it to Blind Harry, nor is his name given to it in the earlier printed editions. The poem, which contains 11,861 lines, of ten syllables each, is written in rhyming couplets. The language is frequently obscure, and sometimes unintelligible, but the work as a whole is written with vigor; in some passages, it kindles into poetry; and it is altogether a surprising performance, if we receive it as the composition of one who was born blind. The author seems to have been familiar with the metrical romances which were the popular literature of the time, and he makes repeated appeals to two Latin lives of Wallace, one by his schoolfellow, master John Blair, another by sir Thomas Gray, parson of Liberton. But the poem has no claim to be regarded as history; it is full of gross mistakes or misrepresentations of facts known to every one, and it can only be looked upon as an embodiment of the wild and sanguinary legends which two centuries had gathered round the name of the martyred hero of a fierce struggle for national life. The work is believed to have been printed in the Scottish capital as early as 1520, but no perfect copy is known to be preserved of any earlier edition than that of Edinburgh in 1570, bearing the title of *The Actis and Deidis of the Maist Illuster and Vailyeand Campioun Schir William Wallace, Knicht of Ellerslie.*

The work was reprinted at Edinburgh in 1594, 1601, 1620, 1648, 1673, and 1758; at Glasgow, in 1665 and 1699; at Aberdeen, in 1630; and at Perth in 1790. The best edition is that of Dr. Jamieson (from the MS. of 1488), published at Edinburgh in 1820, in 1 vol. 4to. The work was for about 200 years one of the most popular in Scotland, but gradually fell into neglect as its language, never very easy ceased to be understood except by scholars. Its place was supplied by a modernized version by William Hamilton of Gilbertfield, published at Glasgow in 1722, with the title of *A New Edition of the Life and Heroic Actions of the Renoun'd Sir William Wallace.* This is a poor performance, but it continued to be widely circulated among the Scottish people almost to our own day.

HART, the name given to the stag (q.v.) or male of the red deer, from the age of six years, when the crown or *surroyal* of the antler begins to appear. Great importance was formerly attached to the distinction of names proper to deer at different ages, and Guillim, in his heraldry, defines hart as above, rebutting the notion "that a stagge, of what age soever he be, shall not be called a hart until the king or queen have hunted him;" but "if the king or queen do chase or hunt him, and he escape away alive, then after such hunting or chasing he is called a *hart royall.*"

HART, a co. in n.e. Georgia on the border of South Carolina, bounded n. and e. by Savannah river; 380 sq.m.; pop. '80, 9,094—2,804 colored. The surface is uneven, and much of it is covered with forests. Corn and cotton are the chief productions. Co. seat, Hartwell.

HART, a co. in w. central Kentucky on Green river, intersected by the Louisville and Great Southern railroad; 420 sq.m.; pop. '70, 13,687—2,192 colored. The surface is hilly, and to a large extent covered with forests. The main products are cotton and corn. Co. seat, Hartwell.

HART, JAMES MCDOUGAL, b. Scotland 1828; came, when a child, to the United States, and became a coach-painter in Troy, N. Y. A love of art led him to attempt landscapes, and in 1851 he studied in Düsseldorf under Schermer. In 1856 he settled in New York, and the next year became an associate in the academy of design, and two years later an academician. "Autumn Woods in the Adirondacks," "Coming out of the Shade," and "On the March" are some of his more noted works. Mr. Hart, with his brother William, was among the first of that group of American artists who have made American landscape art eminent. He paints with vigor, and close adherence to nature; his work is full of sentiment, and is further marked by great breadth of handling in composition.

HART, JOEL T., b. Ky., 1810. When about 20 years of age he began to work for a stone-cutter, and at once exhibited a talent for modeling in clay, which attracted public attention, and he was employed to model busts of gen. Jackson and Cassius M. Clay. Of the latter he made a bust in marble, and this was so satisfactory that an association of ladies engaged him to produce the statue of Henry Clay, which is in Capitol square, Richmond, Va. There is a specimen of his work in bronze in New Orleans, in the shape of a colossal statue of the same statesman. Hart has resided many years in Florence, where he has made numerous statues, busts, etc. Among them "Angelina," "Il Penserosa," and "Woman Triumphant."

HART, JOHN, 1708–80; b. N. J.; a farmer, and several times a representative in the provincial legislature, and in 1776 was sent to the continental congress. He was, in 1777–78, a leading member of the committee of safety. During the English invasion his farm was desolated and he was hunted as a fugitive. After the battle of Trenton he returned to his home. He was one of the signers of the declaration of independence.

HART, JOHN SEELEY, LL.D., b. Mass., 1810; graduated at Princeton, taught at Natchez, Miss.; and in 1834 returned to the college of New Jersey as adjunct professor of ancient languages, where (1836–41) he was in charge of the Edgehill school. He was principal of the Philadelphia high school (1842–59), and of the New Jersey state normal school (1863–71); in 1872 became professor of rhetoric and the English language in the college of New Jersey. Among his publications are *Prose Writers of America; Manual of English Literature; Manual of American Literature,* etc.

HART, NANCY, a colored woman of Georgia, famous in the revolution for acts of valor in support of the cause of American freedom. Her chief exploit was in the case of five tories who came to her cabin intent on plunder and outrage. She killed one, seriously wounded another, and took the other three prisoners. Hart county bears her name, given in honor of her patriotic conduct.

HART, SOLOMON ALEXANDER, R.A., an English painter, of Jewish origin, was b. at Plymouth, in Devonshire, April, 1806, entered the Royal academy, London, in 1823, and exhibited his first oil-picture, "Instruction," in 1828. Since then, he has painted, among other works, "The Elevation of the Law" (1830); "Isaac of York in the Donjon of Front-de-Bœuf" (1830); "English Nobility privately receiving the Catholic Communion" (1831); "Eleanor sucking the Poison from Edward's Arm"; "Milton visiting Galileo in Prison" (1847); and "The Three Inventors of Printing" (1852). In 1835 Hart became an associate; in 1840 an R.A; in 1854 professor of painting in, and in 1865 libra-

rian of, the Royal academy. His picturesque vigor and technical power are universally acknowledged.

HART, WILLIAM, brother of JAMES MCDOUGAL HART; b. Scotland, 1823; came to Albany, N. Y., in 1831, and, like his brother, was employed in coach painting in Troy. Like his brother, also, he developed a taste for landscape painting, and in 1848 exhibited a specimen of his work in the National academy of design in New York. In 1850 he returned to his native country for study. On returning he settled in New York, and soon became an academician. For several years he was president of the Brooklyn academy of design. Some of his most notable works are "The Last Gleam," "The Golden Hour," "Opening in the Elands," "Up the Glen in the White Mountains," and "Sunset in Dark Harbor, New Brunswick." He was one of the founders, and for some years president of the water-color society, and is himself eminent in that branch of art. He is remarkable for luminous brilliancy of coloring, particularly in skies.

HARTE, FRANCIS BRET, b. N. Y., 1839; went to California when 25 years old and roved about, digging for gold, teaching school, and running express. In 1857 he appeared in the *Golden Era* as a type-setter, but soon began to write sketches for the paper which attracted immediate attention. He was advanced to assistant editor, and a little later became principal editor of the weekly *Californian*. He was for six years secretary of the mint in San Francisco, and during the time wrote a number of poems for the city journals, such as "The Society upon the Stanislaus," "The Pliocene Skull," and "John Burns of Gettysburg." In 1868 he was an editor of the *Overland Monthly*, in which he began more ambitious work with "The Luck of Roaring Camp," a characteristic picture of mining life. The next year he published "The Outcasts of Poker Flat," following with other tales of a similar kind. In 1870 appeared a short poem entitled "Plain Language from Truthful James," or "The Heathen Chinee," which had unexampled popularity. For a short time he was professor of recent literature in the university of California. In 1871 he removed to New York and collected and published his *Condensed Novels*. Among other of his publications are *Gabriel Conroy*, *East and West Poems*, *Mrs. Skagger's Husbands*, etc. He has been a frequent contributor to the *Atlantic Monthly*. In 1878 he was appointed U. S. consul to Crefeld, in Rhenish Prussia, and afterwards exchanged to Glasgow, Scotland.

HARTEBEEST. See KAAMA.

HARTFORD, a co. in n. Connecticut, on the Massachusetts border, intersected by Connecticut, Farmington, Scantic, and Hockanum rivers, and by six railroads; 770 sq.m.; pop. '70, 109,007; in '80, 125,377. It has a hilly surface, and the soil is generally very fertile; chief productions: tobacco, corn, oats, butter, and fruit. There are also a large number of important manufacturing establishments. Co. seat, Hartford city.

HART FORD, an important city of Connecticut, U. S., and capital of the state, is situated on the w. bank, and 50 m. from the mouth, of the Connecticut river, and distant 111 m. n.e. from New York. It has a handsome state-house, city hall, arsenal, deaf and dumb asylum, an admirable asylum for the insane, an Episcopal college, numerous churches, a free library, 12 newspapers, and many banks and insurance offices. It has a large trade and many flourishing manufactories, among which is the large establishment for the making of Colt's firearms. The various manufactures amount to over £1,000,000 per annum. Railways connect the city with all New England, and many lines of steamboats, packets, and sailing-vessels carry on extensive commerce. Tobacco and silk are among its exports, and its manufactures of cotton, books, carriages, clocks, machinery, etc., are distributed over the whole continent. Hartford is one of the oldest towns in New England, where were enacted the famous "blue laws." Pop. in '70, 37,180. It was also the seat of the Hartford convention (q.v.).

HARTFORD (*ante*) is on the New York, New Haven and Hartford railroad; pop. '80, 42,553. This "queen city of New England" is beautifully situated on small hills at the junction of the Park river with the Connecticut. The township extends about 5½ m. n. and s., and 3¾ e. and w., having an area of more than 16 sq.m.; the city area is about 10 sq. miles. Park river runs through about the middle, and is crossed by a dozen bridges. There is a fine bridge over the Connecticut, about 330 yards long, connecting with East Hartford. The city is regularly laid out, Main street being the great thoroughfare and chief seat of retail trade. In the outer portion and the suburbs of the city are many fine residences. The principal pleasure-ground is the Bushnell park, named after the late rev. Dr. Horace Bushnell, whose memory Hartford treasures as one of its peculiar honors. The park is one of the finest of its size in the country. It covers 45 acres, and is nearly encircled by Park river. In the w. part are the state capitol, a colossal bronze statue of Thomas Church Brownell, Episcopal bishop of Connecticut and the founder of Trinity college (Hartford); Ward's statue of gen. Israel Putnam, and a statue of Dr. Horace Wells, in honor of his discovery of the use of anæsthetics. In the heart of the city is Statehouse square, containing the original statehouse, a brick structure built in 1794. The famous Hartford convention met in the senate chambers in 1815. In the secretary's office is the original charter of the colony framed in wood, of the charter oak. There are in the senate chamber Stuart's portrait of Washington, and portraits of all the governors of the colony and state from 1667

down. The new state capitol occupies the former site of Trinity college. The building, completed in 1878 at a cost of $1,500,000, is of white marble, 300 by 200 ft., and 250 ft. to the top of the dome. Its fronts are broken by angles, columns, arches, galleries, and commemorative sculpture. Resting on the brow of a hill, it commands a splendid view, and is itself seen from all parts of the city. The hall of representatives is in the center of the s. front, and is lighted on three sides. The arcades are upheld by polished granite columns, and the tympani are filled with sculptures, the subjects of which were selected from Connecticut history. At the angles of the dome are statues representing 12 of the original states, and on the top is a statue of Connecticut holding her charter. The new site of Trinity college is on Rocky hill, approached by avenues leading through the most delightful part of the city. The buildings (yet unfinished) are of brownstone in early French Gothic style. They will form three great quadrangles, and are intended to be the best edifices for educational purposes in the country. The front will be 1300 ft. long. The grounds cover 80 acres. The high school is a noble building, of Norman architecture, costing $160,000. Near by, on Asylum street, is the residence of the late Lydia H. Sigourney, the poetess. A mile away on a hill lives Samuel L. Clemens, more generally known as "Mark Twain." Another conspicuous feature is Armsmear, the residence of the Colt family, the spacious grounds being adorned with groves, lakes, statuary, greenhouses, and a deer park. The deaf and dumb institute, founded by Dr. Gallaudet in 1817, is the oldest of its kind in America. The building is finely situated on a shady hill, and usually has from 200 to 250 inmates. The retreat for the insane is a stately sandstone building commanding a splendid view. More than 4,000 patients have been received here, and 2,000 have been cured. The city hospital, the state arsenal, and the widows' home are also noteworthy edifices. Besides these there are many conspicuous business edifices of great extent and value. The great manufactories are the Colt rifle and pistol factory (capital $1,000,000), the Washburn car-wheel factory, the Weed sewing machine factory, the Pratt and Whitney machine company, the Phœnix iron foundry, the Plimpton envelope company, the Batterson marble works, and the Cheney silk works. Among the great book makers are the American publishing company, and Case, Lockwood and Brainard. There are 37 churches, many of them very beautiful structures, particularly that of the Good Shepherd (Episcopal) built by Mrs. Colt as a memorial to her husband, of Gothic style with grand pictorial windows. In the old graveyard behind the Center Congregational church lie the remains of Thomas Hooker, "the renowned minister of Hartford, and pillar of Connecticut, the light of the western churches," with the ashes of a long line of distinguished citizens from the earliest settlement. The chief monument is a massive sandstone structure to the honor of the first settlers. There are 17 banks, 9 masonic lodges, 3 of odd-fellows, 3 knights of Pythias, 21 temperance societies, and 7 military companies. Of the latter, the Putnam phalanx of only 125 men are said to represent $11,000,000 of property. In proportion to the number of inhabitants, Hartford is supposed to be the richest city in America. The Cedar hill cemetery, on a bare and lofty elevation, has some fine monuments, including the Beach memorial, and testimonials to Colt, Russell, and others. Another institution worthy of note is the Wadsworth athenæum in which are many works of art by painters and sculptors. The Connecticut historical society has quarters in the athenæum, and has a remarkable collection of ancient documents illustrating New England history.

The city is divided into seven wards; the mayor is chosen for two years; the aldermen (two for each ward) are chosen one-half annually, and hold office two years; and the council of four for each ward are elected annually. There are police and fire departments, good water supply, and gas. Among the institutions not mentioned are the Hartford hospital, the orphan asylum, city mission, home mission, state Bible society, state missionary society, a number of private benevolent societies, a female seminary, and several select schools. There are 16 public schools, a grammar school (the oldest in the state), dating from 1655, and a school of design. Hartford has an interesting history. It was settled in 1635 by persons from Massachusetts, but originally from Braintree, England. The Dutch of New Amsterdam had possession for a time, but were ejected in 1654. The general court of the colony was established in 1636; the first church built in 1638; a war with the Pequot Indians occurred in 1637, and in 1639 a constitution for the government of the colony was framed. A house of correction was built in 1640, and four years later the first tavern was authorized. In 1650 a code of laws was drawn up which reduced the number of capital offenses from 160 under English law to 15. In 1687 gov. Andros attempted to seize the colonial charter, but it was carried off and hid in the famous charter oak. A printing establishment was started in 1764. Connecticut was early in the patriotic movement of the revolution, and Hartford was well represented at the taking of Ticonderoga. In 1784 the city was incorporated, and in 1875 it became the sole seat of the state government, an honor theretofore shared with New Haven.

HARTFORD CONVENTION, in the political history of the United States, was an assemblage of delegates from the New England states, at Hartford, Conn., Dec. 15, 1814. This convention was proposed by the Massachusetts legislature, which appointed delegates from that state. The government of the United States, under the

presidency of Mr. Madison, declared war against Great Britain in 1812, for injuries to commerce growing out of the war with France, and the impressment of American seamen by British men-of-war. Of the two American political parties, the democratic favored France, while the federalists took the part of England. As the war destroyed commerce and the fisheries, the chief interests of New England, which was also federalist in politics, there was a violent opposition. The governors of these states would not allow the militia to leave them, and complained that while their people were taken by conscriptions, their own coasts were left undefended. The ostensible object of the convention was to devise means of security and defense. George Cabot of Massachusetts was elected president, and Theodore Dwight of Connecticut, secretary. It sat 20 days with closed doors, and as it was supposed to be of a treasonable character, it was watched by a military officer of the government. The convention, at rising, proposed certain amendments to the constitution—free population as the basis of representation, a single term for the presidency, to exclude foreigners from office, to limit embargoes to 60 days, and to require a two-thirds vote of congress to admit new states, make war, etc. Though no treasonable act was committed, and no treasonable intention proved, the federalist party never recovered from the odium of its opposition to the government, and "Hartford Convention Federalist" has been to this day a term of reproach.

HARTFORD CONVENTION (*ante*). To the brief statement under this head may be added from the journal of the assembly (not published until 1833) some further facts, premising, however, that much of the odium thrown upon the convention was undeserved, and mainly the offspring of partisan malignity. The controlling idea of the body was the preservation of those state rights for which their opponents, the democrats, were then and have ever since been loudly clamoring. The men composing the convention were among the best and most intelligent citizens, but all were federalists. The war with England had destroyed the prosperity of the eastern states, yet they made no opposition to the war, as was untruly charged. In fact the war was over, for the peace of Ghent was agreed upon before the convention got fairly to work, though the fact was unknown, and the battle of New Orleans was fought nearly two weeks after the treaty was signed. The federalists, at whose head once stood George Washington, had greatly declined, and had no real strength in the nation. The complaints of the convention were: That the New England states were deprived of their militia while their sea-coast was left at the mercy of the English enemy; that some check ought to be put upon the almost arbitrary powers of the general goverment; but the acts of the three states calling the convention were to be "not repugnant to their obligations as members of the union." So said Massachusetts, and Connecticut and Rhode Island agreed. There is no ground for the charge that the convention was or intended to be disloyal. The main propositions are stated (see Hartford Convention, *ante*), and amount to this: That the people of a state ought not to be subject to draft or conscription "not authorized by the federal constitution." That the general government ought to empower the states to defend their own territory against foreign enemy. That the legislatures of the three states should authorize their governors to make detachments of militia or farm corps which should be ready for service in the state, or, on the application of a governor, to assist in defense in other states. The convention's views on amending the federal constitution savored of that nativism that afterwards developed into a great but short-lived American party. They held that no person not then naturalized should afterwards be eligible for a member of congress, or hold any civil office under the authority of the United States. Their one term for president had long been popular with nearly half of the voters in the union, though they went a step further and wished to provide that a state should not furnish two presidents in succession. They would require a vote of two-thirds of each house of congress for the admission of a new state, and would have representatives and direct taxes apportioned (as they now are) on the basis of the number of free persons in a state. This was of course aimed at the southern states, where the slaves were counted in a two-thirds ratio as representative people. The convention, with a view to the great commercial interest of the eastern states, desired that a vote of two-thirds in congress should be necessary to declare war or interdict commerce, except in case of an actual invasion. The convention met Dec. 15, 1814, and adjourned Jan. 5, 1815. There were 12 delegates from Massachusetts, 7 from Connecticut, 3 from Rhode Island, 2 from part of New Hampshire, and 1 from a county in Vermont—in all 25 persons.

HARTLEPOOL, a municipal and parliamentary borough, seaport, and market town of England, in the co., of Durham, is situated on a small peninsula, n. of the estuary of the Tees, 20 m. e. s. e. of Durham. It consists of one principal and several smaller streets, and was formerly surrounded by walls. The harbor is safe, and easily accessible; extensive docks have been constructed. Fishing is here carried on with success. Hartlepool formerly attracted many visitors for sea-bathing during the summer months; but since its recent commercial revival, owing to the formation of railways connecting it with the coal-mines of Durham, it is no longer visited for that purpose. In 1875 (including w. Hartlepool), 2,208 vessels, of 525,637 tons, entered, and 5,170, of 964,528 tons, cleared the port. In 1875, 5 iron steam-ships, of 3,995 tons, were built here. The

trade is chiefly in coal. As one of the Hartlepools, it joins in sending one member to parliament. Pop. of municipal borough ('71), 13,166.

HARTLEPOOL, WEST, a modern market town and seaport in the co. of Durham, situated 1 m. to the westward of the ancient borough of Hartlepool, and within the township of Stranton. It has sprung into existence within recent years, having been founded by Ralph Ward Jackson, esq., an enterprising railway speculator, in 1847. It consists of one principal and several diverging streets, and possesses a large and handsome Gothic church, several large hotels and dissenting chapels, a theater, athenæum, and mechanics' institute, custom-house, market-house, and other public buildings, and had in '71 a pop. of 21,110. The first harbor was constructed here in 1847, of 13 acres, and has since been enlarged to 44 acres. The first dock has a water area of 8 acres; the Jackson dock has 14 acres; and the Swainson dock, 10 acres. There are also large graving docks, timber-ponds, and about 3 m. of quays. The export of coal from the united port is about 1,500,000 tons annually. In 1866, a poor year, 575,899 tons were exported coastwise, and 903,611 to foreign ports. Besides coal, the following are the principal imports: Flax and hemp, grain, timber, butter, cheese, fruit, cattle, tallow, yeast, iron, zinc, etc.; the exports consisting of woolen, cotton goods, copper, cement, drugs, machinery, earthenware, yarn, hides, etc.; the trade being carried on for the most part with the Baltic ports, Cronstadt, St. Petersburg, and Dantzic, and with Hamburg and Rotterdam. Iron ship-building is carried on here to a large extent: in 1875, 7 steam-vessels, of 5,132 tons, and 3 sailing-vessels, of 1,886 tons, were turned out, making a total of 10 iron vessels of 7,018 tonnage. There are large iron-foundries, cement-works, locomotive engine and boiler works, mast and block lofts, saw-mills, tile-works, and brick-fields. The Hartlepool boroughs consist of Hartlepool, West Hartlepool, Throston, Stranton, and Seaton Carew, and send one representative to the house of commons.

HARTLEY, Sir CHARLES AUGUSTUS, b. England 1825; an engineer and railroad builder. He served through the Crimean war, as capt. of engineers in the Turkish contingent, in 1857 was made engineer-in-chief to the European commission of the Danube, and in 1862 was knighted by the queen. He has been concerned in a great number of enterprises in the line of his profession in the employ of the English, Russian, Turkish, and other governments.

HARTLEY, DAVID, a celebrated mental philosopher of last century, was b. Aug. 30, 1705. His father was vicar of Armley, in Yorkshire. At 15 he entered Jesus's college, Cambridge, and became a fellow of the college. He studied at first for the church, but his turn for original and independent thinking led him to dissent from some points in the 39 articles, and he, in consequence, had to adandon his original intention. What his precise difficulties were, we are not informed; we know only that, in his mature years, he impugned the eternity of hell-punishment, maintaining the ultimate restoration of the damned. In all other points his published opinions coincided with the church of England, and he continued to the last a member of the church. He finally chose the profession of medicine, in which he attained considerable eminence. He practiced as a physician successively at Newark, Bury St. Edmunds, in London, and at Bath, where he died on Aug. 25, 1757, at the age of 53 years.

His work on the mind, entitled *Observations on Man*, on which his fame rests, was begun when he was about 25, and occupied his thoughts for 16 years. It was published in 1749. The first part relates to the constitution of the human mind, and is the really important and original part. The second part treats of religion and morals, and might have been written by any orthodox clergyman, if we except the opinion above stated with reference to future punishment.

His handling of the mind turns throughout upon two theories or hypotheses, which have very different merits, and are by no means necessarily conjoined, although they are never separated in his mind. The first is called the doctrine of vibrations, or a theory of nervous action analogous to the propagation of sound, the suggestion of which he owed to Newton, of whose writings he was a devoted student. His second and most valuable innovation consisted in showing that the faculties, powers, and feelings of the mind might be explained to a very wide extent by the principle of the association of ideas (see ASSOCIATION OF IDEAS), a principle far from new in the statement of it, but never before appreciated in anything like the range of its bearings upon the phenomena of mind.

The doctrine of vibrations supposed that when any one of the senses is affected by an outward object, the effect was to set the particles of the nerve in a vibratory motion, which ran along to the brain, and produced corresponding vibrations in the cerebral substance. In like manner, when an active impulse proceeded outwards to the muscles, the manner of communication along the nerves was of the same kind. He even extended these molecular vibrations to the other tissues. As a hypothesis, this assumption was so far legitimate, if it served to explain the facts, or even to imagine in a probable way what goes on in the substance of the nerves and brain during the processes of sensation, thought, and volition. The distaste that has generally been entertained towards this part of Hartley's speculations, arose from a mistaken notion of its favoring materialism. Not only was the author not a materialist—being most express in affirming a spiritual entity different from the body—but his views had

nothing more of materialism in them than the views that mankind have always held as to the connection of mind with bodily actions.

As regards the second doctrine of Hartley, the doctrine of association, he was certainly the first to do justice to the applications of that principle to explain the phenomena of the mind. He points out how it is involved in the conversion of our sensations into ideas, throughout all the senses, and also in the first origin of voluntary power, which he truly regards as essentially an acquired power. He then treats of the commonly recognized intellectual faculties—memory, imagination, reason, etc.—showing how widely the process of association pervades them all. Lastly, the emotions, which he classifies under 6 heads—imaginative emotions, ambition, self-interest, sympathy, theopathy, (the religious sentiment), and the moral sense—may be readily seen to be, in a great many instances, the products of association, there being certain elementary feelings that unite among themselves, and pass into new connections, and give birth to complex feelings, under the general law. Many of those explanations would be considered now as faulty or defective; but at the time, Hartley's attempt was a great step in advance, and might have been much more fruitful in consequences to mental science, but for the unfortunate and mistaken prejudice excited by the vibration theory, which he carries out into every part of his exposition.

HARTMANN VON DER AUE, or VON AUE, one of the old German poets, b. about 1170, was a Swabian knight. He had probably begun the study of grammar, knew French when he joined the crusade in 1197, and, as he himself says, could obtain, by his own reading, material for his narrative poems. Of these the first was *Erec* (the legend reproduced in Enid of Tennyson's *Idyls of the King*), written shortly before 1197, and edited by Haupt (1839); the last was *Iwein*, written before 1204, and edited by Benecke and Lachmann (1827; 2d ed. 1843), with a dictionary by Benecke (1833). Both of these are drawn from the Arthurian cycle of legends; and their natural development of events displays a completer mastery of their material than the more incoherent British narratives which form their basis. Between the composition of these two poems, Hartmann wrote the religious legends, *Gregor auf dem Steine* (ed. by Lachmann, 1838), which was read in churches till the 16th c., and *Der arme Heinrich* (Longfellow's *Golden Legend*), which has been edited by W. Muller (1842), and also along with Hartmann's *Lieder und Büchlein*, by Haupt (1842). By these works, which have all been translated into modern German, Hartmann was known among his contemporaries. Gottfried von Strasburg, in his *Tristan*, written about 1207, praises him as still alive; and his death is lamented about 1220, by Heinrich von dem Türlein, in his *Krone*.

HARTMANN, EDUARD VON, a philosopher, b. in Berlin, 1840. Educated at the gymnasium and the school of artillery, he was commissioned as an officer in 1861; but the following year an accidental injury of his foot produced a disease which has proved to be incurable and has confined him to his room and, in a great degree, to his bed, where his time and thoughts have been devoted to philosophical inquiries. The principal work thus produced is *The philosophy of the unconscious*, in which taking his stand at the meeting point of the unconscious and the conscious, of natural science and philosophy, of the brain and the mind, he endeavors to trace and state the nexus between them. The unconscious in nature has, he says, both a will, which is not merely (according to Schopenhauer's theory) "irrational" but is able to determine itself to prototypal ideas; and also an idea which is not merely (according to Hegel's theory) "logical" but is capable of attaining reality by will. In the mind this unconscious will and idea are to be found in the "first principles," and are at work in the instincts, love, emotions, morals, æsthetics, and language. This book has awakened considerable interest in Germany and made its author eminent among the thinkers of the age. It is not yet evident, however, that he has solved the problem of the unconscious in nature, or of the nexus between the conscious and unconscious in man's complex being, though he has freshened the problem by setting it forth in novel terms.

HARTMANN, MORITZ, 1821–72; a German poet, b. Bohemia, of Jewish parents. He studied at Prague and Vienna, and, after a tour in Italy, Switzerland and south Germany, became a teacher in Vienna. He left Austria, to publish without danger a volume of poems entitled *Kelch und Schwert*, in which he gave expression to radical sentiments as regards both church and state. After residing for some years in Belgium and France, he came to Leipsic, where in 1847 he published *Neuere Gedichte*. Returning to Austria he suffered a short imprisonment, from which he was freed by the revolution of March, 1848. In the same year he was chosen to represent the district of Leitmeritz in the Frankfort parliament, where he took his seat on the extreme left. In Oct. he accompanied Blum and Fröbel to Vienna, but he made his escape before the execution of Blum, and took part in the deliberations of the "Rump Parliament" at Stuttgart. In 1849 he published the *Reimchronkik des Pfaffen Maurizius*, a satirical political poem in the style of the old chronicles. After the dissolution of the rump parliament he went to Switzerland, then to England and Ireland, and in 1850 to Paris, where, beside other literary engagements, he held that of correspondent to the *Kolnische Zeitung*. On the outbreak of the Russian war, he became correspondent of the same paper in the Crimea, where he remained 18 months. After several years' residence at Paris he settled in 1860 at Ghent, where he delivered courses of lectures on German literature and his-

tory in some of the principal academies. In 1863 he removed to Stuttgart to edit the *Freya*, and in 1868 he undertook editorship at Vienna of the *Neue Freie Presse*. Hartmann published several volumes of poems in addition to those mentioned, and besides his spirited accounts of his travels and adventures he is the author of various novels of more than average merit.

HARTO'GIA, a genus of trees, or shrubs, of the natural order *celestraceæ*. *H. capensis*, a native of the cape of Good Hope, is only 10 or 15 ft. high, but the trunk is a foot to a foot and a half in diameter. The wood is hard, fine-grained, close, and tough; it is much valued, and when polished, is superior to the finest mahogany. It is often used for veneering. The Dutch colonists call it *ladlewood*, probably from one of the first uses to which they found it convenient to apply it.

HARTRANFT, JOHN FREDERIC, b. Penn. 1830; graduated at Union college, and was admitted to the bar in 1859. He was an early volunteer on the union side in the war of the rebellion, and was aide-de-camp to gen. Franklin in the first battle of Bull Run. In July, 1861, he was in the Burnside expedition and led the 51st Pennsylvania regiment in the attack on Roanoke island, and in the battle near Newbern, in March, 1862. At Antietam he led his regiment in a brilliant and successful charge. After fighting gallantly at Fredericksburg he was ordered to Kentucky. In June, 1863, he was in command of a brigade at Vicksburg, and afterwards was with Sherman in the advance to Jackson, Miss. He was in other actions, particularly the battle of the Wilderness, and in May, 1864, became brig.gen. On March 25, 1865, he recaptured fort Steadman, before Richmond, displaying great bravery, for which he was brevetted maj.gen. After the war he was twice chosen auditor-general of Pennsylvania, and in 1872 was elected governor.

HARTSHORN, the term given in pharmacy to the antlers of the *cervus elaphus*. Its composition is very different from that of persistent horns, as those of the ox, for example, and is identical, or nearly so, with that of bone. The products of its distillation were formerly much used in medicine, under the titles of oil of hartshorn, volatile salt of hartshorn, spirits of hartshorn, etc.; but they are now replaced by simpler preparations of the active ingredients of these substances, namely, ammonia and carbonate of ammonia. See AMMONIA.

HARTSHORNE, JOSEPH, 1779–1850; b. Va.; studied medicine in Pennsylvania university, and graduated in 1805. After traveling in the East Indies he settled in Philadelphia, and became one of the surgeons of the state hospital. He was a member of the society of Friends, and his first ancestor in America was an associate with William Penn in the government of east Jersey. Two of his sons (Edward and Henry) are eminent as physicians and surgeons, and both have written largely on medical themes.

HART'S, or SPECTACLE, ISLAND, in Long Island sound, about 25 m. e. of New York. It is owned by the city, and on it are the industrial school, the city cemetery, a branch of the lunatic asylum, and a branch of the almshouse. The public burying-ground, or potter's field, receives annually nearly 2000 unidentified bodies. It contains only one monument, and that is to unknown soldiers. The industrial school, under the care of the commissioner of charities and correction, has usually 300 pupils.

HART'S-TONGUE, *Scolopendrium*, a genus of ferns, of which one species, *S. vulgare*, is a native of Britain, and is common in most parts of the country, in moist woods, shady banks, caves on the sea-shore, and other cold and damp situations. It is also found on the continents of Europe and in North America. It is very different in appearance from every other British fern, its fronds being, in general, quite undivided—although sometimes, by monstrosity, they are forked and even multipartite—linear, from a few inches to two feet in length, and from an inch to two or three inches in breadth. The *sori* are in transverse lines, on the lateral nerves. Fine plants of this fern have a very ornamental appearance, and are in their greatest luxuriance in winter.

HARTSUFF, GEORGE L., 1830–74; b. N. Y.; graduated at West Point; served on the frontier and in Florida, and was seriously wounded in a fight with the Seminoles. In the war of the rebellion he served with bravery until severely wounded at Antietam, being chief of staff to gen. Rosecranz, and brig.gen. In March, 1865, he was again in the field and took command of Petersburg after its capture. In 1871 he was retired with the rank of maj.gen.

HARTSVILLE, a village of Barthlomew co., Ind., 48 m. s.s.e. of Indianapolis. It is the seat of Hartsville college, organized in 1851 under charge of the Moravians, or United brethren.

HARTWICK, a village in Otsego co., N. Y., 68 m. w. of Albany on the Cooperstown and Susquehanna Valley railroad; pop. of town '75, 2,180. Near by is the Hartwick theological seminary, under Lutheran management. It has water power and a few manufactories.

HARTWIG, JOHN CHRISTOPHER, 1716–96; a German Lutheran preacher, chaplain in the English army, and on duty in America. He was in the first Lutheran synod held in the country in 1748; preached in several cities and towns, and was the founder of

Hartwick theological seminary, Hartwick, N. Y. It is said that he predicted at the age of 40 that his death would occur (as it did) on his 80th birthday

HARTZENBUSCH, JUAN EUGENIO, a modern Spanish dramatic poet of German extraction, was b. at Madrid, Nov. 6, 1806, studied under the Jesuits, and produced his first work, *Amantes de Teruel*, in 1836. His principal works since then, all of which have been published at Madrid, are *Doña Mencia* (1838); *La Redoma Encantada* (1839); *La Visionaria* (1840); *Alfonso el Casto* (1841); *Primero Yo* (1842); *Honoria* (1842); *El Buchiller Mendarias* (1842); *La Coja y el Encogido* (1843); *La Madre de Pelayo* (1846), and *El mal Apostol* (1864). He has also published prose works: *Cuentos y Fabulas* (1861); *Obras Escogidas* (1863); and *Obras de Encargo* (1864). His writings are characterized by glowing imagination, vigorous diction, and sonorous versification. Hartzenbusch is considered one of the most original of the living poets of Spain. He is also one of the few who possess any solid knowledge of German literature.

HARUGARI, an order in the United States, composed chiefly of Germans started in 1847, and supposed to number over 20,000 members. Its aims are social and benevolent, and particularly the preservation of the German language. There are a general or national lodge, state lodges, and about 240 subordinate lodges.

HÂRÛN, surnamed, AL-RASCHÎD, i.e., the just, the most renowned of the Abbaside caliphs, succeeded his elder brother, Haudi, in the caliphate, in the year 786, not having yet attained his twenty-first year. Various insurrections in the interior of the kingdom were speedily put down, and the wars against the Byzantines and the Chasars brought to an end. Though the boundaries of the vast empire, which extended from the Caucasus to the sources of the Nile, were not enlarged, the empire lost none of its provinces. Hârûn gave himself up unreservedly to the pleasures of life, leaving the entire administration of his extensive kingdom in the hands of Yahya, the Barmecide, and his four sons; and the energy of their administration, the enforcement of order, and the general prosperity of the country proved that his confidence was not misplaced. His capital city of Bagdad he rendered the most flourishing city of that period. Tribute was paid to him from all quarters, and splendid edifices were erected by him at a prodigious cost. At the same time, he was the patron of learning, poetry, and music, and his court was the resort of the most eminent Mohammedans of the age. He was celebrated in countless songs and narratives; and is the hero of several of the stories in the *Arabian Nights*. Towards the end of his reign, he conceived a rooted hatred towards the Barmecides (see BARMECIDES); yet so well did he know their tried fidelity, that he suffered the reins of government to remain in their hands for some years afterwards. In 803 he caused the vizier, his four sons, and all their descendants, one only excepted, to be executed, not even excepting his favorite Jaafer, who had been his companion in his nocturnal rambles through the streets of Bagdad. On the destruction of this family, his affairs fell immediately into irretrievable confusion; treason and rebellion, no longer dreading the far-reaching arm of the able vizier, showed themselves in every corner of the empire; and now, when it was too late, Hârûn thought with bitter regret of his savage cruelty to that able family. The most formidable of these insurrections having broken out in Khorassan, in the n.e. of the empire, Hârûn marched in person against the rebels. But an attack of apoplexy obliged him to remain behind in Tûs, where he soon afterwards died, in the month of March, 809. The tales of the *Arabian Nights* have thrown a false halo round his memory, for though he was undoubtedly the most enlightened monarch of the age, yet, like the most of the Abbaside race, he could, when it suited him, act to perfection the part of the avaricious and bloody tyrant.

HARUSPICES. The word *haruspex*, or *aruspex*, is probably derived from an old Latin word, *haruga*, a victim, or *hira*, intestines, and the root *spec-*, to see or look. The haruspices seem to have come originally from Etruria, whence the Romans derive many of their religious institutions. Their art, *haruspicina*, which in many respects was like that of the Augurs (see AUGURIES AND AUSPICES), consisted in interpreting the will of the gods by inspecting the entrails of the animals offered in sacrifice (hence they are also called *extispices*), and by observing other circumstances connected with the offerings, such as the willingness or unwillingness of the victim to come to the altar, the flame, the smoke, etc. They took indications also from earthquakes, lightning, and all other extraordinary phenomena of nature called *portenta*. The haruspices did not equal the augurs in dignity and respect; they were regarded rather as *media* of communication with heaven, than as possessing any independent religious authority. They had no organization, like the augurs; they did not, in earlier times, at least, form a *collegium*, nor had they a *magister*. They were, however, at one time considered of great importance; but latterly their art fell into disrepute with the more intelligent portion of the Roman citizens. Cato is alleged to have said that "he wondered that one haruspex did not laugh when he saw another." Some of the later emperors, especially Alexander Severus, endeavored to revive and encourage the art of the haruspices, but it was finally abolished by Constantine. Their sacred books were called *libri haruspicini*, *fulgurales*, and *tonitruales*.

HARVARD, JOHN, 1608–38; b. England, and educated at Cambridge university. In 1637 he emigrated to Massachusetts where he was made a freeman, and performed

the duties of a minister. By his will one-half of his estate was given towards founding a college, and his books were given to the prospective library. The bequest was about $4,000, and in 1642 Harvard college was opened under the name of its chief donor.

HARVARD COLLEGE, the oldest college in the United States, often termed a university, was founded at Cambridge, Mass., 3 m. from Boston, in 1636, only six years after the settlement of the colony, £800 having been appropriated in three sums for the support of "a schoale or colledge." In 1639 this "schoale" was named Harvard college, in honor of the rev. John Harvard, who gave it £700. It has been well endowed by private liberality, chiefly that of the merchants of Boston, and has, besides its valuable landed property, 1,000,000 dollars of invested funds. At its first establishment this now flourishing college was little more than an Indian school. Many Indian youth were received, but only one ever graduated. They were found utterly unfit for the life, pursuits, and studies of civilization, and those partly educated went back to their forests and wigwams. The first president of Harvard was the rev. Henry Dunster, 1640. In 1764 the library was destroyed by fire; the only works saved being an oriental collection, bequeathed by Dr. Lightfoot, and the Greek and Roman classics, presented by bishop Berkeley. In 1848 a scientific department was generously endowed by Abbott Lawrence, for the benefit of persons who do not wish to pursue the full course. The government is vested in the president, five fellows, and treasurer, with a board of overseers, elected by and from among the alumni of the university. Connected with the college are seven professional schools of law, theology, medicine, science, mining, dentistry, and agriculture. The buildings of the university, consisting of halls, dormitories, chapels, museum, etc., are very extensive. There were, in 1874, 110 professors and tutors, 1174 students, and libraries of 200,000 volumes.

HARVARD COLLEGE (*ante*), or more properly HARVARD UNIVERSITY, by which title the institution has been known for many years past, comprehends the following departments: The college proper, the Lawrence scientific school, the divinity school, the law school, the medical school, the dental school, the botanic garden and herbarium, the Bussey institution of agriculture and horticulture, the Peabody museum of American archæology and ethnology, the museum of comparative zoology, the astronomical observatory, and the library. Of these the college proper, or the academical department, is of course the oldest, dating from the original foundation of the institution in 1636; the medical department, established in 1782, is the next in age; then follows the divinity school, established in 1817, at the time of the Unitarian controversy in Massachusetts. The other departments are of more recent establishment, the law school having been founded in 1817, but opened in its present building in 1832; the Lawrence scientific school in 1848, and the dental school in 1868. The museum of comparative zoology and the Peabody museum of American archæology and ethnology, though connected with the university, are affected in their relation to it by peculiar provisions, being responsible in some degree to separate governing boards. The astronomical observatory and the library have been regarded as separate departments of the university system only during the past few years. The government of the university is vested in two bodies, the corporation and the board of overseers. The corporation is made up of the president, the treasurer, and five fellows, the president and treasurer being chosen by the fellows, who are a self-perpetuating body. The corporation initiates all measures concerning the college, is responsible for the care of its funds, and elects the officers of instruction and government in the various departments, subject to the ratification and final action of the board of overseers. The board of overseers, originally consisting of the congregational ministers in Cambridge and the adjoining towns, was subsequently elected by the state legislature, but since 1866 has consisted of 30 of the alumni of the university, five of whom are elected annually for the term of six years. The president of the university is president of the faculties of the several departments, each of which has a distinct dean. All the departments enumerated above are located in Cambridge, with the exception of the medical and dental schools, and the Bussey institution, which are in Boston. The buildings are for the most part situated on a level plain in Old Cambridge, 3 m. w. of Boston. Those used as dormitories for the students are Hollis hall, Stoughton hall, Holworthy hall, Thayer hall, Weld hall, Matthews hall, Gray's hall, Holyoke house, and college house. Boylston hall, Harvard hall, university hall, Massachusetts hall, Holden chapel, and Seaver hall, are employed either for recitation rooms or for laboratory or other miscellaneous use. The Lawrence scientific school, the law school, the divinity school, the Peabody museum, the museum of comparative zoology, the observatory, and the botanic garden, have one building each for their respective uses. The Hemenway gymnasium was completed in 1880. The largest and costliest of the university buildings is Memorial hall, erected 1870–76 as a memorial of the students of the university who fell in the union army during the rebellion. This building consists of three parts: the memorial vestibule, containing tablets giving the names of the dead, the large dining hall, surrounded with portraits and busts of the benefactors of the university; and Sanders theater, in the semi-circular auditorium of which the commencement and other leading public exercises of the university are held. Memorial hall cost about $500,000, and is the largest single college edifice in the world, the dining hall alone, it is claimed, being one-third larger than the largest of the English university

halls. The other buildings of the university are the medical and dental schools, in Boston proper, and the building of the Bussey institution, near Jamaica plain, within the Boston city limits. The oldest building is Massachusetts hall, built in 1720; the most recent is Seaver hall, built in 1880. The general arrangement of the buildings in the college yard in Cambridge is in the form of quadrangles, of which the western one is now completed, while the eastern is being gradually filled up. The university owns a brick house for the president. The library is housed in Gore hall, which aims to be a copy of king's college chapel, in Cambridge, England, and which has recently been considerably enlarged. Wadsworth house is the name which has of late years been given to the old president's house, within the college yard, occupied by the presidents of the university from 1726 to 1849, but now rented by the college as a dormitory for professors and students. Appleton chapel occupied for daily morning prayers during the academic year, and for Sunday services for those students not having other church connections, was built in 1858.

The course of study in the college proper is of four years, and leads to the degree of bachelor of arts, but the elective system of studies has been employed at Harvard to a far greater extent than in any other American college, the required studies being virtually limited to the freshman year. Even in mathematics the lecture system largely takes the place of the old method of instruction by text books. The course in the law school, leading to the degree of bachelor of laws, has recently been extended to three years; and in the medical school three full years of study are now required of candidates for the degree of doctor of medicine. The course in the scientific school is four years, in the dental school two years, and in the divinity school three years; while in the other departments the length of study is not rigidly prescribed. The university at present confers no degrees on students without examination, one year of study being a pre-requisite to the degree of master of arts, two years to that of doctor of philosophy, and two years to that of doctor of science. The number of candidates for these three degrees—established during the past decade—is usually about sixty. The examinations, however, are so rigid that the number of degrees annually conferred is much smaller than this figure. The whole number of officers of instruction and government is about 150. The number of students in all the departments of the university has for the past few years exceeded 1300, of which about 800 have been in the college proper. Of these, considerably more than half are from the state of Massachusetts. The whole number of alumni of the college proper (to 1879) is 9,175; the number of graduates of all departments (to 1875) is 12,812. The amount of the invested funds of the university, exclusive of the value of the grounds, buildings, books, and apparatus, was, Aug. 31, 1879, $3,902,181.73. The whole number of bound volumes in the college library and the department libraries is about 200,000, of bound volumes, and pamphlets, about 500,000. The present president of Harvard university is Charles William Eliot, LL.D., a graduate of the class of 1853. He was elected to the office in 1869, and to his administration have been chiefly due the distinguishing changes which have marked the recent management of the university, especially in the introduction of the elective system in the college proper and in lengthening the term of study required in the law and medical schools. The government of the university, which, for a generation after the schism which divided the New England Congregational churches in the first quarter of the present century, was under Unitarian control, is now neutral in its attitudes towards religion.

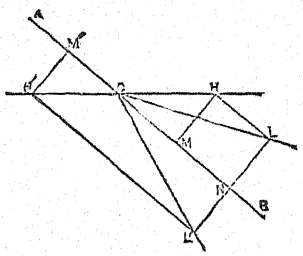
HARVEST (Ger. *herbst*, autumn; probably allied to Gr. *harp-*, Lat. *carp-*, to snatch, pluck, gather), the season of gathering and storing the chief products of the fields. The most important harvest operations are those connected with the cutting down of the grain crops, in which, as well as in the mowing of hay (q.v.), machines moved by horses are now extensively used. See REAPING.

HARVEST BUG, *Leptus autumnalis*, is an animal of the *acarus* tribe, which derives its popular name from its attacking the laborers employed in the harvest. As the acari in their perfect state are usually provided with eight feet, and in their larval stage with only six feet, and as the harvest bug has only the latter number, it was suspected by Siebold, and it has been since proved, that this animal is the larva of one of the trombidida, a family of acaridans. It is so minute, that, were it not for the brilliancy of its color, which is a vivid crimson, it would be quite invisible. It makes its appearance, or rather renders us conscious of its presence, about the middle of July, and disappears towards the middle of Sept., and is most plentiful in hot dry seasons. It occurs on the blades of grass, and on various plants in fields, gardens, and woods, and attacks not only man, but the dog, cat, etc. Persons with delicate skins are its special prey, and it seems to prefer the legs, the under part of the thighs, and the lower part of the abdomen. The wound it inflicts—how produced is not well understood—occasions insupportable irritation, which usually leads the victims to scratch themselves, and thus to increase the inflammation. The skin becomes swollen and red, and sometimes even purple; and the minute vesicles caused by these animals sometimes terminate in suppuration.

HARVEST-FLY, the popular name in the United States for species of *cicada* (q.v.) which are common in that country, and make their appearance as winged insects in the

season of harvest. *C. septemdecim* is called the *seventeen years' locust*, from a popular belief that it lives for that period in its larval state, a belief which seems to have arisen from the appearance of these insects in unusual numbers at intervals of about seventeen years. Its color is black, the wings and wing-covers veined with orange red. Near the tips of the wing-covers there is a dusky zigzag line in the form of the letter W, on account of which the appearance of this fly in great numbers is superstitiously regarded as indicative of approaching war.

HARVEST MOON. In our latitudes, at the time of full moon nearest the autumnal equinox, it happens that the moon rises for several days nearly at sunset, and about the same time by the clock, instead of rising, as it usually does, 52′ later on one day than on the preceding. This phenomenon is owing to the fact, that at this time the moon is in Aries, when the part of the ecliptic below the horizon makes the least angle with it, as shown in the following figure, where AB represents a portion of the equator; H′CH, a portion of the horizon; CL, a portion of the ecliptic when C represents the equinoctial point of Aries; CL′, a portion of the same if C were the equinoctial point of Libra. Then (supposing the moon to move in the ecliptic, a supposition not far from the truth, and one which greatly simplifies the explanation of this phenomenon), if the moon be at C (point of Aries) on one night, it will have retrograded to L by the same time on the following night; and, by the revolution of the earth in the direction of NM′, will appear on the horizon at H, and the distance LH reduced to time will give the moon's retardation. If C be the equinoctial point of Libra, then L′ will be the moon's position on the second night, and it will rise at H′ after the earth has revolved so as to carry the whole of the line H′L′ above the horizon; this line, when reduced to time, gives the retardation. Hence, as the moon when at the full is in Aries at the sun's autumnal equinox, and in Libra at the sun's spring equinox, the retardation is least in the first instance and greatest in the second, being respectively CN — CM, and CN + CM′ = CN + CM. In the latitude of Edinburgh (55° 58′) the greatest retardation is 1 hour 8′ 24″, and the least 11′ 44″; in lat. 64° 27′, the least retardation is zero, or the moon rises at the same time on two successive evenings, while at the arctic circle (67° 30′) it rises 4′ earlier on the second evening. As this phenomenon occurs at a time (about Sept. 23) when the farmer is busy with his harvest, and very opportunely supplies him for several evenings with light sufficient to continue his operations after sunset, the moon at this stage has received the name of "harvest moon." As the moon's orbit is inclined to the ecliptic, this irregularity will be increased or diminished according as the ascending node is between Capricorn and Cancer, or between Cancer and Capricorn. It is nothing at the equator, increasing as we proceed north. At our antipodes the greatest retardation occurs in Sept., and the least in March.



HARVEY, a co. in s. central Kansas on the Little Arkansas river, crossed by the Atchison, Topeka and Santa Fé railroad; 540 sq.m.; pop. '78, 8,107. It has a level surface and is nearly all prarie. Soil fertile, producing corn, wheat, oats, etc. Co. seat, Newton.

HARVEY, Sir GEORGE, P.R.S.A., an eminent artist, was b. at St. Ninians, near Stirling, in 1806. Displaying a taste for drawing, he was at the age of 18 placed in the school of the trustees' academy, Edinburgh, where he made rapid progress. In 1826, when the royal Scottish academy was instituted, he was elected an associate, and in 1829 an academician. He was a constant contributor to the academy's exhibitions, and many of his works are well known through the medium of engravings. The principal of these are—"Covenanters Preaching," "Battle of Drumclog," "The First Reading of the Bible in Old St. Paul's," "The Curlers," "Columbus discovering America," and "Quitting the Manse." Harvey did not confine himself to historical art, some of his most successful works being representations of Scotch scenery. His landscapes are remarkable for pastoral peace, and some of the more imaginative for a singular solemnity of atmospheric effect. He was elected president of the royal Scottish academy in 1864, and knighted in 1867. He died in 1876.

HARVEY, WILLIAM, the discoverer of the circulation of the blood, was b. at Folkstone, in Kent, on April 1, 1578. His father was a yeoman; and five of his brothers were merchants of weight and substance, *magni et copiosi*, in the city of London, while the sixth sat as member of parliament for Hythe.

After six years' attendance at the grammar-school at Canterbury, Harvey, being then 16 years of age, was entered at Caius college, Cambridge. He took his first degree in arts in 1597, and having selected physic for his profession, left Cambridge about the year 1590, and proceeded to the university of Padua, then the most celebrated school of medicine in the world. Having passed five years at that school in attendance on the lectures of Fabricius de Aquapendente, Julius Casserius, and other eminent men, who then adorned that university, he obtained his diploma as doctor of medicine in 1602. He returned to England in the same year; and after receiving his doctor's degree from

his original university, Cambridge, settled in London as a physician. In 1609 he was appointed physician to St. Bartholomew's hospital, and in 1615 Lumleian lecturer at the college of physicians—an office then held for life; and it is generally supposed that in his first course of lectures (in the spring of 1616) he expounded those original and complete views of the circulation of the blood with which his name is indelibly associated. It was not till the year 1628 that he gave his views to the world at large, in his celebrated treatise entitled *Exercitatio Anatomica de Motu Cordis et Sanguinis* (4to, Franc.), having then, as he states in the preface, for nine years or more gone on demonstrating the subject in his college lectures, illustrating it by new and additional arguments, and freeing it from the objections raised by the skillful amongst anatomists. Shortly after Harvey's election as Lumleian lecturer (in 1617 or 1618), he was appointed physician-extraordinary to James I., and in the beginning of 1630 was engaged "to accompany the young duke of Lennox in his travels beyond seas." In 1632 he was formally chosen physician to Charles I.; and in 1633 we find that his absence, "by reason of his attendance on the king's majesty," from St. Bartholomew's hospital was complained of, and that Dr. Andrews was appointed as his substitute, "but without prejudice to him in his yearly fee or in any other respect"—a procedure which shows the esteem in which Harvey was held. We learn from Aubrey that he accompanied Thomas Howard, earl of Arundel, in his embassy to the emperor in 1636; and during this journey he publicly demonstrated to Caspar Hofmann, the distinguished professor of Nuremberg, and one of the chief opponents of his views, the anatomical particulars which made the circulation of the blood a necessary conclusion—a demonstration which, it is reported, was satisfactory to all present save Hofmann himself, who still continued to urge futile objections. He attended the king in his various expeditions, and was present with him at the battle of Edgehill (Oct. 23, 1642). "During the fight," says Aubrey, "the prince and duke of York were committed to his care. He told me that he withdrew with them under a hedge, and tooke out of his pockett a booke, and read. But he had not read very long before a bullet of a great gun grazed on the ground neare him, which made him remove his station." He accompanied the king after the battle to Oxford, where, according to the same authority, "he came several times to our college (Trinity), to George Bathurst, B.D., who had a hen to hatch eggs in his chamber, which they opened daily to see the progress and way of generation;" and where the honorary degree of doctor of physic was conferred on him in the Dec. of that year. In 1645 he was, by the king's mandate, elected warden of Merton college; but on the surrender of Oxford to the parliament in July, 1646, he left the university, and returned to London. He was now 68 years of age, and seems to have withdrawn himself from practice, and from all further participation in the fortunes of his royal master. During the remainder of his life, he was usually the guest of one or other of his brothers, now men of wealth and high standing in the city; and it was at the country-house of one of them that Dr. Ent visited him at Christmas, 1650, and after "many difficulties" (see Dr. Ent's epistle dedicatory, in Willis's translation of Harvey's works) obtained from him the MS. of his work on the generation of animals, which was published in the following year, under the title of *Exercitationes de Generatione Animalium, quibus accedunt quædam de Partû, de Membranis ac Tumoribus Uteri, et de Conceptione*, 4to.

From this period to the time of his death, the chief object which occupied his mind was the welfare and improvement of the college of physicians, to the buildings of which he erected a handsome addition at his own cost. In 1654 he was elected, in his absence, president of the college, but he declined the office, on account of his age and infirmities. In July, 1656, he resigned his Lumleian lectureship, which he had held for more than forty years; and in taking leave of the college, presented to it his patrimonial estate at Burmarsh, in Kent, then valued at £56 per annum. He did not long survive, but, worn down by repeated attacks of gout, died at London, June 3, 1657, and was buried in a vault at Hempstead, in Essex, which his brother Elia had built.

A handsome edition of Harvey's works, in Latin, revised by Drs. Lawrence and Mark Akenside, was published by the college of physicians in 1766. The best edition, in English, is that of Dr. Willis, published by the Sydenham society in 1847.

HARWICH, a municipal and parliamentary borough, seaport, and market-town of England, in the co. of Essex, is pleasantly situated on an elevated and healthy site near the n.e. extremity of a promontory 66 m. n.e. of London. Southward from the town extends an esplanade, from which fine views of the harbor and the German ocean may be obtained. The chief branches of industry are the manufacture of Roman cement, and of artificial manure from coprolites (q.v.), fishing, and shipbuilding. Steamers run daily to Ipswich, and in summer there is steam communication with London. The harbor of Harwich, formed by the junction of the Stour and the Orwell, is said to be the best on the e. coast of England. It is capacious, safe, and commodious; but its entrance is rocky, and, although there are two lighthouses and numerous buoys, cannot be entered without careful navigation. Harwich has been made a harbor of refuge. The battery by which the town is defended was erected about 1820, at which time a considerable space intervened between it and the usual tide-mark; but so great have been the encroachments made by the sea on the promontory on which Harwich stands, that two jetties or groins, 1350 ft. and 1000 ft. long respectively, have been

constructed to prevent its nearer approach; and these have proved very successful. In 1875, 878 vessels of 239,738 tons entered, and 897 of 223,021 tons cleared the port. Pop. '71, 6,079.

HARZ MOUNTAINS, a broad mountain-range in the n. of Germany, extends e.s.e. from Goslar and Osterode in Hanover to Hettstädt and Mansfield in Prussian Saxony. It forms an elevated plateau, covered with irregular and, for the most part, forest-clad mountains, and situated mainly in Hanover and Brunswick. The range, which is divided into upper and lower Harz, is 50 m. in length, about 16 m. in breadth, and covers a superficies of upwards of 750 sq. miles. It is composed for the most part of greywacke belonging to the Devonian formation, and broken through in one or two places by granite, as in the Brocken (q.v.) and the Rammberg. The highest peak of the range is the Brocken. The Harz mountains are exceedingly rich in metals and minerals. Silver, iron, lead, copper, zinc, etc. are mined; marble, alabaster, and granite are quarried. Mining, stone-cutting, and the timber-trade afford employment to the inhabitants, who are about 76,000 in number. The Harz mountains are the scenes of many of the wild legendary tales of German literature.

HASAN AND HUSEIN, the title of a passion-play, performed annually throughout India and Persia by a traveling company of Shiah Mohammedans. The title of the piece presents also the names of its heroes, two brothers nearly related to Mohammed, the first of whom was caliph after Ali, the son-in-law of Mohammed. The two brothers, in whom rested the title to the office of guardian of the caaba or temple of Mecca, were foully assassinated, which act gave rise to the formation of the party known as Shiah, or "sectarian" Mohammedans, and produced a schism in Islam, which exists to this day.

HASDRUBAL, more correctly ASDRUBAL (*one helped by Baal*), a name of frequent occurrence in Carthaginian history, there being nearly twenty more or less celebrated individuals so called. One of the best known is that son-in-law of Hamilcar (see HAMILCAR BARCA), who accompanied his father-in-law to Spain (236 B.C.), and for eight years after the death of the latter, continued to carry out the plans of his great kinsman. The empire which the military talent and energy of Hamilcar had founded was consolidated by the skillful statesmanship of Hasdrubal. He formed the s. and e. coasts of Spain into Carthaginian provinces, and founded many towns, the most famous of which was Carthago Novo (now *Cartagena*), possessing a fine harbor, and having in its neighborhood rich mines. This city he adorned with a splendid "royal palace." Under his direction, agriculture flourished; mining was vigorously prosecuted; the tribes as far north as the Ebro became subject to Carthage, and paid tribute: and powerful chiefs were attached to Carthaginian interests by intermarriage and other means. Hasdrubal was at length (220 B.C.) murdered by a slave, whose master he had put to death. He was a leader of the popular party at Carthage after the conclusion of the first Punic war, and was early brought out into public life. He was a skillful general, and showed great energy and prudence in a war with the Numidian tribes. But his talents were more particularly administrative, as has been already seen in his Spanish government. So powerful was he in Spain, and so independent of the home government, that the Romans made the famous treaty in regard to the Iberus as the common frontier not with the Carthaginians, but with Hasdrubal.

Another Hasdrubal, brother of the great Hannibal, and son of Hamilcar Barca, bore a conspicuous part in the second Punic war, first as the opponent of the Scipios and the conqueror of Cn. Scipio in Spain, and afterwards as the commander of a Punic army in Italy. While he was marching southward to join Hannibal in Umbria, he encountered the Roman consuls, C. Nero and M. Livius, at the river Metaurus. The Romans gained a complete victory; an immense number of the Carthaginian forces were slain; and Hasdrubal himself, when he saw that all was lost, rushed into the midst of the enemy, and fell (207 B.C.) as became the son of the great Hamilcar. In generalship and in military bravery he seems to have been little inferior to his father and brother.

A third Hasdrubal was one of Hannibal's principal officers in his Italian campaigns, and largely contributed, by a well-timed charge, to decide the victory on the great day of Cannæ.—A fourth, called Calvus, i.e., the Bald, led an expedition to Sardinia in 215 B.C., during the second Punic war. He was defeated by the Roman general, and carried to Rome as a captive.—A fifth, son of Gisco, co-operated with Hasdrubal, son of Hamilcar, in Spain, and afterwards, in conjunction with Syphax, unsuccessfully opposed Scipio in Africa (204 B.C.).—The last we shall mention is that unfortunate general to whom fell the hopeless task of defending Carthage against the Romans in the third Punic war. He was at first commander without the city (another Hasdrubal, grandson of the Numidian Masinissa, being general within the city), but he ultimately became sole leader, and opposed all the plans and movements of Scipio with great energy and skill. But at length Carthage fell, and Hasdrubal was carried prisoner to Rome, to adorn the triumph of his conqueror.

HASÉ, KARL AUGUST, an eminent living theologian of Germany, was b. at Steinbach, in Saxony, Aug. 25, 1800, and, after leaving Altenburg gymnasium, studied theology at Leipsic, Erlangen, and Tübingen. For taking part in the *Burschenschaften*, he was, after a tedious trial, confined for five months in the fortress of Hohenasperg.

In 1829, after having been *privat-docent* for a year, he was made extraordinary professor of philosophy in Leipsic, where his lectures on dogmatics and the life of Christ proved especially attractive. He was, indeed, the first critical biographer of Christ who decidedly rose above the old rationalistic conception of Him as merely an excellent moral teacher, his *Leben Jesu* (1829, 5te Aufl. 1865), which appeared six years before Strauss's, having proposed as its aim to show "how Jesus of Nazareth, according to divine destination, by the free act of his own spirit, and by the opportunities of his time, became the Savior of the world." Vindicating equally the rights of the individual religious consciousness, and the historical importance of the church, he opposes modern supernaturalism, as in *Die Leipziger Disputation* (1827), equally with extreme rationalism, as in *Theologische Streitschriften* (1834–37), and *Die Tübinger Schule* (1855). Before the first year of his professorship in Leipsic was over, Hasé was called as professor of theology to Jena, where he still represents the departments of dogmatics and church history principally. His *Hutterus Redivivus* (1827, 10th ed. 1862) seeks to do justice to the old Lutheran dogmatics in contrast with modern systems, by exhibiting its harmonious completeness, and is in extensive use among German theological students. Besides his *Compendium of Universal Church History* (1834, 9th ed. 1867), which has been translated into English, and is unsurpassed for its concise pictures of times, men, and systems, Hasé has treated special portions of church history in *Die beiden Erzbischöfe, Neue Propheten, Franz von Assisi* (1856), and *Das geistliche Schauspiel* (1858). He has also published several works on ecclesiastical law; an edition of the *Libri Symbolici Ecclesiæ Evangelicæ; Ideale und Irrthümer* (1872); etc.

HASHISH' is the oriental name of the plant (or rather of the tops and tender parts of the plant) which is scientifically known as *cannabis indica*, and which we term *Indian hemp*. The medicinal value of the preparations of Indian hemp is described in another article. See HEMP, INDIAN. It is the peculiar intoxication occasioned by the use of hashish that will be now specially noticed.

Various preparations of the plant are employed for the purpose of producing the desired effect. A favorite mode of extracting its active principle is by boiling the tops and flowers with water, to which butter or oil has been added, evaporating, and thus forming an oleaginous solution or fatty extract. This fatty extract is frequently mixed with other substances which are reputed to possess aphrodisiac properties, and is taken in the form of electuary confection, or pastil. The *majoon* used at Calcutta, the *mapouchari* employed at Cairo, and the *dawames* or *dawamesc* of the Arabs, are preparations of this kind.

Dr. Moreau of Tours, who has written an elaborate work on this subject (*Du Hachisch et de l'Alienation Mentale*, 1845), which is based not only on general observation but on personal experience, thus describes the *fantasia*, which is the term employed in the Levant to describe the excitement produced by this agent: "It is really *happiness* which is produced by the hashish; and by this I imply an enjoyment entirely moral, and by no means sensual, as we might be induced to suppose. The hashish-eater is happy, not like the gourmand or the famished man when satisfying his appetite, or the voluptuary in the gratification of his desires, but like him who hears tidings which fill him with joy, like the miser counting his treasures, the gambler who is successful at play, or the ambitious man who is intoxicated with success." (P. 54).

One of the first appreciable effects of the drug, is the gradual weakening of the power of controlling and directing the thoughts. Then comes the stage already described; and accompanying, and in part following it, there are observed errors of sense, false convictions, and the predominance of one or more extravagant ideas. These ideas and convictions are generally not altogether of an imaginary character, but are suggested by external impressions which are erroneously interpreted by the perceptive faculties. Finally, if the dose is sufficiently powerful, there is a complete withdrawal of the mind from external things.

HASKELL, a co. in n. Texas on the Brazos river; 1000 sq. miles. There are as yet no considerable settlements; the census of 1870 returned "no population."

HASLAR HOSPITAL. See GOSPORT.

HASLINGDEN, a small manufacturing and market-town of England, in the co. of Lancashire, is situated in a mountainous district, on and around an eminence 18 m. e.s.e. of Preston. It has a town-hall and mechanics' institute, buildings of recent erection, and a parochial chapel, a handsome edifice, the front of which is 300 years old. There are also chapels and meeting-houses for Baptists, Methodists, Independents, and Primitive Methodists. Cotton and woolen manufactures are extensively carried on. In the vicinity are coal-mines and stone-quarries. Pop. in '71, 7,698.

HASP AND STAPLE, in Scotch law, the ancient form of entering an heir in a burgage subject, i.e., properly situated in a burgh. The heir was made to take hold of the hasp and staple of the door, as a symbol of possession, and then enter and bolt himself in. This form is no longer necessary.

HASSAN, a district of Mysore, India, bounded on the s.w. by the Madras district of south Kanara, and on the s. partly by the state of Coorg, 3,291 sq.m.; pop. '71, 669,971. The main portion of the district consists of the river basin of the Hemavati and its

tributaries. It naturally divides into two portions, the Melnad or hill country, which includes some of the highest ranges of the west Ghats, and the Maidan or plain country, sloping towards the south. The Hemavati which flows into the Cauvery in the extreme s. is the great river of the district; its most important tributary is the Yagachi. The upper slopes of the w. Ghats are abundantly clothed with magnificent forests, and wild animals of all sorts abound. Among the mineral products are kaolin, feldspar, and quartz. The soil of the valleys is a rich red alluvial loam.

HASSAN-BEN-SABAH, the "Old Man of the Mountain" of European story, was founder of the sect of the Assassins (q.v.), likewise denominated Hassanis or Ismanilians.

HASSARD, JOHN R. G., b. New York 1836; graduated at St. John's (Jesuit) college. In 1865 he edited the *Catholic World*, and in 1866 joined the editorial staff of the *New York Tribune*. He published the *Life of Archbishop Hughes* soon after the death of that prelate. He has gained repute as a graphic correspondent, and also as a musical critic of rare capacity and judgment. In the summer of 1876 Mr. Hassard attended the remarkable musical festival at Baireuth, the performance of Wagner's *Nibelungen Ring*, under the direction of the composer, and wrote perhaps the most complete description and criticism of the performance, for the *New York Tribune*, in which he also described with great brilliancy, the centennial exhibition, 1876, and the Cincinnati musical festival, 1878.

HASSAUREK, FRIEDRICH, b. Austria 1832; was in the revolution of 1848, and wounded. The next year he came to America and settled in Cincinnati as a lawyer, afterwards went into journalism, and became prominent as a politician. He was U. S. minister in Ecuador 1861–5, and published his observations (1868) in *Four Years Among the Spanish Americans*. He is, at present (1880), editor of the Cincinnati (O.) *Volksblatt*.

HASSELQUIST, FREDRIK, 1722–52; a Swedish naturalist and traveler. In 1741 he entered the university at Upsala, where his taste for the study of nature was fostered and developed by Linnæus, and where, in 1747, he obtained license in medicine, and published a thesis entitled *De Viribus Plantarum*. On account of the frequently expressed regrets of Linnæus at the lack of information regarding the natural history of Palestine, Hasselquist resolved to undertake a journey to that country, and, a sufficient subscription having been obtained to defray expenses, he, after making himself acquainted with the languages of the Levant, embarked for Smyrna, where he arrived 1749. He visited parts of Asia Minor, Egypt, Cyprus and Palestine, and made large natural history collections; but his constitution, naturally weak, gave way under the fatigues and anxiety of travel, and he died at Smyrna, on his way homewards. His collection reached home in safety, and five years after his death the result of his wanderings were published by Linnæus under the title of *Resa till Heliga Landet förrättad från år* 1749 *till* 1752. The work is divided into two parts, the first consisting of the traveler's journal and letters, and the second of his remarks on the botany, zoology and mineralogy of the countries through which he passed, with observations on the prevalent diseases and their cure, and the state of industry, commerce and the arts. It was translated into French and German in 1762, and into English in 1766.

HASSELT, a t. of Belgium, capital of the province of Limburg, is situated near the center of the province, on the left bank of the Demer, 17 m. w.n.w. of Maastricht. It is well built, is surrounded by walls, and carries on a considerable trade in distilling, and in the manufacture of linen fabrics, lace, and tobacco. Pop. '70, 10,500.

HASSLER, FERDINAND RUDOLPH, 1770–1843; b. Switzerland. He came to America when young, and in 1807 was professor of mathematics in the West Point military academy. He was the first superintendent of the U. S. coast survey, and for many years was chief director of that important work. He was afterwards at the head of the bureau of weights and measures in the treasury department. Among his publications are text-books on science, *System of the Universe*, and valuable reports to congress on weights and measures and other topics.

HASSLER EXPEDITION. The name given to the U. S. coast survey expedition of 1871, on board the steamer *Hassler*, so called in honor of the first superintendent of the coast survey. The expedition included prof. Agassiz, Dr. F. Steindacher of Vienna, ichthyologist; Dr. Thomas Hill of Cambridge, botanist and photographer; Dr. White of Philadelphia, photographer and chemist; J. H. Blake of Cambridge, draughtsman and collector, and L. F. Pourtales of the coast survey, as superintendent of dredging. Mrs. Agassiz was also one of the party. The steamer left Boston Dec. 4, 1871, stopping at St. Thomas, Barbadoes, Pernambuco, Rio Janeiro, Montevideo, San Mathias bay (Patagonia), Possession bay (straits of Magellan), and various other places in the straits; on the coast of Chili, at San Carlos, Lota and Talcahuana; the island of Juan Fernandez, Valparaiso, Caldera, Pisco, Callao, Payta, the Galapagos islands, Panama, Acapulco, Magdalena bay, San Diego, and lastly San Francisco, arriving in Aug., 1872. Reports were made and published of the zoological results of the expedition, but the death of prof. Agassiz prevented the publication of his own valuable scientific observations.

HÂSTINAPURA is the name of the ancient capital of the Kurus (see KURU), frequently mentioned in the Mahâbhârata. The Vishnu-Purâna relates that it was founded by Hastin, washed away by the Ganges—under the reign of Nichakra, who, in consequence of this event, had to remove the seat of his government to Kausâmbi—and at a later period it was undermined by Balarâma. It was situated on the Ganges, and is placed by Lassen, in his map to the *Indische Alterthumskunde*, about 78° l. long. and 28° 50′ n. lat.

HASTINGS, a co. in central Ontario, Canada, traversed by the Grand Trunk railway; 2,337 sq.m.; pop. '71, 48,364. There are many small lakes and streams. Gold has been found. Chief town, Belleville.

HASTINGS, a parliamentary and municipal borough, market-town, and famous watering-place of England, in the co. of Sussex, is picturesquely situated on the shore, and surrounded on all sides except the s., which is open to the sea, by high cliffs. It is distant about 35 m. e. of Chichester, and 74 m. s.e. of London by rail. It consisted formerly of only two streets, intersected by a small stream called the Bourne; but is now a considerable town, many new streets and terraces having been erected within the present century. Stretching westward along the sea-front of the town is the Marine parade, a spacious terrace, which, joined and continued westward by the Grand parade of St. Leonards-on-Sea, forms one of the finest sea-walks in the kingdom. Formerly an insignificant village, situated a mile w. of Hastings, St. Leonards is now the Belgravia of that town, is united with it by lines of handsome houses, and included with it in the population returns. The chief point of interest in Hastings is the ruin of an ancient castle, standing on the summit of the West cliff, and supposed to have been erected previous to the Norman invasion. Fishing is the chief occupation—about 160 boats are employed. Owing to the want of a harbor, the boats have to be pulled up on the beach by means of a rope and windlass worked by horse-power. Hastings is a great resort of pulmonary invalids during the cold season of winter and spring; and in summer has facilities for bathing, though probably less desirable as a residence at this season than many other towns on the southern coast.

Hastings in the beginning of the 10th c. was of sufficient importance to have a mint. Here, as is well known, the Conqueror landed in 1066, and in the immediate vicinity are trances of a camp, said to be that occupied by the Normans on the night previous to their march against the Saxons. (See BATTLE). Under the Confessor, Hastings became a member of the Cinque ports, after which it long continued in great repute for its ship-building. It has returned two members to the imperial parliament since the reign of Edward III. Pop. '71 of parliamentary borough, 33,337.

HASTINGS, a city and seat of justice in Dakotah co., Minn,. at the junction of Vermillion river with the Mississippi, on the Chicago, Milwaukee and St. Paul, and at the terminus of the Hastings and Dakotah railroads, 20 m. s.s.e. of St. Paul; pop. 3,644. The city has a court-house, nearly a dozen churches, three newspapers, and a large number of manufactories. There is a railroad bridge across the Mississippi.

HASTINGS, according to the French chroniclers, the name of a viking or sea-rover of the 9th c. It is uncertain whether he was born in Norway, Denmark, or France, most probably in the second of these countries. The story of his devastations is something appalling. From his youth on to a gray old age his whole delight appears to have been in pillage, rapine, and bloodshed. The shores and cities of France, Spain, Portugal, and Italy are said to have been repeatedly wasted and burned by him and his savage comrades. As the Scandinavian *sagas*, however, speak of several Hastings, the Danish historian Suhm considers that the French chroniclers—who wrote at a much later period—have gathered up the confused fear-begotten traditions of the s.w. of Europe, relating to all the pirates of this name, and applied them to a single personage, who has thus become in their hands rather a type of the ferocious Norse viking, than a historical individual.

HASTINGS, FRANCIS RAWDON, Marquis of; 1754–1826, b. England. He joined the army in his 17th year, and his life thenceforth was entirely spent in the service of his country. From 1773 to 1782 he was engaged with much distinction in the American war, fighting at Bunker hill, Monmouth, Camden, and in other battles. From 1783 to 1813 he held various high appointments at home, and took an active part in the business of the house of lords; from 1813 to 1823 he was governor-general of India, and succeeded in bringing to a happy conclusion the Nepaul war. In 1824–26 he was governor of Malta.

HASTINGS, THOMAS, 1784–1872; b. Conn.; when 12 years old removed to Clinton, N. Y. He became interested in sacred music, and made its study and improvement the chief business of his life. From 1824 to 1832 he edited a religious paper in Utica; then came to New York city as musical instructor and composer, where he published, among other works, *Spiritual Songs*, *Christian Psalmist*, *Mother's Hymn Book*, *History of Forty Choirs*, and *Elements of Vocal Music*.

HASTINGS SAND, the lower division of the Wealden beds, forming a portion of the lower cretaceous period. It consists of a considerable thickness (1000 ft.) of sand, calciferous grit, clay, and shale; and differs very little from the Weald clay, the

upper division of the series, except in being a little more arenaceous. The strata have been deposited in shallow fresh water. The sand often exhibits fine specimens of ripple-marks, and the clay which separates the sand-beds sometimes contains cracks that have been produced by the drying of the bed on exposure. The strata are highly fossiliferous. There are numerous saurian reptiles, including the huge iguanodon and the flying pterodactyl. The remains of several chelonians also occur. The fish belong chiefly to the ganoid or placoid orders, the most remarkable being the lepidotus, whose conical palate teeth and thick square enameled scales are very frequent. The shells belong to genera which inhabit fresh water, such as Paludina, Cyclas, and Unio.
